No.	Name, Military Description, and Age.	Dates.	Operations, Operators, Result.
1859	Weymouth, C., Pt., B, 3d N. H., age 19.	Feb. 11, 11, '65.	Right; circ. Died April 20, 1865; pyæmia.
1860	Wheeland, W. J., Pt., E, 207th Penn., age 32.	April 1, 1, '65.	Left; ant. post. flap. Died April 16, 1865; pyæmia.
1861	Wheeler, S. P., Pt., H, 33d Mass.	May 15, 15, '64.	Left. Died June 14, 1864.
1862 1863	(Whelpley, J., Lieut., D, 1st Maine.	Mar. 25, 25, '65.	Both. Died March 25, 1865.
1864	Whitaker, D., Serg't, A, 88th Penn., age 20.	April 1, 1, '65.	R't; circ.; (fract. left tibia;) fem'l lig. Died April 20, '65; pyæmia.
1865	Whitaker, M., Corp'l, 3d Ohio Battery.	Feb. 5, 5, '64.	Right; circ. Surg. M. Brucker, 23d Indiana. Died Mar. 26, '64.
1866	White, S., Pt., I, 33d Indiana.	July 20, —, '64.	——; (also wound of other leg.) Died July 30, 1864.
1867	White, B. W., Pt., D, 118th Ohio.	May 15, 15, '64.	Right. Died June 12, 1864.
1868	*White, C. D.*, —, 4th Louisiana, age 36.	Dec. 16, 17, '64.	Right; flap. Surg. J. R. Ludlow, U. S. V. Died Jan. 21, 1865.
1869	*White, H. C.*, Pt, H, 1st North Carolina.	July 3, 3, '63.	Right. Surg. J. L. Dunn, 109th Penn. Died July 5, 1863.
1870	White, J. S., Pt., D, 55th Penn., age 40.	May 14, 14, '64.	Right. Died June 14, 1864; exhaustion.
1871	Whiteley, J., Pt., G, 97th New York, age 40.	June 19, 19, '64.	Right; circ. Died July 1, 1864.
1872	Whitman, J. S., Pt., I, 58th Mass.	June 26, 27, '64.	Right. Died July 4, 1864.
1873	Whitney, H. D., Pt., D, 145th Penn.	Dec. 13, 13, '62.	——. Surg. C. S. Wood, 66th N. York. Died Jan. 11, 1863.
1874	Wilcox, D., Serg't, K, 103d Illinois.	Nov. 25, 25, '63.	Right. Surg. E. J. Buck, 18th Wis. Died Dec. 19, 1863.
1875	Wild, W. H., Corp'l, C, 118th Penn., age 31.	Sept. 30, Oct. 1, '64.	Left. Died Oct. 29, '64; pyæmia.
1876	Wiley, A. J., Pt., H, 87th Penn., age 26.	June 1, 2, '64.	Left; circ. Surg. D. F. McKinney, 87th Penn. Gang. Died June 9, 1864: asthenia.
1877	Wilhelm, E., Pt., F, 81st Penn., age 16.	Mar. 25, 26, '65.	Left. Died April 8, 1865.
1878	Wilkes, J., Corp'l, I, 170th New York, age 31.	June 22, 22, '64.	Left. Surg. J. A. Douglass, 11th Mass. Died July 12, 1864.
1879	Wilkon, R., Serg't, C, 1st Louisiana.	June 14, 14, '63.	Right. Died Aug. 10, '63; wound and diarrhœa.
1880	Will, T., Pt., G, 21st Pa. Cavalry, age 39.	June 16, 16, '64.	Right: ant. post. flap. Died July 31, 1864.
1881	Willard, A., Pt., G, 97th New York, age 26.	Sept. 17, 17, '62.	Right. Died October 14, 1862.
1882	Willard, G. W., Corp'l, H, 57th Mass., age 35.	Aug. 19, 20, '64.	R't; circ. Surg. W. V. White, 57th Mass. Died Sept. 16, '64; pyæm.
1883	*Williams, A.*, Pt., —, 13th Miss., age 25.	Sept. 17, 18, '62.	Left; flap. Confed. surg. Died Sept. 21, 1862; pyæmia.
1884	*Williamson, P. G.*, Pt., D, 5th Texas, age 24.	July 3, 3, '63.	Right. Died Sept. 5, 1863; hæmorrhage.
1885	Willis, J., Pt., K, 2d Infantry.	July 3, 4, '63.	Right. Died July 26, 1863.
1886	Wilson, J., Pt., A, 27th Missouri.	Nov. 24, 24, '63.	Right; circ. Surg. B. N. Bond, 27th Missouri. Died.
1887	Wilson, T. A., Capt., B, 146th New York.	April 1, 1, '65.	——. Died April 25, 1865.
1888	*Wimberly, W.*, Pt., D, 46th Tennessee, age 22.	Dec. 16, 17, '64.	Left: lateral flap. Died Dec. 18, 1864; hæmorrhage.
1889	*Winn, J. J.*, Pt., Clynch's Ga. Battery, age 18.	Dec. 13, 14, '64.	Right; flap. Surg. E. Hutchinson, 137th N. Y. Died Jan. 20, '65; pyæmia.
1890	Wood, C., Pt., A, 8th N. Y. H. A., age 20.	June 5, 5, '64.	Right; circ. Dr. A. Garcelon. Died Aug. 1, 1864. *Spec.* 2380.
1891	Woodcock, H., Pt., H, 109th N. York, age 36.	June 17, 18, '64.	Right. Died July 13, '64; shock and irritative fever.
1892	Woolford, J., Pt., G, 19th Col'd Troops, age 27.	July 30, 30, '64.	Left: flap. Surg. F. M. Weld, 27th C. T. Died Aug. 10, 1864; exhaustion.
1893	*Woolford, W. H.*, Pt., A, 4th Virginia, age 24.	May 3, 3, '63.	Right; ant. post. flap; sloughing. Died July 13, 1863.
1894	Wray, T. S., Corp'l, F, 10th Penn. Res., age 33.	May 8, 8, '64.	Right; double flap. Died Sept. 3, 1864.
1895	Wright, G. W., Serg't, G, 3d Vermont.	May 5, 5, '64.	Right. Died May 11, 1864.
1896	Wright, W., Pt., B, 8th Connecticut, age 47.	May 7, 7, '64.	Left. Died June 26, 1864; exhaustion.
1897	Yeagher, F., Corp'l, C, 26th Mich., age 44.	June 17, 17, '64.	Right; circ. Surg. J. W. Wishart, 140th Penn. Hæm.; lig.; gang. Died July 5, '64; see. hæm.
1898	Yockey, P., Pt., D, 29th Ohio, age 29.	July 22, 22, '64.	Right. Sept., 1864, reamp. mid. third. Hæm.; fem. and external iliac art'es ligated. (Also w'nd right arm.) Died April 23, '65; chronic diarrhœa.
1899	Young, M. G., Pt., D, 23d Iowa.	May 17, 17, '63.	Left. Gangrene: diarrhœa. Died August 6, 1863.
1900	Young, W. F., Pt., A, 114th N. York, age 26.	Oct. 19, 19, '64.	Left; lat. flap. Hæm.; inferior perforating artery ligated. Died Nov. 27, 1864; exhaustion.
1901	*Anderson, H.*, Pt., D, 39th Georgia.	Sept. 1, —, '64.	Right; (also w'nd left hip.) Surg. A. C. Messenger, 57th Ohio.
1902	*Barnum, J. C.*, Corp'l, D, 29th Mississippi.	Aug. 31, 31, '64.	Left. Surg. J. A. Lair, 53d Ohio.
1903	*Brockley, W.*, Pt., D, 8th North Carolina.	April 20, 20, '64.	Right; semi-lunar flaps. Surg. C. H. Ladd, C. S. A.
1904	Casner, D., Pt., E, 122d Ohio.	June 1, —, '64.	Left.
1905	Eggleston, A., Pt., D, 111th Penn.	May 15, —, '64.	Right.
1906	*Fender, F. D.*, Pt., G, 1st South Carolina.	Sept. 30, 30, '64.	Left; circular.
1907	Fierhaut, R., Pt., B, 2d P. H. B. Md.	June 17, —, '64.	Right. Not a pensioner.
1908	*Gulledge, J.*, Pt., D, 21st S. Carolina, age 51.	May 16, 17, '64.	——; posterior flap; sloughing.
1909	*Harlien, T.*, Pt., A, 12th Georgia.	June 2, 2, '64.	
1910	McSparrain, J. W., Pt., I, 62d Penn.	May 27, —, '62.	Right. Not on the Pension List.
1911	Nelson, R., Pt., G, 7th Col'd Troops, age 20.	Sept. 29, —, '64.	Left. Not a pensioner.
1912	*Powell, T. F.*, Adj't, 23d North Carolina.	May —, —, '64.	——. Surgeon W. B. Fox, 8th Michigan.
1913	*Price, J. W.*, Pt., I, 30th Georgia.	Sept. 1, 1, '64.	Right; flap. Surgeon J. Pogue, 66th Illinois.
1914	*White, J. K.*, Corp'l, B, 24th N. C.	April 20, 20, '64.	Right; semi-lunar flaps. Surg. C. H. Ladd, C. S. A.

In two of the nineteen hundred and fourteen cases the amputation of the thigh was followed by successful re-amputation at the hip;[2] in five, the opposite limb was amputated either in the leg or in the ankle joint;[3] and in nine, the amputation in the thigh was accompanied by operations in the upper extremities.[4] The seat of fracture was, in the lower third of femur, in four hundred and twenty-six; in the knee joint, in eleven hundred and thirty-three:

[1] Fisher (G. J.), *Report of Fifty-seven Cases of Amputations in the Hospitals near Sharpsburg, Md., after the Battle of Antietam, Sept.* 17, 1862, in *Am. Jour. Med. Sci.*, 1863, Vol. XLV, p. 47.

[2] Case of Private J. Fabry, K, 4th Artillery (Table XXXII, No. 267, p. 248; Case 330, p. 153; and Table XVIII, No. 2, p. 159, *ante*), and case of Private *R. A. Vick*, E, 43d North Carolina (Table XXXII, No. 890, p. 255; Case 334, p. 157; and Table XVIII, No. 6, p. 150).

[3] Sergeant P. Bradley, 16th Michigan (Table XXXII, No. 1071, p. 257), amputation of left thigh and right leg, fatal. Pt. C. L. Johnson, B, 1st Tennessee (Table XXXII, No. 1402, p. 261), amputation left thigh and right leg, fatal; Pt. L. O. Lamphere, G, 21st Connecticut (Table XXXII, No. 1445, p. 262), amputation left thigh and right leg, fatal; Pt. *J. R. Lewis*, H, 53d Georgia (Table XXXII, No. 1469, p. 262), amputation of left thigh and right leg, fatal; Lieut. A. Birmingham, A, 69th New York (Table XXXII, No. 1049, p. 257), amputation of right thigh and left leg at ankle joint, fatal.

[4] Private F. Rose, D, 57th N. Y. (Table XXXII, No. 729, p. 253, *ante*, and *Second Surg. Vol.*, Table LXVIII, No. 892, p. 711), amputation of thigh and arm, recovery; Capt. H. Kircher, E, 12th Mo. (Table XXXII, No. 471, p. 250, and *Second Surg. Vol.*, Table LXX, No. 481, p. 727), amputation of left thigh and right arm, recovery; Pt. J. S. Fay, F, 13th Mass. (Table XXXII, No. 273, p. 248, and *Second Surg. Vol.*, Table CXXXIII, No. 378, p. 972), amputation thigh and forearm, recovery; Corp'l C. Lawrence, E, 90th N. Y. (Table XXXII, No. 503, p. 251, *ante*, and *Second Surg. Vol.*, Table CXXXIII, No. 463, p. 973), amputation of thigh and forearm, recovery; Corp'l T. Costello, E, 93d Ind. (Table XXXII, No. 167, p. 247, *ante*, and *Second Surg. Vol.* Table CXXXIII, No. 679, p. 975), amputation of thigh and forearm, recovery; Corp'l A. Kretzler, D, 162d N. Y. (Table XXXII, No. 487, p. 250, *ante*, and *Second Surg. Vol.*, Table CXXXIII, No. 756, p. 976), amputation of thigh and forearm, recovery; Corp'l G. W. Hays, K, 2d Mich. (Table XXXII, No. 1336, p. 260, *ante*), amputation of left thigh and excision of right knee joint, fatal; Pt. N. W. Henderson, E, 123d Ohio (Table XXXII, No. 1338, p. 260, *ante*, and *Second Surg. Vol.*, Table CXXVII, No. 27, p. 952), amputation of thigh and excision of ulna, fatal; Pt. J. Van Vliet, H, 107th N. Y. (Table XXXII, No. 1833, p. 266, *ante*, and *Second Surg. Vol.*, Table CXXVII, No. 66, p. 952), amputation of thigh and excision of radius, fatal.

in the leg, in three hundred and fifty-three; and in the foot, in two instances. Pyæmia was noted in one hundred and twenty-eight, gangrene in one hundred and twelve, and tetanus in seven instances.

Primary Amputations in the Shaft of the Femur without Indication of the Seat of Incision.—Three hundred and forty-five primary amputations in the thigh were recorded in which the precise seat of the operation was not specified. The cases are well authenticated, but the histories are frequently deficient in detail. In twenty-one the issue as to fatality could not be ascertained. Thirty-nine were successful and two hundred and eighty-five fatal, a mortality of 87.9 per cent. The thirty-nine successful operations were performed on Confederate soldiers; the two hundred and eighty-five fatal operations were performed on two hundred and eighty-one patients, of whom two hundred and thirty-six were Union and forty-five were Confederate soldiers. The operations were on the right side in one hundred and five, on the left in one hundred and seven, and in one hundred and thirty-three instances the side was not indicated. Brief abstracts of the cases will be found in the following table:

TABLE XXXIII.

Summary of Three Hundred and Forty-five Cases of Primary Amputations in the Thigh for Shot Fracture, the Point of Ablation unspecified.

Recoveries, 1—39; Deaths, 40—324; Results unknown, 325—345.

In three hundred and forty-one of the cases enumerated in this table the seat of fracture was in the femur; in two, in the knee joint; and in two, in the leg. In four fatal instances both thighs were primarily amputated; and in one, primary amputation of the thigh was performed on the right, and intermediary amputation in the lower third on the left limb.[1] In three cases, an arm, and in one, a leg were simultaneously removed.[2]

INTERMEDIARY AMPUTATIONS IN THE SHAFT OF THE FEMUR FOR SHOT INJURY.—This category comprises thirteen hundred and twenty cases. Four hundred and seventy-nine proved successful and eight hundred and forty-one were fatal.

Intermediary Amputations in the Upper Third of the Femur.—There were one hundred and forty-seven intermediary amputations in the upper third of the femur, with fifty recoveries and ninety-seven deaths. The right limb was implicated in seventy-seven cases, the left in fifty-four, and in sixteen this point was not recorded. The modes of operation are reported as: circular, forty-six; flap, thirty-nine; not stated, sixty-two.

Successful Cases of Intermediary Amputations in the Upper Third of the Femur.—The fifty operations of this group were performed on forty Union and ten Confederate soldiers. Thirty-five of the thirty-eight pensioned Union soldiers were living in 1879. The injuries were caused by shell in five, by grapeshot in one, by solid shot in one, and by small missiles in forty-three instances. In the following case the patient, an employé of the Pension Office, was in excellent health in October, 1879:

FIG. 188.—Appearance of stump eleven years after amputation. [From a photograph.]

CASE 453.—Private Lorenzo E. Dickey, Co. A, 4th Maine, aged 21 years, received a gunshot wound of the right thigh, at Chantilly, September 1, 1862. He was taken to a field hospital in the vicinity of the battle ground, where the limb was amputated at the upper third, on the fourth day after the reception of the injury. On September 8th, the patient arrived at Washington and was admitted to Douglas Hospital. A hæmorrhage from the femoral artery, to the amount of twenty ounces, occurred on October 16th, and was controlled by pressure. After this the case progressed favorably and the wound healed about January 1, 1863. About two months later the patient was transferred to Lincoln Hospital, and subsequently he was sent to St. Elizabeth Hospital, whence he was discharged June 16, 1863, and pensioned. Mr. Dickey was subsequently appointed a clerk at the Pension Office. On January 14, 1873, he visited the Army Medical Museum, being in as good general health as he had been previous to the time of receiving the injury, and suffering no pain from the stump. He stated that his weight then was 192 pounds, while before he was wounded and lost his leg he only weighed 170 pounds. Owing to the shortness of the stump, being only three inches long from the hip joint, he is unable to wear an artificial limb and is obliged to use crutches in walking. A copy of the photograph, taken in 1873, is represented in the wood-cut (FIG. 188). His pension was paid September 4, 1879.

[1] Cases of Pt. S. Goodwell, G, 29th Illinois (No. 128, p. 269), fatal; Pt. *H. Kenner*, 4th Virginia (No. 169, p. 270), fatal; Pt. C. Myer, F, 30th Missouri (No. 212, p. 270), fatal; Pt. H. Tieman, C, 119th New York (No. 285, p. 271), fatal. In the case of Pt. W. F. Mills, E, 8th New York H. A. (No. 205, p. 270), primary amputation in the right thigh, and subsequently intermediary amputation in the left thigh was performed.

[2] An arm was simultaneously removed in the cases of Pt. S. Cramer, B, 142d Pennsylvania (No. 84, p. 269, and *Second Surg. Vol.*, TABLE LXXV, No. 39, p. 751); Lieut. *T. J. Thorn*, D, 16th North Carolina (No. 283, p. 271, and *Second Surg. Vol.*, TABLE LXXV, No. 153, p. 752); and Pt. J. Wilson, 21st New York Battery (No. 315, p. 271, and *Second Surg. Vol.*, TABLE LXXV, No. 167, p. 752). In the case of Serg't J. Foss, C, 59th New York (No. 116, p. 269), the opposite leg was amputated.

The femur was fractured in its upper third in four of the fifty examples of this group, necessitating amputation close to the trochanters:

CASE 454.—Captain John C. Hilton, Co. K, 145th Pennsylvania, aged 22 years, was wounded at Gettysburg, July 2, 1863, by a conoidal ball, which fractured the right femur in its upper third. He was carried to the field hospital of the 1st division of the Second Corps, where Surgeon C. S. Wood, 66th New York, reports: "The bone was extensively comminuted. I amputated the thigh about one inch below the trochanter major. The operation was not performed until eleven days after the receipt of the injury, yet the patient at this date, August 2d, is rapidly improving." The patient entered Camp Letterman hospital August 5th, where Acting Assistant Surgeon B. F. Butcher notes: "He is doing very well; the treatment consists of stimulants and nourishing diet, with water dressings to the stump. August 20th, still improving, all ligatures were removed, the stump healing rapidly. On the 25th, the stump had entirely healed, and on September 1st, he left the hospital on leave of absence." This officer was discharged December 19, 1863, entered the Veteran Reserve Corps February 5, 1864, was mustered out of service June 30, 1866, and pensioned. His pension was paid June 4, 1879.

CASE 455.—Private Alvin Hubbard, Battery M, 5th Artillery, aged 20 years, was wounded at Spottsylvania Court House, May 12, 1864, by a solid shot or a large fragment of shell, which struck both knees, fracturing the patella and opening the joint of the right knee, and inflicting a large flesh wound on the inner side of the left knee. He was taken to the field hospital of the Artillery Brigade, Sixth Corps, and on the 14th sent to Fredericksburg. On May 24th, he was admitted into the Third Division Hospital, Alexandria, from which Surgeon E. Bentley, U. S. V., reports: "The right leg and knee were badly swollen, painful and œdematous, and the soft parts ecchymosed; there was an unhealthy discharge from the wound; the left knee was black and swollen, but the joint was not seriously injured. His constitutional condition was much disturbed, pulse quick and frequent, appetite poor. On the 25th, it was decided to amputate, and, after placing the patient under the influence of chloroform, Surgeon Bentley removed the right thigh just below the trochanter by the circular operation; free incisions were made in the integuments of the left knee. He rallied well from the operation, and the after treatment consisted of stimulants, opiates, and nourishing diet. On October 7th, he was transferred to the First Division Hospital, Alexandria; on February 25, 1865, to the hospital at Fairfax Seminary; and finally discharged at the Judiciary Square Hospital, Washington, May 19, 1865." Examining Surgeon E. H. Wood, of Hersey, Michigan, September 5, 1877, reports: "The stump of the amputated limb is sound. The wound on left knee healed, leaving a large scar, and the patella so dislocated upward that this leg can be only semi-flexed." His pension was paid June 4, 1879.

In the next case the patient died, nearly nine years after the operation, of tubercular disease of the lungs complicated with necrosis of the stump of several years standing:

CASE 456.—Private J. Frederick, Co. D, 15th Massachusetts, aged 35 years, was wounded and captured at Bristoe Station, October 14, 1863. After remaining a prisoner for a month he was paroled and brought to Annapolis, where he entered the First Division Hospital on November 18th. Assistant Surgeon W. S. Ely, U. S. V., contributed the pathological specimen (FIG. 189), with the following description of the injury: "A fragment of a shell entered the left thigh in its middle third posteriorly, and passing directly forward, produced an extensive comminution of the femur and great destruction of muscular tissue. He laid upon the battle field without medical attendance until the afternoon of the following day, when he was conveyed by the enemy to Gordonsville, where he suffered amputation of the injured limb at the junction of the upper and middle third, by the circular method, on October 26th. When admitted here, this soldier gave evidence of having endured a full share of the exposure and neglect to which our captured men, as a general rule, were subjected. His system was found to be excessively reduced: his pulse rapid and feeble; anorexia existing, and an exhausting diarrhœa complained of. At the seat of the operation the parts gave evidence of unhealthy reparation, the wound was open, the skin retracted, and the sawn extremity of the femur protruding beyond the tissues to the extent of one and a half inches. It was thought advisable to leave to nature the removal of the protruding bone, and therefore no operative interference was determined upon. The patient's body was thoroughly cleansed, and an equable temperature maintained in his room, the stump washed twice with alcohol, and lint moistened with diluted alcohol kept applied. Generous diet was enjoined, and six ounces of spiritus fermenti was given daily. For the diarrhœa a prescription was ordered consisting of one grain of sulphate of morphia, ten grains of quinine, one and a half drachms of diluted sulphuric acid, and one ounce of water, to be given in doses of a teaspoonful three times a day. By December 1st, the patient was slowly improving, the diarrhœa being no longer troublesome, and his appetite good, though his pulse still continued rapid. The stump under the action of the alcohol applied locally, combined with the constitutional measures employed, now presented a granulating surface, and the granulations were slowly extending towards the extremity of the bone, one inch of which was still exposed. His treatment was yet continued with the exception of the prescription for the diarrhœa, for which a mixture of twenty grains of quinine, one and a half drachms of muriated tincture of iron, and ten drachms of simple syrup was substituted, to be given in teaspoonfuls one hour before meals. On January 6th, the applications of alcohol to the stump were discontinued; the patient still doing well and no marked change having occurred. January 29th, by seizing the protruding extremity of the femur between the fingers it became perceptible that a slight movement of rotation could be made. February 4th, necrosis going on certain but slow; considerable movement now attainable, causing great pain to the patient; muscles of affected limb apparently becoming hypertrophied; general health of patient continuing good. February 26th, protruding bone a little more mobile; discharge increasing in amount and becoming offensive. It was not yet deemed advisable to interfere with the natural process going on, a portion of the fragment not being sufficiently separated and liable to break off if extraction was attempted, thus retarding the subsequent reparative process. On April 1st, interference was deemed proper, the fragment appearing to be very free. Sensibility being too great to operate without the use of anæsthetics, chloroform was administered, the extremity

FIG. 189.—Tubular sequestrum of nearly 5 ins. removed six months after amputation. *Spec.* 2232.

seized with a large forceps by Surgeon B. A. Vanderkieft, U. S. V., and by a combined motion of traction and rotation the separated portion, measuring five inches in length, was removed entire. The patient recovered rapidly from the anæsthetic and felt great relief. He progressed finely and the stump closed rapidly, and the result of waiting upon nature in this case proved very satisfactory, though it would be interesting to know whether a second operation performed at the time of the patient's admission would have prevented necrosis to the depth at which it was found to exist." The patient was discharged from service May 24, 1864, and supplied with an artificial limb by B. F. Palmer, of Philadelphia, five months afterwards. He died March 13, 1872, Dr. J. Hyndman, of Boston, certifying that his death was caused by "tubercular disease of the lungs, complicated with necrosis of the bone of the amputated limb" of several years' standing, etc.

Fatal Cases of Intermediary Amputation in the Upper Third of the Thigh.—The ninety-seven operations of this category were performed on eighty-one Union and sixteen Confederate soldiers. A case, in which the amputation had been preceded by primary excision in the upper third of the femur, has been detailed on page 205, *ante* (CASE 418, Corporal J. W. Soule, D, 6th Michigan Cavalry); a second case will here be cited:

CASE 457.—Private J. Kelly, Co. F, 1st New York Cavalry, aged 21 years, was wounded near Hagerstown, July 7, 1863, and admitted to hospital at Frederick on the following day. Acting Assistant Surgeon J. H. Bartholf contributed the specimen (No. 3875, *Surgical Section*, A. M. M.), with the following history: "While acting as a scout the man had his left thigh fractured by a cavalry pistol conoidal shot, at a point a little above the junction of the middle and lower thirds. The ball, much battered, was removed from under the skin on the inner side of the limb, three inches above the edge of the condyle. When admitted into hospital, Smith's anterior splints were applied and continued till July 16th, when Buck's extension apparatus was substituted, with sand bags to the side of the limb. Much fœtid pus was found to be confined in the limb, which was let out by enlarging the opening. The patient having all the signs of pneumonia of the left lung, an oiled silk jacket was applied around the thorax. July 18th, patient more comfortable with the change of appliance to the limb; six ounces of milk punch given daily, and nourishing diet. 19th, rusty colored sputa continuing, with but little cough; double friction sound over heart; heart's action somewhat turbulent. 21st, pulse 120; brown, moist fur on tongue; feeling of great oppression in chest, but friction sound over heart nearly gone; some diarrhœa; suppuration from limb very free and somewhat offensive. Applied oakum dressings and gave pills of camphor and opium. 22d, pulse smaller; cough increasing; pain and tenderness to pressure of limb now extending up to groin and becoming more acute from pus burrowing up among the muscles; diarrhœa continuing at intervals. Increased the milk punch to one pint per day. 23d, patient very feeble and in a very critical state; thoracic symptoms diminishing. 27th, all chest symptoms gone; thigh in bad condition; pus burrowed among the muscles in front nearly to groin; has two troublesome bedsores. 29th, sleeps tolerably well now; vomited once after tea, but has no chills. 31st, pulse still 120; erysipelatous inflammation about the wound. The best of diet and half a pint of milk punch is given daily. August 5th, the patient's general condition, strength, and appetite has somewhat improved during the last few days. The diarrhœa continues, however, the bedsores are very troublesome, and the fractured bone is a good deal necrosed, and abscesses are extensive in the thigh. 6th, amputation was performed by Assistant Surgeon R. F. Weir, U. S. A., at 4 P. M., as low down as the wound would permit; method: Flaps of skin and circular of muscles. Two and a half inches of the upper fragment of the bone were removed, when, the medullary canal and periosteum being still found dead, one and a half inches more of the shaft were taken off, thus getting a line or two above the necrosis. Four fragments were found, all being more or less attached by periosteum or muscle, but all partially denuded of periosteum and necrosed. One large lower fragment embraced the greater part of the lower third of the femur and was considerably denuded and necrosing, showing scarcely any effort at repair. A sinus on the outer and front aspect of the thigh, found at the amputation to reach nearly up to Poupart's ligament, had a counter opening then made in its upper extremity. Reaction did not take place, in spite of all efforts, until 11 P. M., and not decidedly then, vomiting occurring at intervals and some delirium. Patient was placed on a water-bed at 11 P. M. 7th, pulse 150 and a mere thread; condition very precarious indeed. At 9 A. M., patient rallied somewhat, then fell asleep and slept the greater part of the day. Administered beef tea and milk punch alternately throughout the day. 8th, pulse 116 and much fuller; flaps sloughy and fœtid. Applied the strong nitric acid, and after that injected a mixture of hydrochloric acid, one ounce; laudanum, two ounces; and water, fourteen ounces, between the flaps and into the sinus, after which oakum dressing, wet with the same wash, was applied. All the sutures were removed but one, and extension was applied to flaps, to prevent retraction, by adhesive strips, string, pully, and weight. Patient has considerable diarrhœa, and takes camphor and opium pills; is also ordered ten grains of tartrate of iron and potassa three times a day. 9th, pulse 136; suppuration from stump healthy and not fœtid; diarrhœa ceased during night but recurred this morning. Patient has aphthæ on the tongue and lips; has some little relish for food. Opium is continued, and tincture of chloride of iron is substituted for the tartrate of iron and potassa. 10th, pulse 120; diarrhœa a little better; ordered Hope's mixture for it, also ten grains of chlorate of potassa four times a day for stomatitis. Stump not sloughy; good flaps. Patient has some little appetite and is ordered good food, with one pint of milk punch daily. 11th, stump in good condition; diarrhœa worse. Gave one grain of opium every two hours and continued other medicine. 12th, stomatitis and diarrhœa ceased. 13th, stomatitis and diarrhœa returned. Patient losing strength and wasting in flesh; pulse 126; pus from stump healthy. 14th, pulse 128; had nausea last evening and vomiting this morning; no chill; diarrhœa slight; granulations weak and pale. Discontinued the tincture of iron, and prescribed extract of nux vomica, four grains, and pulverized iron, twenty grains, to be made into sixteen pills, and administered one three times a day. 15th, pulse 130; some nausea; stomatitis very bad; diarrhœa troublesome; bedsores painful. Treatment continued and brandy mixture ordered. 17th, subsultus tendinum. 18th, patient died. *Sectio cadaveris* seventeen hours after death: Body much emaciated. On examining the stump found sinuses up the thigh in various directions, and just behind the trochanter major a circumscribed abscess containing about an ounce of pus; another similar one near the trochanter minor; hip joint intact; tissues of stump very unhealthy, and wound of stump pale and flabby and presenting scarcely any granulations. On opening the chest found the right lung healthy and

weighing twelve ounces; left lung, upper lobe healthy; lower lobe in a state of red hepitization through nearly its entire extent, and permeable to air here and there; weight one pound and two ounces. Pleura healthy. The heart was contracted and firm, clots in both sides of it, especially in the left; valves healthy; no evidence of endocarditis; recent pericarditis well marked; pericardium throughout adherent by new false membrane becoming organized, susceptible of being torn off by little force; weight of heart ten ounces. Liver moderately contracted, with cirrhosis and a little hobnailed; weight three pounds and two ounces."

TABLE XXXIV.

Summary of One Hundred and Forty-seven Cases of Intermediary Amputations in the Upper Third of the Femur for Shot Injury.

[Recoveries, 1—50; Deaths, 51—147.]

No.	NAME, MILITARY DESCRIPTION, AND AGE.	DATES.	OPERATIONS, OPERATORS, RESULT.
1	[1]*Anderson, S.*, Pt., B, 20th Alabama.	Sept. 19, 22, '63.	——; erysipelas; gangrene. Recovery.
2	Beckart, A., Pt., A, 74th New York, age 22.	Aug. 29, Sep.8.'62.	Left; circ. A. Surg. G. M. McGill, U. S. A. Dis'd May 22,'63.
3	*Bray, J. A.*, Pt., K, 3d Virginia.	June 27, 30, '62.	Left. Surg. A. Y. P. Garnett, P. A. C. S. Recovery.
4	*Briscoe, L. N.*, Pt., K, 7th South Carolina.	July 21, 29,'61.	Left. Surg. — Jennings, C. S. A. Recovery.
5	Cain, J., Corp'l, I, 104th New York.	July 1, 5, '63.	Left; circ. Surg. E. G. Chase, 104th N. Y. Disch'd Nov. 3, 1864. *Spec.* 3022.
6	Calder, J., Lieut., G, 2d Kentucky Cav., age 28.	Sept. 20, 27, '63.	Right. Surg. W. Varian, U. S. V. Disch'd March 1, 1864.
7	*Cunningham, E. H.*, Sgt, E, 9th Louisiana.	Aug. 9, 14, '62.	Right. Surg. — Davis, C. S. A. Recovery.
8	Dalton, T. W., Pt., G, 82d New York, age 18.	Dec. 13, 16, '62.	Left; ant. post. flap; gangrene. V. R. C. June 21, 1863.
9	Darlington, W. B., Maj., 18th Penn. Cav., age 35.	May 5, 9, '64.	Right; circ. Confed. surgeon. Disch'd October 30, 1864.
10	Dickey, L. E., Pt., A, 4th Maine, age 25.	Sept. 1, 5, '62.	Right; hæm. from femoral artery. Disch'd April 27, 1863.
11	Dunlap, J. H., Pt., F, 3d N. Y. Artillery.	De.14,'62, Ja. 11,'63.	Right; circ. Surg. C. A. Cowgill, U. S. V. Disch'd April 15, 1863.
12	[2]*Dwyer, L.*, Pt., F, 14th Louisiana.	June 30, J'y 8, '62.	Right; circ. Surg. F. Formento, jr, C. S. A. Recovery.
13	Eagan, L. W., Pt., —, 22d New York.	Aug. 30, Sep.3,'62.	Right. Ass't Surg. B. Howard, U. S. A.
14	Frederick, J., Pt., D, 15th Massachusetts, age 35.	Oct. 14, 26, '63.	Left; flap. Confed. surg. Five ins. nec. seq. removed. Disch'd May 24, 1864. *Spec.* 2232. Died March 13, 1872; tuberculosis.
15	Hamlin, W. H., Corp'l, L, 7th Missouri Cav.	Oct. 18, No.18,'61.	Left; flap. Surg. N. S. Hamlin, 7th Mo. Cav. Disch'd May 5,'62.
16	Hervey, R., Pt., C, 83d Pennsylvania.	July 1, —, '62.	Left. Surg. C. Page, U. S. A. Disch'd Oct. 6, 1863.
17	Hilton, J. C., Capt., K, 145th Penn., age 22.	July 2, 12, '63.	Right. Surg. C. S. Wood, 66th N. Y. Disch'd Dec. 19, 1863.
18	*Hobbs, L. H.*, Pt., H, 27th Georgia, age 33.	Aug. 27, Se. 17,'64.	Right; circ. Transferred Sept. 22, 1864.
19	Hubbard, A., Pt., Bat'ry M, 5th U. S. Art., age 20.	May 12, 25,'64.	Right; circ. Surg. E. Bentley, U. S. V. Disch'd May 19, 1865.
20	Hugot, J., Pt., H, 5th N. Jersey, age 30.	May 5, 8, '62.	Left; circ.; hyperostosis. Disch'd July 7, 1863. *Spec.* 1256.
21	Iffla, A. G., Pt., C, 83d New York.	Sept. 17, Oct.7, '62.	Right. Surg. W. T. Thurston, U. S. V. Disch'd Dec. 12, 1862.
22	James, T., Pt, E, 147th New York, age 37.	Feb. 6, 10, '65.	Left; flap. Disch'd Sept. 6, '65.
23	Jennings, T., Pt., —, 24th New York.	Aug. 30, Sep.5,'62.	Right. Ass't Surg. B. Howard, U. S. A.
24	Kane, J., Serg't, D, 2d Michigan, age 23.	May 6, 12,'64.	Left. Disch'd March 27, 1865.
25	Keenan, J., Pt., B, 36th Illinois, age 34.	Nov. 30, De. 5,'64.	Right (gang.); ant. post. flap. Dr. Rainey, Franklin, Tenn. Disch'd June 12, 1865.
26	King, E. S., Pt., E, 23d Colored Troops.	July 30, Au. 12,'64	Left; flap. Surg. E. Bentley, U. S. V. Disch'd June 8, 1865.
27	Kirn, P., Pt., A, 69th Indiana.	Aug. 30, Sep.4,'62.	Right; circ. Disch'd Nov. 23,'62.
28	Kniffens, C., Serg't, D, 20th New York S. M., age 29.	July 1, 7, '63.	Right; circ. Surg. R. Longhran, 20th N. Y. S. M. Nec. Disch'd August 9, 1864. *Spec.* 4300.
29	Kreger, J., Pt., C, 142d Pennsylvania.	Dec. 13, 21, '62.	Right. Disch'd April 22, 1864.
30	Linehan, T., Pt., D, 37th New York, age 19.	May 31, Je. 27,'62.	Right; flap. A. A. Surg. G. H. Dare. Hæm.; lig. fem. artery. Disch'd Sept. 26, 1862. Died July 15, 1876.
31	Manghermar, J. G., Pt., K, 87th Indiana.	Sept. 19, 24, '63.	Right; flap. Surg. H. J. Herrick, 17th Ohio. Disch'd May 7, '64.
32	Masterson, J., Pt., B, 106th Penn.	Sept. 17, 21, '62.	Right; circ. Disch'd Jan. 13,'63.
33	Miller, J. H., Pt., E, 33d Iowa.	April 30, M'y 3,'64.	Right; flap. Confed. surgeon. Discharged, 1865.
34	Neal, W. H., Pt., H, 9th Illinois, age 20.	May 27, 30, '63.	Right; circ. Disch'd Feb. 5, '64.
35	Nehemiah, C. S., Pt., K, 26th Indiana, age 32.	Dec. 7, 31, '62.	Right. Surg. B. O. Reynolds, 3d Wis. Cav. Disch'd June 9, '63.
36	Ochs, H. G., Pt., H, 54th Penn., age 26.	May 15, 23, '64.	Right; circ. Disch'd Jan. 31,'65.
37	O'Connor, J., Pt., G, 28th Pennsylvania.	Sept. 17, Oct. 9,'62.	Right; flap. Disch'd June 27,'63. Died April 13, 1867.
38	*Page, G. L.*, Corp'l, B, 18th Texas.	Sept. 19, 26, '63.	Right. Surg. Bakeman, C. S. A. Retired Feb. 10, 1865.
39	Perkins, G., Pt., G, 2d Kentucky.	Jan. 1, 5, '63.	Left; flap. A. Surg. W. T. Mendenhall, 57th Ind. Discharged March 30, 1863.
40	Peters, J., Pt., A, 69th N. York, age 28.	July 21, Aug. 12, 1861.	Right. Surg. — Walker, C. S. A. Disch'd Jan. 25, 1862. Died April 8, 1871.
41	Porter, C., Citizen of Russellville, Ky., age 17.	July 11, 21, '64.	Right (gang.; aneurism); lateral flaps. Dr. J. R. Bailey, of Russellville. Recovery.
42	*Roberts, T.*, Guerilla, age 31.	Feb. 10, Mar.4,'64.	Left; ant. post. flap. A. A. Surg. P. Gilroy. Prison June 26, '64.
43	Royston, W. H., Pt., C, 2d Iowa, age 24.	Feb. 15, Mar.6,'62.	Left; flap. Disch'd Nov. 8, '62.
44	Schmidt, H., Pt., G, 57th Illinois.	Oct. 4, 28, '62.	Right; flap. Surg. J. R. Zearing, 57th Illinois. (Amp. arm.) Disch'd Dec. 18, 1863.
45	Seiter, J., Serg't, I, 7th New York.	Sept. 17, 27, '62.	Right. Disch'd Dec. 15, 1862.
46	Spear, W. A., Pt., I, 112th New York, age 35.	Sept. 29, Oct. 2,'64.	Right; Confed. surgeon. Disch'd June 13, 1865.
47	Velzy, G., Corp'l, K, 94th New York, age 21.	July 1, 8, '63.	Left; circ. Surg. R. Loughran, 20th N. Y. S. M. Disch'd July 19, 1864.
48	*Vick, E. R.*, Pt., I, 30th North Carolina.	July 1, 17,'62.	——. Surg. — Sacherell, C.S.A. Recovery.
49	Whitacre, J. R., Pt., E, 69th Indiana.	Aug. 30, Sep.6,'62.	Left; circ. A. Surg. D. W. Voyles, 66th Ind. Disch'd Nov. 22, '62.
50	Woodhouse, J., Pt., I, 20th Wisconsin, age 28.	Dec. 7, 11, '62.	Right; circ. Surg. P. Harvey, 19th Iowa. Bone remo'd. Recovery.
51	Acker, D., Pt., D, 148th Pennsylvania.	May 3, 18, '63.	Right. Died June 3, 1863.
52	Allen, H. H., Pt., F, 100th Penn., age 35.	May 12, 28, '64.	Right; circ. Surg. A. F. Sheldon, U.S.V. Died June 4,'64; exh'n.
53	*Allen, L. M.*, Pt., E, 10th Arkansas.	April 6, M'y 6,'62.	—— (erysipelas; hæm.) Died May 6, 1862.
54	Anderson, W. G., Pt, G, 114th Penn., age 16.	Dec. 13, 1862, Ja. 11,'63.	Right; flap. Jan. 13, 15, 17, hæm.; lig. mus. branch. Died Jan. 17, 1863; exhaustion.
55	Balcom, M. S., Pt., B, 12th Conn.	May 17, Je. —,'64.	Right (pyæmia; diarrhœa); circ. A. A. Surg. W. S. Ward. Died June 23, 1864; shock.

				147	Worchester, S. W., Pt., B, 9th N. Y. H. Art'y.	Sept. 19, 23, '64.	Left; flap. Surg. W. A. Barry, 98th Penn. Died; exhaustion.

In one hundred and thirteen of the above cases the femur had been fractured—in eighteen, in the upper; in fifty, in the middle; in fifteen, in the lower third; and in thirty, without indication of the precise location. In twenty-nine instances the seat of fracture was in the knee joint, and in five in the leg. In one case, primary amputation in the upper third of right arm, in three instances excision in the thigh or bones of the leg, and in one, amputation in the upper third of the same leg had preceded the amputation in the thigh.[1]

Intermediary Amputations in the Middle Third of the Thigh.—The four hundred and seventy-one intermediary amputations in the middle third of the thigh furnished two hundred and sixty-six deaths, a mortality rate of 56.4, or nearly 10 per cent. less than the intermediary upper third amputations. Seventy-two of the four hundred and seventy-one operations were performed on Confederate soldiers. The right limb was removed in two hundred and nine, and the left in two hundred and thirty-five instances, and in twenty-seven the side was not indicated. The circular and the flap methods were each employed in one hundred and sixty-three cases; in one hundred and forty-five the mode of operation was not stated.

Successful Cases of Intermediary Amputations in the Middle Third.—One hundred and sixty-seven of the two hundred and five operations of this group were performed on Union soldiers. All but seven were living in October, 1879. Two had undergone antecedent operations; one an excision at the knee joint, and one an amputation in the upper third of the leg.[2] Sequestra were removed in twelve, and fragments or protrusions of bone in thirty-one instances:

Case 458.—Sergeant H. Clark, Co. E, 125th New York, aged 22 years, was wounded at the Wilderness, May 6, 1864, and entered the Third Division Hospital, Alexandria, eight days afterwards. Surgeon E. Bentley, U. S. V., reported: "The patient was admitted with a shot injury of the left knee joint, caused by a conical ball. His physical state was good, but the condition of the wounded limb was such as to give no hope of recovery without resorting to amputation. The operation was performed by antero-posterior flaps, at the junction of the middle and lower thirds, on May 17th, chloroform being used as the anæsthetic. The patient did not rally well, and fears were entertained of his immediate death. He had chills at intervals for a week or ten days. By June 10th, the stump was doing well and partly closed by first intention, though there was profuse suppuration. The treatment consisted of stimulants, beef tea, iron, and quinine, and cold-water dressings. With the exception of the excessive suppuration the patient did well until June 20th, when he had a severe chill, and stimulants were ordered to

Becht, B, 7th Maryland (Table XXXIV, No. 57, p. 275, and Table XXIII, No. 3, p. 206, *ante*), primary excision in middle third of femur and amputation of thigh, fatal; Corp'l C. Jackson, 2d Michigan (Table XXXIV, No. 91, p. 276), excision of upper part of fibula and subsequent amputation of thigh, fatal; Pt. G. Tompkins, G, 1st New York Battery (Table XXXIV, No. 137, p. 277), amputation of upper third of leg followed by amputation in thigh, fatal.

[2] Private W. M. Constable, H, 1st Cavalry, wounded March 31, 1865; primary excision of knee joint March 31, 1865, amputation of thigh April 5, 1865 (Table XXXV, No. 43, p. 280); Pt. A. J. Cheever, H, 16th Massachusetts, wounded July 2, 1863, amputation of leg July 4th, and amputation of thigh July 18, 1863 (Table XXXV, No. 35, p. 280).

be used freely, and quinine was given in large doses. The secretion having become watery and offensive, the dressings were changed frequently. No repetition of the chill occurred, and by June 25th the patient's countenance had changed very much for the better, being now clear instead of the yellow hue. The treatment was continued, and the patient steadily improved, his appetite being good and his bowels regular. On July 1st, the stump had closed with the exception of one opening, which was still discharging a large quantity of pus, healthy in color and odor, however. On July 7th, the patient complained of pain just below the great trochanter, caused by tumefaction and great heat of the skin, for which tincture of iodine was applied, followed by a tight bandage, and morphia was administered. On July 10th, an abscess was opened in the region of the great trochanter and followed by a thin watery discharge. A tent was then introduced, and the whole stump being much swollen, it was painted with tincture of iodine, and a bandage was applied tightly. On July 15th, another abscess was forming on the posterior aspect; the stump, though much reduced in size, was still discharging quite freely. On July 20th, the patient was suffering from a severe diarrhœa, and his diet was restricted, and lead and opium prescribed. By July 30th, the diarrhœa was checked; the abscess on the posterior aspect of the thigh, having formed a track and opened at the end of the stump, evacuated half a pint of healthy pus. The stump still continuing to discharge large amounts of pus, the bandage was kept tightly applied. Diluted creasote was also used locally, and iron and quinine was continued internally. On August 7th, a new abscess was opened just below the great trochanter. On August 13th, the stump still suppurating freely, an injection of solution of chloride of zinc was commenced, the bandage being continued, and the patient freely stimulated by the use of whiskey. After this date several abscesses formed on different parts of the thigh, which were opened and discharged large quantities of pus. By proper bandaging the limb was finally reduced to near its natural size, but one opening remaining at the end of the stump and discharging a limited quantity of pus. By the use of stimulants and nourishing diet the patient's general health improved so as to enable him to be transferred to hospital at Albany, near his home, on November 11th." The description of two subsequent operations was contributed by Assistant Surgeon J. H. Armsby, U. S. V., in charge of Ira Harris Hospital: "At the time of the patient's admission his constitutional condition was bad, being pale, weak, and emaciated. The stump was swollen and inflamed, and there were several small fistulous ulcers. On February 6, 1865, a sequestrum (FIG. 190) was removed through an incision about five inches in length by Acting Assistant Surgeon H. Pearce. After this operation the stump began to heal, and continued to do well up to September 4, 1865, when the patient was discharged from service. On December 9th, following, he applied for admission into the Albany City Hospital. The stump was then healed with the exception of a small fistulous ulcer, which was discharging moderately. There was but little swelling and pain, but, on examination with the probe, naked and carious bone could be discovered. The patient having been placed under the influence of chloroform, two elliptical incisions were made on the extremity of the stump, including the ulcer, and the tissues were removed down to the bone, thus leaving lateral flaps. A chain saw was then introduced and the bone cut through an inch and a half higher up, after which the flaps were brought together and secured by sutures. Cold-water dressings were applied after the operation." A cast of the stump (FIG. 191) was also contributed to the Museum by Dr. Armsby, and constitutes *Specimen* 294 of the Surgical Section. Fourteen months after the last operation the patient was supplied with an artificial limb by E. D. Hudson, of New York City. Examiner A. P. Cook reported, May 14, 1873: "He is unable to wear an artificial limb. The femur is about three inches shorter than the fleshy stump. The stump is atrophied, the muscles are soft, and there is a deep cicatrization at the end, which is very tender." The pensioner was paid June 4, 1879.

FIG. 190.—Sequestrum, 4½ ins. long, remov'd nine months after amputation. *Spec.* 666.

FIG. 191.—Cast of stump of left thigh, nineteen months after amputation. *Spec.* 294.

FIG. 192.—Amputation of left thigh at middle third. [From a photograph.]

CASE 459.—Lieutenant-Colonel George R. Maxwell, 1st Michigan Cavalry, aged 22 years, was wounded at Five Forks, Virginia, April 1, 1865. He was taken to the field hospital of the Cavalry Corps and remained there until April 15th, when he was sent to Washington on the hospital steamer Connecticut, and admitted to the Armory Square Hospital on the 16th. Acting Assistant Surgeon C. A. Leale,[1] in a special report of the case, furnishes the following particulars: "The left knee joint was opened by a conoidal ball, which had entered opposite the head of the fibula and was extracted at point of entrance. He was very anæmic and in a generally unfavorable condition; extensive suppuration had taken place, the leg had become infiltrated with serum, the knee joint was filled with pus, and the muscles of the thigh had been separated by extensive abscesses extending as high as the apex of Scarpa's triangle. April 17th, no change in his condition; he was placed under the influence of ether, and the thigh amputated by the circular operation, at the middle third, by Surgeon D. W. Bliss, U. S. V.; the stump was dressed with water, and the patient placed in bed. April 18th, although twelve ligatures had been applied, hæmorrhage continued to take place (he being apparently of a hæmorrhagic diathesis), and altogether about eight ounces of blood was lost. Applied liquor ferri persulphas by a camel's hair brush to the whole of the surface of the wound, which had been left open and exposed to the air for about fifteen minutes; this, with the styptic, entirely checked all oozing. April 20th, the granulations had become healthy; about two drachms of pus discharged daily. On the 30th the stump had nearly closed. June 23d, a piece of necrosed femur of a conical shape, and about four inches in length, was removed. August 8th, he was mustered out of service; his stump (FIG. 192) was solid and in good condition." The pensioner was paid June 4, 1879.

UNIVERSITY

CASE 460.—Private O. Vezina, Co. B, 9th New Hampshire, aged 24 years, was wounded at Tolopotomy Creek, May 31, 1864, and admitted to the field hospital of the 2d division, Ninth Corps, where Surgeon J. Harris, 7th Rhode Island, noted: "Shot wound of right leg by minié ball." Four days after the reception of the injury the man was transferred to Douglas Hospital, Washington, where the limb was amputated. Assistant Surgeon W. Thomson, U. S. A., who performed the operation, described the case as follows: "The missile entered over the anterior surface of the tibia at about the junction of the lower thirds, passed obliquely upward and inward, fracturing the bone in several pieces and lodging beneath the integuments, whence it was extracted on the field. The fibula was not injured. On admission, the leg was erysipelatous and abscesses were burrowing above and below, one of which was opened below the internal malleolus. Poultices were applied, and several sloughs of the integuments came away, leaving the muscles and tendons exposed. The patient suffered constitutional irritation from continual pain and was anxious for amputation, which was performed on June 11th, by the antero-posterior flap method, at the lower part of the middle third. The stump was dressed with equal parts of tincture of opium and tincture of camphor, and poultices were applied until June 18th, when the sloughs had entirely separated. After this, cold-water dressings were used and the stump progressed finely. By September 1st, it had been healed for some time, with the exception of a fistulous opening leading to necrosed bone. On October 13th, the patient having for some days suffered from great pain and consequent inability to rest, a sequestrum, six inches long and of a nearly entire circumference, was, with great difficulty, removed by Acting Assistant Surgeon H. Gibbons. A large formation of new bone was discovered around the cavity thus left in the stump. After the operation the pain ceased, and the patient again became cheerful and his appetite good. On December 25th, the opening had almost entirely closed." The upper portion of the tibia of the amputated limb, showing eccentric splintering by the missile, and necrosis adjacent to the seat of the fracture, was contributed by the operator, and is represented in the wood-cut (FIG. 193).

FIG. 193.—Upper portion of right tibia with eccentric splintering. *Spec.* 3558.

FIG. 194.—Tubular sequestrum, 6 ins. long, removed from right femur four months after amputation. *Spec.* 3599.

The sequestrum, shown opposite (FIG. 194), was contributed by Assistant Surgeon W. F. Norris, U. S. A. The patient was discharged from service June 14, 1865, and furnished with an artificial limb one month afterwards by B. F. Palmer, of Philadelphia. The pensioner was paid June 4, 1878.

In the following instance the officer remained in active service until 1870, when he was retired. He died in 1879:

CASE 461.—Brigadier-General T. W. Sherman, U. S. V., Colonel 3d U. S. Artillery, was wounded, during the assault on Port Hudson, May 27, 1863, by a conoidal musket ball passing through his right leg and causing a fracture of the tibia and fibula at the upper third. When conveyed to New Orleans, three or four days after the injury, the wound, which was extensive and greatly lacerated, was found to have been very tightly sewed up with one continuous suture, the cutting out of which gave exit to a large discharge of decomposing coagula, pus, and bone splinters. His constitutional symptoms had assumed a most aggravated character, and the patient remained in a very discouraging condition for nearly two weeks, when amputation through the middle third of the thigh, though only offering the slightest hope of success, was performed by Professor Warren Stone with favorable result. The injured tibia and fibula (*Spec.* 3504), many of the missing fragments of which were discharged from day to day before the amputation, were contributed to the Army Medical Museum by Professor F. Bacon, of New Haven, late Surgeon U. S. V. General Sherman was mustered out of the volunteer service April 30, 1866, and retired from active service December 31, 1870. He died at his home in Newport, R. I., March 16, 1879. (See *Circular* No. 6, War Department, S. G. O., 1865, p. 38.)

Fifteen of the patients survived ulterior operations—one a re-amputation at the hip joint,[1] ten, re-amputation of the thigh, one an amputation of the opposite arm and leg in consequence of an accident, and three, ligations of the femoral artery. Consecutive bleeding was observed in nine, pyæmia in two, and gangrene in fourteen of the cases of this group.

Fatal Cases of Intermediary Amputation in the Middle Third of the Thigh.—Two hundred and sixty-six cases belong to this group. Thirty-four of the operations were practised on Confederate, and two hundred and thirty-two on Union soldiers. Pyæmia was noted in forty-two, gangrene in thirty-three, tetanus in four, erysipelas in four, and hæmorrhage in sixty-nine instances. The Museum possesses specimens in eighty-nine of the two hundred and sixty-six cases:

CASE 462.—Corporal Clark Chase, Co. B, 120th New York, aged 23 years, was wounded at Cold Harbor, Virginia, May 31, 1864. Surgeon O. Evarts, 20th Indiana, reported the admission of the patient into the hospital of the 3d division, Second Corps, with a "shot wound of the left thigh, flesh; simple dressings." He was transferred to Washington, and admitted into Douglas Hospital on June 4th. Assistant Surgeon William Thomson, U. S. A., reported: "Shot fracture of right femur, lower part of middle third. The patient's condition was apparently good, his pulse full and strong. The bone was much comminuted. There was no inflammatory action. June 5th, Assistant Surgeon W. Thomson administered ether, and amputated the left thigh in the upper part of the middle third by the circular method. 8th, pyæmia developed, ushered in by a chill. 10th, chill; conjunc-

[1] Sergeant E. D. Ulmer, G, 15th New Jersey. (See CASE 333, p. 156, and TABLE XVIII, No. 5, p. 159, *ante*, and TABLE XXXV, No. 183, p. 282.)

tiva slightly yellow. 11th, hæmorrhage, to the extent of four ounces, from a muscular branch, which ceased spontaneously and did not recur. The discharge from the stump was very dirty and offensive, and breath sweetish. He died June 12, 1864. The autopsy revealed pyæmic patches in the lungs, phlebitis of femoral veins, and osteomyelitis of the femur." Dr. Thomson contributed the pathological preparation of the femoral artery to the Army Medical Museum, numbered 2509, and the lower two-thirds of the femur, numbered 3548, of the Surgical Section. He also forwarded the upper extremity of the femur (*Spec.* 6715, *Surg. Sect.*), removed *post-mortem*. A longitudinal section of the specimen, showing osteomyelitis, was drawn by Hospital Steward E. Stauch, and is copied in the chromo-lithograph (PLATE XXVI) opposite p. 278.

CASE 463.—Brigadier-General E. Kirby, U. S. V., First Lieutenant, U. S. Artillery, was wounded at Chancellorsville, May 3, 1863. He was admitted to the Artillery Brigade Hospital, Second Corps, whence Surgeon J. H. Merrill, 1st Rhode Island Artillery, reported: "Wound in lower third of left thigh by two bullets from a spherical case shot. Patient sent immediately to Washington." Surgeon B. Norris, U. S. A., under whose care the patient came to Washington, reported the following description and result of the injury: "Two round balls entered the thigh about two inches above the condyles, producing a comminuted fracture of the lower third of the femur. The case came under my treatment on May 5th, and amputation at the middle third by the circular method was performed on May 10th. The tourniquet was used, and chloroform employed as the anæsthetic. One ball was found embedded in the medullary canal of the femur, and the other in the vastus externus muscle. The operation was followed by increase of fever, which rapidly assumed the typhoid type. This brave young officer survived the operation eighteen days, and died of pyæmia May 28, 1863." The amputated portion of the femur was contributed to the Museum by the operator (*Cat. Surg. Sect.*, 1866, p. 290, *Spec.* 1076), and is represented in PLATE XLII, opposite.

TABLE XXXV.

Summary of Four Hundred and Seventy-one Cases of Intermediary Amputation in the Middle Third of the Femur for Shot Injury.

[Cases of recovery, 1—205; fatal cases, 206—471.]

No.	NAME, MILITARY DESCRIPTION, AND AGE.	DATES.	OPERATIONS, OPERATORS, RESULT.
1	Albert, J., Pt., D, 46th Penn., age 26.	Aug. 9, 14, '62.	Left. Surg. D. O. Perry, 10th Me. Necrosed. Disc'd Jan. 4, '64.
2	Alexander, J. D., Pt., A, 8th Maryland, age 20.	May 8, 12, '64.	Right; circ. Confed. surgeon. Disch'd June 20, 1865.
3	Allhouse, L., Pt., H, 63d Penn., age 20.	May 5, 27, '64.	Left; circ. A. A. Surg. M. F. Price. Seq. removed. Disch'd May 24, 1865. *Spec.* 2908.
4	Baker, G., Teamster.	Aug. —, —, '64.	Right; flap. Recovery.
5	Baker, J. T., Pt., B, 72d New York.	July 1, 5, '62.	Left. Surg. — Russell, C. S. A. Disch'd Aug. 22, 1865.
6	[1] *Barker, C. R.*, Pt., D, 7th Louisiana, age 23.	July 21, Aug. 9, 1861.	Right. Surg. — Ford, C. S. A. Necro.; dead bone, seven and a half ins. in length, extracted. Retired Jan. 5, 1865.
7	Barleon, G., Pt., C, 33d Ohio.	Jan. 3, 10, '63.	Left; flap. Disch'd April 27, '63.
8	Bartmess, G. J., Serg't, G, 36th Ohio.	Sept. 14, 17, '62.	Left; flap. Disch'd Jan. 5, 1863. Died Aug. 9, 1866; consumpt'n.
9	Bell, C. E., Serg't, C, 74th New York.	Aug. 27, Sept. 4, 1862.	Right; doub. flap. A. A. Surg. R. Reyburn. Six and a half ins. bone removed. Disch'd Jan. 23, 1863. *Spec.* 323.
10	Bennett, D., Pt., K, 1st W. Virginia, age 19.	Mar. 23, 27, '62.	Left; flap. Disch'd June 18, '62.
11	*Blazier, T. F.*, Pt., C, 1st Texas.	July 7, 15, '63.	Left. Recovery.
12	Blodgett, E. F., Pt., D, 4th Vermont, age 34.	May 5, 12, '64.	Right; flap. Disch'd August 22, 1864.
13	*Bodge, G. E.*, Pt., A, 5th Louisiana, age 25.	Sept. 19, Oct. 10, 1864.	Right; ant. post. flap. A. Surg. — Dorsey, 1st Md. Cav. C. S. A. Exchanged Feb. 16, 1865.
14	Boscroe, S., Pt., M, 4th Cavalry, age 21.	Feb. 22, 25, '64.	Right; circ. Confed. surgeon. Disch'd July 15, 1865.
15	Boss, E. P., Pt., K, 44th New York.	June 27, 30, '62.	Right. Disch'd Feb. 28, 1863.
16	Boucher, G., Pt., A, 76th New York.	July 1, 6, '63.	Right; circ. Surg. J. M. Farley, 84th N. Y. Disch'd Feb. 23, '64.
17	Bowen, J. H., Corp'l, C, 19th Indiana, age 23.	July 1, 18, '63.	Left (gang.); circ. Disch'd Dec. 19, 1863.
18	Boyle, M., Pt., F, 5th Ohio.	Aug. 9, 13, '62.	Left; flap. Disch'd Nov. 21, '62.
19	Brassell, W., Pt., M, 72d Penn., age 18.	Sept. 17, Oct 7, '62.	Left; lat. flap. A. A. Surg. J. H. Bartholf. Disch'd Dec. 29, '62. *Spec.* 771. Died Jan. 20, 1865; consumption.
20	Brown, J., Pt., H, 100th New York, age 21.	July 27, Au. 1, '64.	Right; circ. A. A. Surg. W. L. Welles. M. O. Feb. 9, 1865.
21	Bruce, J., Pt., B, 49th Penn., age 21.	May 10, 14, '64.	Right; circ. Confed. surgeon. Seq. rem'd. Prison (sentence G. C. M.) July 3, 1865.
22	*Buffington, J. D.*, Pt., A, Huger's Battery.	Sept. 17, 21, '62.	Right. Surg. — Gray, C. S. A. Furloughed.
23	Buffum, T. J., Corp'l, K, 100th New York.	July 18, 23, '63.	Right (mortificat'n); ant. post. flap. Disch'd Feb. 14, '64. *Spec.* 37.
24	*Burgess, D. M.*, Pt., Massier's Battery.	Nov. 3, 7, '63.	Right. Surg. — Browne, C. S. A. Recovery.
25	Campbell, W., Pt., C, 69th Penn.	Sept. 17, 21, '62.	Right; circ. Nec. bone excised. Disch'd July 29, '63. *Spec.* 3822.
26	*Campbell, W. P.*, Capt., D, 1st Arkansas.	De. 31, '62, Ja. 27, '63.	Right. Surg. J. Avents, C. S. A. Furloughed Oct. 1, 1863.
27	Campbell, W. B., Pt., C, 1st Me. H. Art., age 20.	May 9, Je. 1, '64.	Left; circ. Surg. D. W. Bliss, U. S. V. Disch'd Feb. 16, 1865.
28	Carey, J. G., Pt., D, 106th Pennsylvania.	May 14, 26, '64.	Right; circ. A. A. Surg. J. H. Thompson. Disch'd May 27, '65.
29	*Carey, W.*, Pt., B, 13th Arkansas.	April 7, 24, '62.	Right. Surg. C. H. Mastin, C. S. A. Recovery.
30	Carl, M., Pt., G, 107th Pennsylvania.	Sept. 17, —, '62.	Left; flap. Disch'd Feb. 17, '63.
31	Case, J. E., Pt., E, 16th Conn., age 22.	Sept. 17, Oc.—, '62.	Left; circ. Dr. P. W. Ellsworth, Hartford, Conn. Seq. remov'd. Disch'd Oct. 16, '63. *Spec.* 2859.
32	Castor, T., Pt., I, 5th Mich., age 26.	May 6, 11, '64.	Left; circular. Confed. surgeon. Disch'd Jan. 27, 1865.
33	Champens, W., Corp'l, C, 76th Penn., age 20.	July 11, 15, '63.	Left; flap. Confederate surgeon. Disch'd Aug. 24, 1864.
34	Chase, P. E., Pt., C, 7th Col'd Troops, age 25.	Aug. 14, 19, '64.	Right; circ. A. A. Surg. H. B. White. Fragments removed. Disch'd May 26, 1865.
35	Cheever, A. J., Pt., H, 16th Mass., age 35.	July 2, 18, '63.	Left (July 14, amp. leg). Disch'd January 27, 1864.
36	Christ, A. L., Corp'l, A, 5th Penn., age 21.	Jan. 30, Fe. 4, '64.	Right; circ. Surg. E. Bentley, U. S. V. Gangrene. Mustered out Dec. 23, 1864.
37	Clark, F., Corp'l, F, 4th Michigan, age 21.	July 2, 16, '63.	Left; flap. Surgs. Ramsour and Patterson, C. S. A. Carious bone rem'd. Disch'd June 14, 1864.
38	Clark, H., Serg't, E, 125th New York, age 22.	May 6, 17, '64.	Left; ant. post. flap. Surg. E. Bentley, U. S. V. Seq. four and a half ins. long rem'd. Disch'd Sept. 4, '65. *Specs.* 294, 602, 666.
39	Clark, M. D., Pt., D, 6th Ohio Cav., age 18.	Mar. 31, Ap. 5, '65.	Left; circ. Surg. D. W. Bliss, U. S. V. Disch'd July 18, 1865. *Spec.* 4058.
40	Clune, J., Pt., F, 14th Infantry.	Aug. 30, Se. 5, '62.	Right (hæm.); flap. Disch'd Jan. 2, 1863.
41	Collins, M., Pt., K, 13th Kansas, age 26.	Dec. 7, 10, '62.	Left; flap. Surg. A. J. Ritchie, 2d Kansas. Dec. 25, hæm.; lig. fem. art. Disch'd May 13, 1864.
42	Conners, W. B., Pt., C, 28th Illinois.	Oct. 5, 19, '62.	Right; circ. Surg. W. F. West, 28th Ill. Disch'd April 4, 1863.
43	Constable, W. M., Pt., H, 1st Cavalry, age 26.	Mar. 31, Ap. 5, '65.	Right (Mar. 31, exc. knee j't); circ. A. A. Surg. F. H. Colton. Seq. rem'd. Disch'd Nov. 18, 1865.
44	Cook, J. M., Lieut., E, 119th Penn., age 30.	May 3, 11, '63.	Left. A. A. Surg. H. W. Ducachet. Disch'd Aug. 19, 1863. Died July 28, 1865; sunstroke. *Spec.* 1119.
45	Cooper, A., Corp'l, F, 101st New York.	Aug. 30, Se. 8, '62.	Left; flap. Disch'd Dec. 11, '62.

The seat of fracture in the cases enumerated in the foregoing table was in the middle third of the femur in seventeen; in the lower third, in ninety-four; in the femur, without specification of third, in sixty-six; in the knee joint, in two hundred and thirty-four; in the leg, in fifty-six; and in the ankle joint or foot in four instances.

[1] Coues (E.), *Cases of Amputations and Resections, from Gunshot Wounds, performed by Assistant Surg. C. A. McCall, U. S. A.*, in *Medical and Surg. Reporter*, 1862–3, Vol. IX, p. 195.

Intermediary Amputations in the Lower Third of the Thigh.—There were six hundred and seventy-six of these operations. Two hundred and seventeen were successful and four hundred and fifty-nine terminated in death—a mortality of 67.9 per cent.,—exceeding the fatality of the intermediary amputations in the upper third by 1.9 per cent. and the same operations in the middle third by 11.5 per cent.

Successful Cases of Intermediary Amputations in the Lower Third of the Thigh.—Of the series of six hundred and seventy-six intermediary amputations in the lower third two hundred and seventeen had favorable results, comprising thirty-one Confederate and one hundred and eighty-six Union soldiers. Of the latter, one hundred and eighty-four were pensioned and one retired, and eight have died since the close of the war in 1865. Of fifty-three of these cases pathological specimens are preserved in the Army Medical Museum.

CASE 464.—Private W. Vannatta, Co. D, 4th Pennsylvania Cavalry, aged 24 years, was wounded at Upperville, June 21, 1863, and entered Stanton Hospital, Washington, three days afterwards. Surgeon J. A. Lidell, U. S. V., reported: "The patient, a man of sound constitution, had received a wound of the right knee by a carbine ball. The missile entered the limb on its anterior inner face a short distance below the joint, passed backward and upward, and escaped through the popliteal space, apparently without opening the joint. From the course and direction of the wound the upper part of the tibia was supposed to be injured. At the time of admission the patient's condition was good, there being no pain, heat, or swelling about the injured knee. He was directed to refrain from using it by remaining quietly in bed, to have ice applied to the wound constantly so as to lessen the danger of inflammatory action, and to be supported by nutritious diet. Under this treatment his case progressed without an untoward symptom until July 5th. At inspection, on this day, I especially noticed his condition as very promising, the anterior orifice of the wound being nearly healed. But, about the middle of the following night, he was seized with great pain and distress in the injured knee, and full doses of morphia were administered without producing much relief. On the following morning the knee was found to be greatly swollen, hot, and exceedingly tender, the patient complaining of intense gnawing pain in it, and crying out from agony occasioned by it. Although his pupils were markedly contracted from the large quantities of anodynes taken, his countenance was expressive of great distress; pulse frequent, quick, and irritable; skin hot and dry; he was also thirsty, had a coated tongue, and had had a slight chill. Free abstraction of blood from the neighborhood of the knee by cups was ordered, also ten grains of calomel, and anodynes as required. On July 7th, the patient's condition had not materially changed. Seeing that the arthritis was secondary to the wound, and believing that it was associated with fracture and comminution of the upper end of the tibia, amputation appeared to be the proper remedy. The operation was accordingly performed by Assistant Surgeon P. C. Davis, U. S. A., in the lower third of the thigh, by the circular method, about midday—thirty-six hours after the attack. Anæsthesia was produced by sulphuric ether. The patient bore the operation well. On examining the amputated limb the inner part of the head of the tibia was found to be extensively injured by the bullet, a deep groove having been made in the bone, associated with much comminution, and some of the broken fragments connected directly with the joint. The cavity of the knee joint was found to contain about four ounces of dirty-brown colored viscid liquid, in which yellowish shining globules (synovia), looking like oil, floated. The lining membrane of the joint was stained with a dull red hue throughout its whole extent and had entirely lost its polished and shining appearance. The internal semilunar cartilage completely covered the opening in the head of the tibia. On July 10th, the patient was progressing pretty well." On October 2d, he was transferred to Turner's Lane Hospital, Philadelphia, where a second operation was performed by Acting Assistant Surgeon C. B. King, who described it as follows: "When admitted, the femur was protruding about half an inch, and appeared to be dead as far up as could be felt with the probe, a ring of new bone being thrown around it. The discharge was very profuse. On October 5th, the patient having been placed under the influence of ether, an oval incision was made around the end of the bone and through the cicatrix and some unhealthy granulations, when, after dissecting the muscles for a short distance, the vitality of the new bone was found to be small, and lateral incisions were made and the flaps dissected up for about four inches, where the new bone seemed to be more healthy, and was sawn off. About four inches of the remaining dead bone, which I judged as reaching up as far as the great trochanter, was extracted with the forceps. The femoral artery was avoided by making the internal lateral incision below the vessel, and the patient lost but little blood. Three or four small arteries were ligated, and the wound was closed with iron wire and adhesive straps. The patient, being very weak from suppuration and the shock of the operation, was rallied with difficulty. Cold-water dressings were applied and stimulants administered. On the following day the patient was still very weak, had a slight fever and coated tongue, and the stump was very much inflamed and swollen. The sutures were removed and the straps loosened, and milk punch, beef tea, and generous diet were ordered. On October 12th, the inflammation was somewhat reduced, the discharge free but very offensive, and the patient was gaining strength slowly and his appetite improving. The ligatures were now removed. On October 18th, the bands were removed, union having taken place in the stump. On November 4th, the wound had closed with an abundance of flap, and the patient was going about on crutches. On November 16th, he was transferred to Haddington Hospital for the purpose of getting an artificial limb." Acting Assistant Surgeon J. R. Levis, in charge of the latter hospital, recorded the following result of the case: "At date of admission a fistulous opening existed in the stump, and on examination by the probe the whole wall of this sinus was found to have an osseous fell leading directly to the end of the femur, where loose spiculæ of bone were clearly perceived. A small pledget of sponge tent was applied, and on November, 20th the orifice was well dilated, and, with the dressing forceps, several pieces of bony formation were removed, which crumbled readily under pressure; also a good sized spicula from the sawed surface of the femur. Some inflammation followed this operation, for which lead and opium lotion was applied; perfect quiet

was enjoined, and anodynes given at bedtime. On November 23d, the inflammation was still continuing and the patient suffering intense pain in the stump, but two days afterwards both were subsiding. On December 1st, another examination was made by the probe and another small piece of bone was extracted. By December 10th, his health had improved, the discharge had much lessened, and the stump was doing well, the patient stating that it felt better than at any previous time. In January, 1864, the patient went to his home on furlough, and in the following month, when he returned, the discharge had almost ceased. On March 1st, the sinus had closed and the stump was apparently sound." The patient was subsequently transferred to Christian Street Hospital, and was discharged from service June 7, 1864, and pensioned. Examiner J. Walker, of Bethany, Missouri, certified, May 2, 1874: "I find him unable to wear an artificial limb on account of tenderness and shortness of the stump. He is unable to raise the stump in walking, and wears a wooden peg with a leather socket, buckled around his waist. He is also unable to raise the peg, but moves it by moving the side of his body. The stump chafes so easily that he can wear the socket but a short time, and then has to use a crutch." The pensioner was paid June 4, 1879. The bones comprising the knee of the amputated limb were transmitted to the Museum by Surgeon Lidell, and the involucrum and sequestrum, removed at the second operation, together with a cast of the stump, were contributed by the operator. (*Cat. Surg. Sect.*, 1866, pp. 341, 309, and 555, *Specs.* 1336, 2602, and 1529.) *Specimen* 2602 is represented in FIG. 1 of PLATE LXX, opposite p. 242.

CASE 465.—Corporal H. H. Ellis, Co. I, 16th New York, aged 23 years, was wounded in the left knee, at Fredericksburg, May 3, 1863. Five days after the injury he was admitted into Douglas Hospital, Washington, whence the following history was received: "On examining the wound it was found that a conical ball had fractured the patella so extensively as to involve the joint. On May 13th, there were symptoms of synovitis, and the thigh was amputated at the lower third, by the circular method, by Acting Assistant Surgeon J. E. Smith. Portions of clothing were removed from the amputated knee, and an examination showed that the patella had been broken into numerous fragments, that a fissure extended through the inner cartilaginous face of the bone, and that synovitis had been developed. The patient was broken down with diarrhœa. The stump was dressed with alcohol, and stimulants, quinine, and nutrients were given as largely as possible. The general condition of the patient was so unfavorable that no effort at repair was perceptible in the stump for many days. On May 20th, a hæmorrhage of several ounces occurred and was controlled by pressure. During the following night the bleeding recurred so freely as to render a ligation of the femoral artery necessary, which was performed below the profunda on May 21st. The patient was so prostrated from the loss of blood that he almost died from the effects of the ether. The most careful administration of whiskey, ammonia, valerian, and morphia alone sustained his life during the next forty-eight hours. There was no recurrence of hæmorrhage after the ligation, nor did this ligature of the main artery produce the slightest perceptible effect upon the appearance of the stump. The usual changes were resorted to in the various astringents given for the diarrhœa, nitrate of silver, opium, tannin, and sulphuric acid, all proving at first beneficial and then losing their effect. Lemon juice was given, as the patient's stomach would bear it, with evident benefit as an antiscorbutic. For weeks the patient hung between life and death. His whole thigh was much swollen and very tender on pressure; the incisions were healthy in appearance, the discharge moderate, and the granulations very tedious. Under a careful treatment he gradually grew stronger, his diarrhœa ceased, and the stump, though yet greatly swollen, became closed excepting at the inner extremity, where the end of the femur protruded, the flaps from the first having been insufficient. On August 9th, Dr. Smith was ordered to remove the exfoliating end of the bone, which was loose, and, to his surprise, proved to be a very extensive sequestrum ten inches in length. Considerable hæmorrhage supervened, but after the operation convalescence was very rapid, and the stump, no shorter than before, soon closed entirely, being firm and in every way satisfactory. A formation of new bone could be plainly felt in it. The patient regained his flesh and strength, and left the hospital October 26, 1863, his term of service having expired May 22d." The history, with the sequestrum, represented in FIG. 1 of PLATE LXIX, opposite p. 224, and the bones of the amputated knee, were contributed to the Museum by Assistant Surgeon W. Thomson, U. S. A., in charge of Douglas Hospital. A ligamentous preparation of the latter specimen constitutes No. 1852 of the Surgical Section. The patient was subsequently an inmate of the Post Hospital at Albany, and afterwards entered Central Park Hospital, New York City, to be fitted with an artificial limb by Dr. E. D. Hudson. He left for his home June 6, 1864. His pension was paid June 4, 1879. (See wood-cut 64, p. 63, *Circular* 6, S. G. O., Washington, Nov. 1, 1865.)

CASE 466.—Private J. Nash, Co. G, 143d Pennsylvania, aged 21 years, was wounded at North Anna, May 22, 1864. He was admitted to the field hospital of the 4th division, Fifth Corps, where Surgeon C. W. Chamberlain, U. S. V., recorded: "Severe shot wound of right knee joint by musket ball." From the field hospital the wounded man was conveyed to Port Royal, and thence by steamer to Washington. Surgeon D. W. Bliss, U. S. V., reported that "the patient entered Armory Square Hospital May 29th, having undergone circular amputation of wounded limb at the lower third of the thigh the day previous to his admission, while on board of the hospital transport." On July 22d, the patient left for his home on furlough, whence he returned several months afterwards, and subsequently he was transferred to Judiciary Square Hospital. Surgeon E. Griswold, U. S. V., in charge of the latter, reported that the presence of necrosed bone in the stump having been indicated by suppuration, a tubular sequestrum, eight and three-fourths inches long, was removed on April 9, 1865, by Acting Assistant Surgeon F. H. Hill. On June 22, 1865, the patient was discharged from service and pensioned, having been previously supplied with an artificial limb by the Jewett Patent Leg Company of Washington, D. C. His pension was paid March 4, 1879. The sequestrum (*Cat. Surg. Sect.*, 1866, p. 308, *Spec.* 144) is shown in FIG. 2 of PLATE LXIX, opposite p. 224.

Eight of the patients who recovered after intermediary amputation in the lower third have died since the close of the war. In the following instances the pensioners survived the operation three and nine years respectively:

CASE 467.—Private J. Glassie, Co. B, 63d New York, aged 22 years, was wounded at Cold Harbor, June 3, 1864, and admitted to the field hospital of the 1st division, Second Corps. Surgeon W. S. Cooper, 125th New York, noted: "Shot wound of left leg; amputation at lower third by Surgeon P. E. Hubon, 28th Massachusetts." One week after the reception of the injury the man was admitted to Emory Hospital, Washington, where Surgeon N. R. Moseley, U. S. V., recorded that the limb was

re-amputated above the knee on June 20th, also that abscesses formed subsequently, and that the stump of the femur became hypertrophied. On March 10, 1865, the patient was transferred to Central Park Hospital, New York City, whence Surgeon B. A. Clements, U. S. A., reported the following: "When admitted, the end of the stump was red and inflamed, and there were three sinuses leading to necrosed bone. On March 19th, chloroform was administered, and a sequestrum about eight inches long was removed by Acting Assistant Surgeon S. Teats. The patient did well after the operation. By July 15th, the stump had entirely healed, and one month later he was discharged from service." The man subsequently became a pensioner. He died at Brooklyn, New York, November 12, 1867. The removed fragment was contributed to the Museum by the operator, and constitutes *Specimen* 3100 of the Surgical Section. A representation of it appears in FIG. 3 of PLATE LXIX, opposite p. 224.

CASE 468.—Private Alexander McConkey, Co. D, 63d Pennsylvania, aged 48 years, was wounded at the Wilderness, May 5, 1864, by a conoidal ball, which entered on the inner condyle of the left knee, passed through the joint, and made its exit on the opposite side. He was conveyed to Washington, and admitted into the Harewood Hospital on May 14th. Surgeon R. B. Bontecou, U. S. V., furnishes the following notes of the case: "An examination of the injury was immediately made; the soft parts around the wound were found much inflamed and the joint œdematous. His general condition being good, it was decided to amputate without delay, and the patient being chloroformed, Surgeon Bontecou removed the thigh in the lower third by the lateral flap operation. The stump healed favorably, the ligatures came away on the eighth day, and the patient progressed well on a supporting diet until, July 29th, he had so far recovered as to be about on crutches, when he accidentally fell, injuring the stump, which became inflamed; alcohol and water dressings were applied. On August 4th, an abscess was opened, which discharged about four ounces of pus. 5th, he had a severe attack of diarrhœa, which was checked by proper treatment. 30th, condition very good; a small sinus still exists, owing to some necrosed bone." He was transferred to Pittsburg, April 3, 1865, and admitted into hospital there. The wound had entirely healed, and he was discharged May 19, 1865. He was pensioned, and died May 15, 1873; the cause of death is not satisfactorily given. The pathological specimen, showing the bones of the left knee, with the articular extremity of the femur shattered (No. 3066, *Sect.* I, A. M. M., *Cat.*, 1866, p. 338), was contributed by the operator, who also furnished a photograph of the stump, which is copied in the adjoining wood-cut, FIG. 195.

FIG. 195.—Appearance of thigh stump after lateral flap operation. [From a photograph.]

Fatal Cases of Intermediary Amputation in the Lower Third of the Femur.—This group comprises four hundred and fifty-nine operations performed on four hundred and fifty-seven patients, in two instances intermediary amputations in the lower thirds of both thighs having been performed:

CASE 469.—Private W. Sailor, Co. E, 119th Pennsylvania, aged 40 years, was wounded in the left leg by a conical bullet, at Rappahannock Station, November 7, 1863. Two days afterwards he was admitted to Stanton Hospital, Washington, whence Surgeon J. A. Lidell, U. S. V., made the following report: "On examination, it was found that the injured leg was much swollen and dark colored on its anterior surface, that there was no pulsation in the anterior tibial artery, and that both the tibia and fibula were extensively comminuted, with much laceration of the soft parts. His pulse was frequent and irritable, and he had a good deal of constitutional disturbance and fever of an irritative type. On November 14th, the fever had abated, and the general condition much improved; pulse fuller and less irritable; appetite better; wound suppurating; discharge thin, dark colored, and offensive; leg not improved. There being manifestly no hope of saving it, the bones being broken and the soft parts inflamed nearly up to the knee joint, and comminution very extensive, the limb was amputated in the lower third of the thigh. The operation was performed by the circular method by Assistant Surgeon G. A. Mursick, U. S. V., under sulphuric ether. A dissection of the amputated limb showed that the bones were extensively comminuted as high up as the head of the fibula. The anterior tibial artery was found to be divided by the bullet a little below where it passes through the interosseous membrane, the ends being separated from each other about one inch and retracted within the sheath, also closely contracted. The cardiac end was plugged up by a firm coagulum about an inch in length. The distal end was also plugged up by a small coagulum. The anterior tibial muscles were pale yellow in color, soft and greasy to the touch (fatty degeneration). The patient bore the operation well. The stump was dressed with lead sutures and adhesive plaster, and a full dose of morphine was administered. He had a good night's rest after the operation, and, on the following day, expressed a desire for food, his pulse being full, frequent, and quick; bowels confined, for which a dose of rochelle salts was ordered. On November 17th, suppuration commenced, but little of the stump being united by adhesion; general condition good. Prescribed moderate stimulation, with whiskey. 18th, edge of posterior flap looked sloughy; ordered diluted Labarraque's solution to the stump, and twenty drops of muriated tincture of iron every six hours internally. 20th, had a chill in the morning, followed by fever and sweat; skin sallow looking; granulations in stump looking well, except on the posterior flap, a small portion of which was sloughing. Ordered five grains of quinine every six hours, twenty drops of muriated tincture of iron every four hours, and one ounce of whiskey every three hours. 21st, had a chill in the afternoon; sallow appearance of skin deepened; pulse irritable; slight subsultus; bowels not moved for two days. Ordered ten grains of aloes and twenty grains of rhubarb to be given at once, and continued other treatment. 22d, had chills again in the afternoon, with slight delirium. Ordered one-twelfth of a grain of corrosive sublimate, with three grains of iodide of potassa, every four hours, and continued the whiskey. 23d, patient vomited in the morning, had also a good deal of fever. Applied sinapism to epigastrium. 24th, rigors, etc., in the morning; treatment

continued. 25th, rigors, fever, and delirium; skin very yellow. 28th, rigors, etc.; urine passed involuntary; bedsores on sacrum. Ordered a water bed. Patient died, exhausted, on December 1, 1863, the seventeenth day after the amputation and the eleventh day after the advent of the purulent infection. Autopsy twelve hours after death: Rigor mortis well marked; skin yellow; some emaciation; stump swollen and œdematous; femoral artery well plugged up in stump; end of femoral vein well sealed up in stump; femoral vein empty and collapsed from the end up to the valve at the first anastomosing branch, a distance of about six inches; the vein in this situation about as large as the artery; the walls of the vein also much thickened, being about as thick as those of the artery; the lining membrane looking velvety, wrinkled, and dirty gray in color; no pus in vein. From the valve above mentioned up to the mouth of the vena profunda, a distance of about two and a half inches, the femoral vein was filled to distension with fetid broken down liquefied blood, its lining membrane dirty gray colored in this situation, and its walls somewhat thicker than natural; no pus revealed in this locality by the microscope. At the mouth of the vena profunda the femoral vein was plugged up with yellowish white fibrine; vena profunda and many of its branches filled and knotted with recent coagulum; femoral vein also filled with recent coagulum above the mouth of the profunda to a distance of about two and a half inches; the lining membrane of the profunda and part of the femoral vein last mentioned stained dark red, and the walls of the vessels somewhat thickened in same locality. A thin dark colored recent coagulum, not filling the calibre of the vein, extended the whole length of the external iliac. The end of the femur in the stump (FIG. 2, PLATE XLIII, opposite) was necrosed to the extent of nearly half an inch, and here the periosteum was thickened, varying from a line to one-third of an inch, detached and gangrenous; underlying bone white in color; medullary membrane at end of bone gangrenous and dirty grayish green in color to the depth of about one-third of an inch; medullary membrane elsewhere more vascular than natural, which was well shown by splitting the bone lengthwise with a saw (FIG. 1 of PLATE XLIII, opposite). Three or four small superficial abscesses were formed about the right extremity of the spleen; the rest of that organ was contracted and indurated. Five or six small superficial abscesses were discovered in the lungs, the pulmonary tissue surrounding each of them being consolidated by inflammatory action. The other organs were natural, and the blood did not exhibit any abnormity." The femoral artery (*Spec.* 1887) and the femoral vein (*Spec.* 1888), together with three inches of bone from the stump (*Spec.* 1890), and the section of the spleen containing the metastatic abscesses (*Spec.* 1889, shown in FIG. 3, PLATE XLIII, opposite), were contributed to the Museum by Dr. Lidell.

In the following instance a shot injury of the inner condyle of the right femur was followed by severe secondary arthritis, which necessitated amputation. The autopsy revealed suppurative osteo-myelitis:

CASE 470.—Private *J. N. Saxon*,[1] Co. D, 9th Louisiana, aged 27 years, was wounded in the right knee, at Rappahannock Station, November 7, 1863, and suffered amputation at the Stanton Hospital, Washington. Surgeon J. A. Lidell, U. S. V., who performed the operation, described the case as follows: "A conical bullet entered the knee about three inches above the patella, on a line with its inner margin, passed backward, downward, and a little inward, and escaped at the inner posterior side, about six inches below the joint. The inner condyle of the femur was fractured by the missile passing through it, but without opening the cavity of the joint. The patient stated that his knee was bent at the time of the infliction of the wound. He was admitted two days after the injury and did well, having good spirits, good appetite, and but little pain or swelling of the parts until the night of November 16th, when he had a severe chill, accompanied with great pain in and about the knee, and the injured parts became hot and swollen. On the following morning he exhibited great constitutional disturbances: skin hot; tongue coated white; pulse very rapid, gaseous, and weak. The injured knee was much swollen and exquisitely tender, and he complained of intense pain in it; the anterior orifice of the wound presented a gelatinous appearance, with elevated and everted edges. The patient appeared so feeble that I thought he would not then bear the shock of an amputation, and ordered him to take whiskey freely with anodynes. The next day, November 18th, his general condition appeared unchanged with the exception of his pulse, which was stronger and not gaseous, being 120 by the watch. He had not slept during the night, and complained of great pain in the knee, which was rather more swelled, and the tumefaction was extending up the thigh. The wound presented the same gelatinous appearance as the day before, and the skin over the saphenous veins looked purple colored, but the veins did not exhibit any induration. The thigh was amputated at the lower third, by the flap method, at 1 P. M., about thirty-six hours subsequent to the accession of the secondary arthritis. The patient was under sulphuric ether and bore the operation well. Examination of the amputated member showed the inner condyle of the femur to be extensively comminuted. There was a layer of yellowish gray colored plastic exudation on the articulating surfaces of the fragments in the joint, and the cavity of the joint contained about three ounces of reddish brown colored liquid, in which shining globules floated resembling oil in appearance. The synovial membrane was reddened, especially the pouches of it in relation with the quadriceps extensor cruris. The subcutaneous areolar tissue was infiltrated with a yellowish serum. The bullet was ascertained to have passed behind the joint. On the day following the operation the patient's tongue was coated and his appetite poor; he had also moderate diarrhœa, the evacuations being very offensive. Five grains of blue mass was given at night, and free stimulation with whiskey. On the 20th, the patient was comfortable and the stump looked well. The diarrhœa was unchanged, but during the following several days it gradually abated and the patient progressed well in every respect. 28th, patient cheerful; tongue clean; appetite good; bowels regular; stump but little swollen; granulations healthy; suppuration moderate in quantity and laudable in quality. 30th, patient appeared to be doing well, but complained a good deal of pain in and about the stump. December 1st, patient restless and complaining of increased pain in the stump, especially about the end of the bone; no preternatural swelling, redness or heat in the stump. Prescribed one-fourth of a grain of sulphate of morphia and one drachm of Hoffman's anodyne every four hours. 2d, patient more restless, appearing much agitated and very nervous, having slept but little, and complaining of agonizing pain about end of bone and end of femoral artery. There were exacerbations in the pain and sometimes the whole stump ached, but there was no febrile excitement and nothing untoward in the appearance or feel of the stump; neither was it

[1] LIDELL (J. A.), in *Surgical Memoirs, * * by the United States Sanitary Commission*, New York, 1870, Vol. I, p. 358, gives a detailed account of this case.

UNIVERSITY
CALIFORNIA

swelled, red, or hot. 3d, patient had a bad night, and complained much of sickening pain in end of stump and in bowels. About 7 A. M. the ligature separated and a most profuse hæmorrhage occurred, the blood pouring out in a stream as large as the calibre of the artery. It was finally stopped by digital compression, but, in the meantime, he had lost more than six pounds of blood, which brought him very low. He was stimulated as freely as possible with whiskey and carbonate of ammonia, but did not rally, and died about 3 P. M. Autopsy twenty-three hours after death: Surface of body very pale and waxy (exsanguinated); rigor mortis strong; superficial lymphatic ganglia lying along the vena saphena magna of amputated thigh all enlarged and exhibiting a faint reddish hue on section; deep ganglia not affected; stump not œdematous and no part sloughy; stump healed throughout except in the track of the ligatures and at the end of the bone. The femoral ligature had come away and the end of the vessel was patulous, uncontracted, and unobstructed. The c ats of the artery were infiltrated with blood (recent) at its end and for about half an inch above it. A branch of considerable size was given off from the artery about three-fourths of an inch above its end, which had apparently interfered with the formation of a suitable clot for the permanent plugging up of the vessel; there had been but little effort towards occlusion. No other abnormity existed in the artery. The end of the femoral vein was well sealed up, the vein itself diminished in size up to the nearest valve, a distance of about an inch, and its walls thickened in same locality so as to equal those of the femoral artery; lining membrane not stained with blood; no emboli and no thrombi found anywhere, and no vein presenting any abnormity, the vena profunda not being overlooked. A remarkable osteophyte was found in relation with the femoral artery and vein at their respective ends in the stump. It was developed from (connected with) the linea aspera, a little above the end of the femur, and thence passed horizontally inward, separating or forking into distinct plates, toward the ends of which the one laid in front of and was closely adherent to that side of the artery at and near its end; the other laid behind and was adherent to the vein at and near its end. This osteophyte was about seven-eighths of an inch wide where broadest, and about one-fourth of an inch thick. It was of recent formation. The lower part of the femur in the stump was moderately enlarged by deposit (laminated) of new bone beneath the periosteum (hyper-nutrition); this membrane was detached for about one-fourth of an inch above the line of the saw all the way round the bone, which presented a dull white color in that locality. The medullary membrane was noticed to bulge out a good deal at the end of the bone and to present a dark red or reddish brown color. It was also strong and tough (flesh like). On sawing through the lower part of the femur lengthwise and cleaning off the bone dust the medullary membrane was seen to be more vascular than natural; the medullary tissue exhibited about a dozen small milk-colored abscesses on the surface of the section, showing pus under the microscope, and varying in size from that of a split pea to a mustard seed. The osseous tissue outside of the medullary canal was more compact and heavier than natural in the same locality. The periosteum was thickened to the extent of from one to three lines and more vascular than natural, the thickening being greatest where it had been detached from the bone. There was also a small abscess, flattened in shape, and holding about an ounce of cream-like pus, in the quadriceps extensor cruris muscle, and the red muscular tissue in immediate relation with it was changed to a dark brown color, which, however, did not extend to any depth. The spleen was enlarged, and the other organs all exsanguinated but presenting no other abnormity." The bones of the knee of the amputated limb (*Spec.* 1819), the femoral vein and artery (*Spec.* 1892), with portion of the osteophyte attached, and a longitudinal half section of the lower end of the stump of the femur (*Spec.* 1860, shown in FIG. 4 of PLATE XLIII, opposite p. 290) four and one-fourth inches long, were contributed to the Museum by the operator.

Gangrene of the thigh stump was reported in forty-seven instances, and, in the following instance, tetanus, which appeared on the tenth day after the amputation, hastened the fatal issue:

CASE 471.—Captain *W. E. Davis*, Co. B, 30th North Carolina, aged 25 years, was wounded in the skirmish at Kelly's Ford, Virginia, November 7, 1863. He was conveyed to the hospital of the Third Corps, and, November 10th, was transferred to Washington and admitted into Douglas Hospital. Acting Assistant Surgeon Carlos Carvallo reported that the ball entered the anterior external aspect of the right leg about two and a half inches below the inferior edge of the patella, one and a half inches external to the median line of the leg, and one and a quarter inches below the head of the fibula, where it fractured the bone, and descending downward, inward, and backward, emerged in the posterior internal aspect of the leg, midway between the inferior edge of the patella and the internal malleolus, internal to the bulk of the gastrocnemius muscle. The right foot was cold, of a purple hue, and entirely senseless; the leg, from knee to upper portion of lower third, was swollen and emphysematous, and the middle third was of a yellow and dark green, intermixed with a brown-purple hue. Diagnosis: Gangrene of the foot and leg from gunshot wound of leg, with, most probably, injury and obliteration of the main arteries. Amputation was the sole treatment indicated, the foot and lower portion of the leg being completely mortified. Assistant Surgeon W. Thomson amputated the thigh at the lower third by the circular method. The femoral was secured by digital compression and the tourniquet. Very little arterial blood was lost. A grain of morphia was administered in a half ounce of whiskey immediately after the operation, he having readily revived from the ether narcosis, and he stated that he had slept undisturbed during the operation, without dreaming, and was now entirely free of pain. The cut surface of the stump showed the tissues infiltrated and of an unhealthy appearance. Stimulants were administered. The stump was dressed with dry charpie. At night the pulse was 130, tongue moist, skin dry. The stump was boggy and crepitant to pressure, and a dark discoloration was visible on the external aspect extending to the tensor fascia lata. November 12th, towards evening a line of demarcation was visible of a large slough in external side of skin flap, no discharge from stump; tension of the skin caused by three sutures, which were removed, followed by gaping of the flap. About 9 P. M., the pulse became frequent (145), and there was great paleness of the conjunctiva and skin. The extensive sloughing, weak pulse, and anæmic appearance presented a hopeless prognosis. Late in the evening, a strong solution of bromine was directly applied to the surface of the stump by means of charpie. The application was at first painless, but, after penetrating the mortified tissues and coming in contact with sensitive parts, it caused such pain that the patient was fortified during the operation by a half ounce of sherry wine in powdered ice and one-half grain morphia. 13th, Dr. Holly touched the line of demarcation (which was very well marked, and extended to the whole circumference of the stump) with pure bromine, by means of a flattened stick, in order to facilitate and hasten the efforts of nature. He also applied Dr.

Thomson's solution of bromine (composed of one drachm of pure bromine, three drachms of bromide of potassium, and three ounces of water), by means of a glass pipette, to all the sinuses beneath the mortified integuments and the sinuses near the arteries; besides this application, after carefully washing the stump with "blue wash" (solution of permanganate of potassa), and protecting the integuments outside with castor oil and the surface of the stump with a thin muslin rag, the vapor of bromine was administered by pouring an ounce of solution of bromine on charpie; this was applied to the face of the stump and covered with simple cerate spread on sheet lint and inclosed by oil-cloth and a bandage. The application of bromine was repeated at 1 and 7 P. M., and the nourishing food and stimulants continued. An injection of soap and water caused the first passage since the date of the injury and gave great relief. 14th, the effects of the bromine yesterday had hermetically sealed the surface of the stump, covering it with a yellowish gray matter, which was removed as much as possible, a large amount of mortified integuments being cut away and three loose ligatures removed. Decubitus of gluteal region, somewhat to right of sacral bone; bedsore the size of the palm of the hand, with a yellow greenish slough, which was partly removed with the assistance of a scissors. India-rubber rings employed, and ointment of cinchona bark. Bromine was freely applied four times during the day. There was an abundant discharge of thin unhealthy pus, and the removal of a great quantity of slough discovered a red granulating surface. 15th, wound dressed with bromine at 9 A. M. and 4 P. M. Doing very well; slough removed in large pieces. 17th, large quantity of sphacelated integuments removed and vapor of bromine applied. The stump was exposed for an hour to a painter's view. 18th, the decubitus is becoming the most painful and prominent feature of his complaint. For the first time he had a free passage without adjuvants; slept on his belly. On the 19th, he was put on a water bed, on which he lay much easier. An extensive slough was removed from the inferior portion of the flap, as also from the decubitus, which discharges healthy pus in large quantity; could see an artery pulsating. Bromine applied to bedsore. Patient felt bright, and eat a hearty dinner. In the evening, he complained of a little pain in his throat resembling tonsilitis. 20th, on examining the patient's throat, it was found that he could only open his jaws enough to show the tip of his tongue. Tetanus diagnosticated. Nutritious diet and stimulants were given as usual. At 4 P. M., a laxative was administered. The decubitus was dressed with pulverized cinchona. The stump, which had a beautiful red granulating surface, with one single ligature, was dressed at night with castor oil. He had had contractions and jerking of the stump once in the morning, but had not paid any attention to it until 6 P. M., at which time it became more frequent, recurring nearly every half hour; three ounces of brandy and a half grain of morphia were ordered at 10 and 12 P. M. and 2 and 4 A. M. 21st, trismus well confirmed. Contractions of glottis muscles and fits of suffocation after taking fluids, though administered in small quantities and through a pipette. There was rigidity of the masseters and sterno-cleido-mastoid muscles, and of the muscles of the back of the neck, which were quite hard. The head inclined backward and to the left side; difficulty of articulation. The difficulty of swallowing increased and only fluid nourishment could be taken. He gradually sank, and died November 22, 1863, of asthenia. A *post-mortem* examination of the stump was made November 24th. There was a natural clot of blood at the distal end of the femoral artery. The neurilemma of the sciatic nerve appeared thickened, and the fibres of the nerve more gross and coarse than usual. The ends of several nerves were strongly attached to the external surface of the stump. The body and spine were not opened. A drawing, by Hospital Steward E. Stauch, of the gangrenous stump, is copied in the chromo-lithograph, PLATE XXI, opposite.

CASE 472.—Sergeant D. A. Barnett, Co. B, 99th Pennsylvania, aged 22 years, was wounded at Kelly's Ford, November 7, 1863. Surgeon J. W. Lyman, U. S. V., recorded his admission to the field hospital of the 1st division, Third Corps, with "shot wound of left knee joint." Two days after the reception of the injury the wounded man was transferred to Douglas Hospital, Washington, whence Assistant Surgeon W. Thomson, U. S. A., reported the following history: "The patient was anæmic when admitted, and stated that very free hæmorrhage took place the moment he was wounded. He was struck by a bullet, which entered the leg at the lower border of the patella, and was removed through an incision at the median line posteriorly, four inches above the joint. An examination showed the probable obliteration of the main vessel, since there was no circulation in the foot, which, with the leg half way to the knee, was cold and purple or tallow colored, and in the early stages of traumatic sphacelus. This, added to the direct wound of the knee joint, rendered an operation necessary, which was performed on November 10th. Ether was given, and the limb was removed by Acting Assistant Surgeon P. R. Holly, at the lower third of the thigh, by the circular method, with a straight cut from the wound of exit to the point of the circular incision. The operation was well borne and there was no serious loss of blood. On examining the amputated leg, I found that the ball had comminuted the patella and passed through the femur, entering at the outer margin of the inner condyle and dividing the popliteal artery. The popliteal space contained a large quantity of coagulated blood, and the ends of the vessel were surrounded by a mass of pink-colored and semi-organized clot, sufficiently firm to prevent hæmorrhage. The patient's tongue was very pallid and his whole appearance anæmic. His leg soon became swollen though perfectly white, resembling a case of phlegmasia alba dolens. The skin was smooth and blanched; there was tenderness along the line of the bone and no vigorous effort at repair, the edges of the incision being pale. The discharge consisted of dark colored ill-looking pus, and the whole appearance of the stump was unfavorable; the edges gaped widely apart. On November 20th, a slight slough appeared on the posterior lip of the stump, and two days afterwards the patient had a severe chill, followed by profuse perspiration in the night and succeeded by a light cough. During the night of the 23d there was another severe chill, and the next day respiration was increased in frequency and accompanied by pain in the right side. There was no perceptible dullness on percussion, but on auscultation it was found that inspiration was deep and a little labored, while the expiration over both lungs anteriorly was prolonged almost as in phthisis. There was no rale, but the expiratory sound seemed to indicate that the whole lung had lost some of its elasticity and returned upon itself after dilatation with apparent difficulty. Expectoration was slight, very tough and viscid; the pulse rapid and feeble; the skin relaxed. The pulse became still weaker, and the respiration more hurried until almost sighing; the nervous depression increased. The breath had the sweet sickening smell resembling the odor of fermentation, which denotes pyæmia. Death occurred at 8 A. M. on November 26, 1863. The *post-mortem* examination was made six hours afterwards. On opening the right pleural cavity we found the lung coated with soft greenish colored lymph, and there was an effusion amounting to six ounces of yellow pus and serum, separating into two strata, the upper serum, the lower pus, and having (under the microscope) the usual pus corpuscles floating in a fluid with an abundance of unrecognizable debris. There seemed to be also a thin

layer of pus beneath the pleura anteriorly, giving that portion of the lung a yellowish color. The upper lobe was apparently normal; the lower lobe posteriorly was congested, dark in color, and, on division, revealed nodules of tissue of various sizes in all stages of pathological changes from acute congestion to thorough hepatization and yellow softening. The diseased spots were in dimension from the size of half an English walnut to that of a split pea, the large ones having in the center a space white or yellow in color, and probably breaking down rapidly. The outline of these solidified portions, on section, suggested the idea of embolism, since they were somewhat triangular in shape, with the base at the pleural surface and the apex at the deepest portion of the lung, giving the impression that a circumscribed area of lung nourished by a single vessel had been destroyed by its occlusion. There was no recent effusion in the left pleural cavity, but changes in the parenchyma similar to those on the right side were discovered. An examination of the vessels of the stump revealed the existence of inflammation of the artery and veins. Both the femoral artery and vein at the point of their escape from the pelvis were normal. The femoral vein at the entrance of the saphena was filled with a semi-organized clot, which extended through the saphena and femoral to a point two inches from the cut ends of these vessels, where they had been divided on the face of the stump. (See left-hand figure of PLATE XX, opposite p. 294.) These vessels, as will be seen, are now hard and firm dark-red cords, of course entirely impervious. The artery from the origin of the profunda to a point two inches from its cut termination was also reddened, and its inner coat softened and easily removable. The phlebitis, with its occlusion of the main venous trunks, accounted for the swollen and white condition of the stump, compared above to the condition known as phlegmasia alba dolens. In making this dissection it was observed that the inflammation, apparent in the artery and to some extent circumscribed (since its lower extremity yet contained the clot formed on the application of the ligature and was normal both in color and firmness, as well as that which occluded the veins), had extended through the coats of these vessels from without. No pus was found in the veins, and no evidence of inflammation except the marked redness of the coats and the firm and clotted coagulation of the blood within." Wet preparations of the femoral and profunda arteries (*Spec.* 2246), the femoral and saphena veins (*Spec.* 3991), and the popliteal artery and vein (*Spec.* 2247), saved from the stump, were contributed to the Museum by Assistant Surgeon Thomson. Drawings of the specimens 3991 and 2246 were prepared by Hospital Steward Stauch, and are represented, the former on the left and the latter on the right side of PLATE XX, opposite p. 294.

CASE 473.—Corporal *L. C. Griffin*, Co. D, 8th North Carolina, was wounded in the left knee by a piece of shell, at Winchester, July 19, 1864. He was conveyed to hospital at Richmond, where the limb was amputated at the lower third of the femur by Dr. Joseph Jones. The patient died in February, 1865. The specimen, a portion of the stump four and a half inches long, was contributed to the Museum by Acting Assistant Surgeon F. Schafhirt. It constitutes number 3141 of the Surgical Section, and exhibits a prodigious involucrum. The bone is exceedingly hyperostosed, measuring three and a half inches in diameter at the extremity. The extremity and central portions are carious, and a slight sequestrum is contained. A representation of the specimen will be found in FIG. 4 of PLATE LXX, opposite p. 242.

TABLE XXXVI.

Summary of Six Hundred and Seventy-six Cases of Intermediary Amputations in the Lower Third of the Femur for Shot Fracture.

[Recoveries, 1—217; Deaths, 218—676.]

NO.	NAME, MILITARY DESCRIPTION, AND AGE.	DATES.	OPERATIONS, OPERATORS, RESULT.
1	Anderson, J., Serg't, I, 54th New York, age 32.	July 3, 8, '63.	Left; ant. post. flap; slough.; nec. Aug. 2, flap, mid. third. Surg. C.W. Hägen, 54th N.Y. Hæm.; necro. bone removed. Disch'd Aug. 25, 1864. *Spec.* 4358.
2	Askey, J., Pt., F, 200th Pennsylvania, age 18.	Mar. 25, 28, '65.	Right; circ. Surg.W. G. Hunter, 211th Penn. April 11, hæm.; lig. fem. art. Disch'd July 28, 1865. *Spec.* 3997.
3	Austin, G. H., Pt., D, 106th New York.	April 29, May 22, 1863.	Left (erysipelas). A. A. Surg. R. W. Hazlett. Hæm.; lig. femoral art.; rec'd. Disch'd Aug. 23,'63.
4	Bassett, W., Pt., E, 4th New Jersey, age 20.	June 27, J'y 1, '62.	Right; flap. Disch'd January 7, 1863.
5	Bathurst, J. B., Pt., D, 45th Penn., age 19.	June 4, 16, '64.	Left; circ. A.A. Surg. J. C. Nelson. June 28, nec. bone rem'd. Disch'd Nov. 20,'65. *Spec.* 2584.
6	Bauers, P., Musician, D, 74th Pennsylvania.	April 1, 6, '62.	Left; circ. Surg. J. McL. Hayward, 12th Mass. Erysipelas. Disch'd Aug. 23, 1862.
7	Becker, A., Pt., F, 3d Missouri.	May 10, 19, '61.	Right; flap. Drs. Fellerer and Comstock, St. Louis. Disch'd.
8	Beers, L. R., Corp'l, E, 188th Penn., age 19.	Sept. 29, Oc.29,'64.	Right (gangrenous slough.); circ. A. Surg. S. H. Orton, U. S. A. Gang. Disch'd Nov. 9, 1865. *Spec.* 3682.
9	Bennett, P. L.,Pt., F, 1st Maine Cavalry, age 24.	Aug. 23, 30, '64.	Left; lat. flap. Surg. N. R. Moseley,U. S.V. Nec. Disch'd Aug. 12, 1865.
10	Beverlin, G., Pt., B, 11th West Virginia.	June 17, J'y 5,'64.	Right; circ. Surg. L. R. Stone, U. S. V. M. O. Nov. 11, 1864.
11	Biddle, W. B., Pt., K, 138th Penn., age 27.	Oct. 19, 27, '64.	Left; circ. A.A.Surg.B.B. Miles. Exfol. rem'd. Disch'd July 18, 1865. *Specs.* 109, 3425.
12	Bloomer, S., Serg't, B, 1st Minnesota, age 24.	Sept. 17, 20, '62.	Right. A. Surg. E. G. Pugsley, 1st Minn. Disch'd Dec. 6, '62.
13	Boebel, H., Lieut.-Col., 26th Wisconsin.	July 1, 4, '63.	Right. Disch'd May 28, 1864.
14	Bonhomme, E., Pt., E, 73d Col'd Troops, age 27.	April 10, 24, '65.	Left (April 10, amp.leg.; slough.); circ. Surg. F. E. Piquette, 86th C. T. Disch'd June 17, 1865. Died June 3, 1867; marasmus.
15	Bosworth, C. W., Pt., I, 1st Maine H'vy Art., age 23.	May 19, 24, '64.	Left; flap. Surg. D. W. Bliss, U. S.V. Nec. Disch'd April 10, 1865. Jan. 9,'68, flap, mid. third.
16	Brown, J. T., Corp'l, C, 10th Illinois, age 21.	June 27, J'y 2, '64.	Left (gang.); circ. A. Surg.C.W. Burke, 46th Penn. Gangrene; end of bone rem'd. Mustered out August 31, 1864.
17	Buehler, J., Pt., C, 41st New York.	May 2, 8, '63.	Right thigh; circular operation. Disch'd Nov. 28,1864.
18	Bulmer. B., Pt., A, 71st Pennsylvania.	Sept. 17, 20, '62.	Right. Discharged Dec. 12, '62.
19	Bürle, J., Corp'l, K, 61st New York, age 52.	Aug. 25, Sept. 15, 1864.	Right; double flap. Surg. W. O'Meagher, 37th N.Y. Re-amp. upper third. Disch'd May 30, 1865. Died July 16, 1868.
20	Burwell, T. J., Pt., H, 81st Ohio, age 23.	Mar. 21, Ap. 2,'65.	Right; circ. Surg. A. F. Marsh, 56th Ill. Disch'd Sept. 11, '65.
21	Butler, C. H., Pt., H, 2d Conn. H. Art'y, age 20.	Oct. 19, 22, '64.	Right; flap. A.Surg. J. J. Meigs, 11th Vt. Disch'd Aug. 17, '65.
22	Carlin, J., Pt., I, 3d Vt., age 20.	May 5, 9, '64.	Left; flap. Surg. E. Phillips, 6th Vt. M. O. March 18, 1865.
23	Carpenter, H., Pt., A, 121st N. York, age 24.	May 3, 6, '63.	Left. Confed. surgeon. Disch'd June 15, 1864.
24	Casebolt, T. D., Pt., E, 3d Iowa, age 21.	April 6, 9, '62.	Left; flap. Disch'd Oct. 19, '62.
25	Causdell, J.A.,Corp'l,B, 10th Minnesota, age 27.	Dec. 15, 19, '64.	Left; flap. A.A.Surg. J. H. McIntire. Slough'g. Disch'd May 29, 1865.
26	Claden, M., Pt., I, 108th Ohio, age 31.	May 14, 22, '64.	Right; circ. A.Surg.J.M.Brown, U. S. A. Disch'd May 11, '65.

No.	Name, Military Description, and Age.	Dates.	Operations, Operators, Result.
27	Clarey, P., Pt., I, 24th Michigan, age 18.	July 2, 10, '63.	Left (mortification); circ. Surg. A. J. Ward, 2d Wis. Rem'd nec. bone; gang. Disch'd Feb. 26, 1864.
28	Clark, S. A., Pt., E, 1st Sharpshooters.	Aug. 30, Se. 22, '62	Right; flap. Surg. D. W. Bliss, U. S. V. Disch'd Jan. 29. 1863.
29	Cleggett, T., Pt., D, 76th Colored Troops, age 45.	April 2, 24, '65.	Right; ant. post. skin flap; circ. of muse. Surg. F. E. Piquette, 86th C. T. Hæm.; lig. femoral art. Disch'd July 22, 1865.
30	Cliff, H., Serg't, F, 76th New York, age 34.	July 1, 5, '63.	Left; circ. Disch'd Nov. 28, '63.
31	*Cocheran, F.*, Pt., G, 9th Louisiana, age 19.	July 9, 14, '64.	Right: circ. Fort Monroe, Sept. 20, 1864.
32	*Cochran, P.*, Serg't, A, 19th Tennessee, age 25.	Dec. 16, 29, '64.	Left; ant. post. flap. Ass't Surg. J. H. Cruthers, 88th Ohio. Provost Marshal May 6, 1865.
33	Cooley, G. W., Corp'l, E, 75th Ohio.	May 2, 12, '63.	Right. May 27, amp. mid. third. Disch'd Jan. 22, 1864.
34	Corcoran, P., Pt., C, 100th New York.	July 18, 21, '63.	Right; flap. Disch'd Aug. 25, 1864. Died Jan. 28, 1868.
35	*Crawford, A. N.*, Corp'l, G, 32d Tenn., age 28.	May 16, 19, '64.	Left; circ. A. Surg. H. E. Goodman, U. S. V. Provost Marshal October 21, 1864.
36	*Critse, P. L.*, Serg't, C, 21st Georgia, age 44.	Aug. 21, 29, '64.	Right. Surg. — Edwards, C.S.A. Prison Nov. 22, 1864.
37	Curie, H., Pt., F, 7th Connecticut.	Aug. 16, 19, '64.	Left (August 17, amp. leg); circ. Disch'd June 10, 1865.
38	Curren, T. S., Pt., E, 7th Ohio.	Aug. 26, Sept. 1, 1861.	Right; flap. Surgs. Gleaves, McDonald, and Scarout, C. S. A. Disch'd July 17, 1862.
39	Darling, R. A., Pt., H, 67th New York.	May 31, Je. 3, '62.	Right; flap. Surg. D. Prince, U. S. V. Hæm.; lig. fem. artery. Disch'd August 9, 1862.
40	Darraugh, J. C., Lieut., D, 9th Mich. Cav., age 19.	Oct. 1, 17, '64.	Right; lat. flap. Surg. A. Nash, 9th Mich. Cav. Mustered out.
41	Davis, L., Pt., A, 9th W. Virginia, age 18.	Aug. 26, 29, '64.	Left; circ. A. A. Surg. T. J. Dunott. Sept. 3, hæm. Disch'd Oct. 26, '65. *Specs.* 1423, 1072.
42	Debold, C. A., Pt., H, 21st N. Y. Cavalry, age 21.	July 24, 28, '64.	Left; circ. A. A. Surg. W. S. Adams. Disch'd Dec. 17, 1864.
43	Deery, P., Pt., C, 170th New York, age 55.	Aug. 26, Sep. 7, '64.	Left; ant. post. flap. Surg. A. Heger, U. S. A. Disch'd Aug. 15, 1865.
44	De La Barr, G., Pt., C, 13th Mich., age 16.	Mar. 19, 27, '65.	Left; double flap. Surg. D. S. Young, 21st Ohio. Disch'd Oct. 21, 1865.
45	Devine, J., Lieut., F, 32d Iowa, age 43.	April 8, 12, '64.	Left; flap. Disch'd August 30, 1864.
46	Dilley, J. L., Musician, G, 62d Ohio, age 24.	April 2, 6, '65.	Right; circ. Surg. J. S. Taylor, 23d Ill. Disch'd July 15, 1865.
47	Dillon, G., Pt., F, 40th New York.	Sept. 1, 10, '62.	Left. Disch'd March 14, 1863. Died May 25, 1870.
48	Dimmick, L. L., Pt., G, 10th Wisconsin.	Oct. 8, 24, '62.	Left; circ. A. A. Surg. J. Sloan. Rem'd end of bone. Disch'd April 16, 1863.
49	*Dunlap, R. K.*, Pt., 14th Virginia.	May 3, 7, '63.	——. Surgeons Stroth and Sawyer, C. S. A. Recovered.
50	Ellis, A., Pt., F, 114th New York, age 21.	Oct. 19, No. 7, '64.	Left. A. A. Surg. E. G. Waters. Disch'd May 31, '65. *Spec.* 3423.
51	Ellis, H. H., Corp'l, I, 16th New York, age 23.	May 3, 13, '63.	Left; circ. A. A. Surg. J. E. Smith. Hæm.; lig. fem. artery. Removed exfol. bone. Disch'd from hospital June 6, '64. *Specs.* 1852, 1853.
52	Emigh, B. F., Lieut., F, 2d Penn. H'vy Artil'ry, age 24.	June 17, 25, '64.	Left; circ. A. A. Surg. F. H. Colton. Sloughing; seq. extracted. Disch'd May 10, '65. *Spec.* 3598.
53	Emmert, G. S., Corp'l, H, 37th Illinois, age 23.	Dec. 7, 14, '62.	Right; flap. Surg. P. Harvey, 19th Iowa. Bone rem'd. Disch'd.
54	Everett, D., Pt., L, 15th Kansas Cav., age 18.	June 15, 20, '64.	Right (mortification; 17th, amp. leg; gangrene); ant. post. flap. Disch'd Aug. 19, 1864.
55	Falconer, D. G., Lieut., B, 79th N. Y., age 25.	Sept. 17, Oct. 9, '62.	Right; ant. post. flap. A. Surg. J. B. Brinton, U. S. A. V. R. C. July 20, 1863. *Spec.* 453.
56	*Farthing, G. W.*, Pt., D, 5th Tennessee.	July 2, 7, '63.	Left. Recovery.

In two instances intermediary amputations in the lower third of both thighs were unsuccessfully performed. One of these cases is detailed:[2]

Case 474.—Private D. Wallace, Co. I, 5th Artillery, aged 37 years, was wounded in both legs, at Gettysburg, July 1, 1863, and suffered amputation at the field hospital of the 2d division, Fifth Corps. Assistant Surgeon B. Howard, U. S. A., reported: "The patient was struck by a minié ball, which passed through one knee joint and shattered the patella of the other. A flesh wound was also received by another shot in the upper third of the left thigh. Both thighs were amputated by the circular method in the lower third, in immediate succession, on the third day after the wound was received. Very little blood was lost at the operation, and no appreciable oozing had occurred by the next day, at which time the patient was in such good spirits as to create frequent merriment among his wounded comrades by his funny witticism. His pulse and appetite had both improved." The patient was subsequently transferred to Camp Letterman, where he was received on August 1st, in a very exhausted condition, the stumps not having been dressed for two days; he died on the following day, August 2, 1863. The bones of the knee joints of the amputated limbs were contributed to the Museum by Dr. Howard, and constitute specimens 1383 and 1384 of the Surgical Section. The former consists of a ligamentous preparation of the right knee, from which the patella was shot away; the latter embraces the bones of the left knee, the condyles of the femur being completely shattered.

The amputations in the foregoing table were performed, for shot injuries of the lower third of the thigh, in forty-one; of the knee joint, in four hundred and thirteen; of the leg, in two hundred and two; and of the ankle joint or foot, in twenty instances. The Museum possesses specimens in two hundred and three of the six hundred and seventy-six cases of intermediary amputations in the lower third of the thigh.

Intermediary Amputation in the Shaft of the Femur without Indication of the Seat of Incision.—In twenty-six only of the thirteen hundred and twenty intermediary operations the seat of operation was not specified. Seven had successful and nineteen fatal terminations; a mortality of 73.0 per cent. Eighteen operations were performed on Union and eight on Confederate soldiers. The seat of fracture in the twenty-six cases was in the lower third of the femur in two; in the knee joint, in three; and in the leg, in three cases; in eighteen instances the fracture was recorded to have been in the femur, but the precise point was not indicated. Such meagre details as are reported on the records of this office will be found in the table on the next page.

13	Legler, G., Pt., K, 9th Wisconsin.	April 30, M'y25,'64.	Right. Died June 3, 1864.	26	Weston, H., Pt., K, 15th Illinois.	April 6, 25, '62.	Right. Died May 13, 1862.

SECONDARY AMPUTATIONS IN THE SHAFT OF THE FEMUR.—There were four hundred and forty-two cases in which the amputation in the thigh was practised subsequent to the thirtieth day after the reception of the injury. Two hundred and thirty-nine recovered and two hundred and three died, a fatality of 45.9 per cent., or 3.9 per cent. less than in the series of primary, and 17.8 per cent. less than in the series of intermediary operations.

Secondary Amputations in the Upper Third of the Shaft of the Femur.—Fifty-five operations of this nature were reported, with twenty-five deaths, or a mortality of 45.4 per cent. The operations were performed on forty-five Union and ten Confederate soldiers. In thirty the right limb, and in twenty-one the left limb, was involved, and in four this point was not indicated.

Recoveries after Secondary Amputations in the Upper Third of the Femur.—Thirty of the secondary amputations in the upper third of the femur resulted favorably, six on Confederate and twenty-four on Union soldiers. Twenty-three of the latter were pensioned, and all but one were living in October, 1879. In two cases the lesions were consequent on injuries inflicted by shell, in one by grape shot; in twenty-seven, the injuries were believed to have been caused by small projectiles. Two of the patients had undergone prior operations, one, an amputation of the same leg, and one, an excision of three and a half inches of the upper third of the femur.[1] The convalescence was retarded by pyæmia in one, by gangrene in two, and by hæmorrhage in three instances. In the following case bleeding occurred on the thirteenth day, but was readily controlled by the tourniquet and ice:

CASE 475.—Captain J. A. Bates, Co. D, 12th New York, was wounded in the right leg at Gaines's Mill, June 27, 1862, and underwent amputation nineteen months afterwards. Surgeon A. B. Mott, U. S. V., who performed the operation, made the following report of it: "The wound was caused by a shell which splintered the tibia about midway between the knee and the foot without completely fracturing it. The patient entered Ladies' Home Hospital, New York City, December 25, 1863, and

[1] The amputation of the thigh had been preceded by amputation in the leg in the case of C. Basim, Pt., H, 8th Pennsylvania Reserves (TABLE XXXVIII, No. 2, p. 308), by excision in the shaft of the femur in the case of Pt. S. C. Hall, F, 3d Indiana Cavalry (TABLE XXV, No. 3, p. 208, *ante*, and TABLE XXXVIII, No. 9, p. 308).

thirty days afterwards the limb was amputated. At the time of the operation the leg had become greatly swollen from enlargement of the bone, the skin was discolored with numerous ulcerations, and there was an immense discharge of matter from the ulcers and from an abscess about the knee joint. The patient was in a very low and emaciated condition, had no appetite, and was unable to sleep without taking anodynes. The amputation was performed at the upper third of the thigh by the circular method, and was attended with little hæmorrhage, chloroform being used, and followed by prompt reaction. Ligatures were applied to every bleeding vessel. The patient did well from the time the operation was performed. He was ordered to have two pints of porter and six ounces of brandy daily, together with nourishing diet. Some hæmorrhage took place on the thirteenth day, which was easily controlled with the tourniquet and ice, but recurred one week afterwards. On June 12, 1864, the patient was discharged from the hospital cured." Captain Bates re-entered the Army as an officer of the 43d Infantry, July 28, 1866, and four years later he was retired from active service. He was furnished with an artificial limb by B. F. Palmer, of Philadelphia, July 14, 1869.

In the next case the amputation was not performed until seven years after the date of the reception of the injury:

FIG. 196.—Right femur fractured at junction of upper and middle thirds. *Spec.* 5558.

CASE 476.—Private Jesse M. Jones,[1] Co. K, 21st Indiana, aged 29 years, was wounded at Baton Rouge, August 5, 1862, by a musket ball, which fractured the right femur at the junction of the middle and upper thirds. He was taken to the regimental hospital, remained there one day, and was then sent on a hospital transport to New Orleans, the limb meanwhile being supported by bandages and pillows. On arrival, August 7th, he was admitted to the St. James Hospital, where a long splint was applied, seventeen days after the reception of the wound. He was discharged April 15, 1863, and pensioned. On November 14, 1866, Examining Surgeon W. J. Hoadley, of Danville, Indiana, reports: "The wound still unhealed, fracture had united by large deposits of bone; limb shortened four and three-fourths inches." In January, 1869, he entered Providence Hospital, Washington; and, on the 23d, Dr. D. W. Bliss, late Surgeon U. S. V., amputated the thigh in the upper third by the antero-posterior flap method. The pathological specimen was presented to the Army Medical Museum by the operator. It is No. 5558 of the Surgical Section (FIG. 196), and shows great deformity, with exfoliations on posterior aspect, and a fragment of lead imbedded in the callus. On March 9, 1869, Jones visited the Museum, when his photograph (A. M. M. *Card Photographs*, Vol. I, p. 27) was taken, a copy of which is shown in the wood-cut (FIG. 197). His pension was paid December 4, 1879.

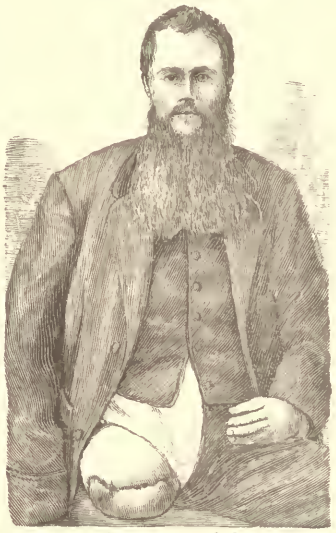

FIG. 197.—Appearance of the stump six weeks after operation. [From a photograph.]

Of four of this series of thirty cases of secondary amputation in the upper third of the femur the specimens are preserved in the Army Medical Museum:

CASE 477.—Sergeant J. Hammill, Co. D, 8th New Jersey, aged 23 years, was wounded in the right knee, at Chancellorsville, May 3, 1863. From the field he was conveyed to Potomac Creek Hospital, and thence, six weeks afterwards, to Washington, where the injured limb was amputated. Surgeon D. W. Bliss, U. S. V., who performed the operation, reported: "The wound was caused by a minié ball, which struck the external condyle of the femur and passed directly through, comminuting the condyles and lower part of the femur and opening the joint. The patient was admitted to Armory Square Hospital, June 14th. He was then suffering from profuse suppuration from the joint, and had a large abscess attended with disintegration of the tissues of the calf of the leg, in consequence of which he was in a very reduced condition. There were no symptoms of pyæmia, however. As there was no possible chance of life for the patient without an operation, it was decided to amputate, which was done on June 16th, by the circular method, at the junction of the middle and upper thirds. The soft parts were found in a very diseased condition. The patient stood the operation well and progressed favorably. Three months afterwards he was transferred to St. Elizabeth Hospital." The man was ultimately discharged from Ward Hospital, Newark, May 4, 1864, having been previously furnished with an artificial limb by E. D. Hudson, of New York City. He is a pensioner, and was paid June 4, 1878. The amputated part of the femur, together with the bones of the knee, were contributed to the Museum by the operator, and are shown in the cut (FIG. 198). The specimen shows a slight deposit of callus on the border of the fracture, and much disorganization of the articulation by suppuration.

FIG. 198.—Shot fracture of lower third of right femur, with slight deposit of callus. *Spec.* 1263.

As already remarked, one of the twenty-three pensioners of this group died nearly fifteen years after the operation:

CASE 478.—Private M. Hartigan, Co. H, 108th New York, aged 18 years, was wounded in the left knee, at Antietam, September 17, 1862. He was moved from a field hospital to Frederick twelve days after the injury, and two days later to Chester, where the injured limb was amputated. Acting Assistant Surgeon C. J. Morton, who performed the operation, contributed

[1] An account of the case has been published in *Circular* No. 3, Surgeon General's Office, Washington, 1871, p. 209.

the pathological specimen (*Cat. Surg. Sect.*, 1866, p. 337, *Spec.* 262), with the following details of the case: "The wound was produced by a ball, which entered near the centre of the popliteal space and emerged at outer side of the knee. The man walked from the battle field to the field hospital. After his admission to Chester Hospital, on October 2d, the wound did well for a few days, when synovitis ensued, and the knee joint became highly inflamed and painful on motion. The patient was also suffering from diarrhœa, poor appetite, and was much emaciated. About a week afterwards large dissecting abscesses formed above and below the knee, which were freely opened, and compresses were then applied to prevent the upward tendency of the abscesses. On October 29th, the muscles were completely dissected with pus to above the middle of the thigh, and the least movement of the limb would cause the most agonizing pain; the patient's appetite now being completely gone and his emaciation very great. On consultation, it was then decided that, as the only means of preserving life, amputation should be resorted to, which was performed about four and a half inches below the great trochanter. The patient spent a wakeful night after the operation, his pulse being 160; but after several days he began to rest better and regained some appetite, and by November 6th his general condition was much improved, the stump healing nicely and showing every prospect of recovery. By December 11th, the stump was nearly healed and the patient had almost recovered. Dissection of the amputated limb showed that the ball had passed through the joint and struck the outer condyle of the femur. The cartilage of the femur and tibia was very much roughened." The specimen consists of a ligamentous preparation of the bones of the injured knee. The patient was discharged from service May 19, 1863, and pensioned. He was subsequently supplied with an artificial limb by the Palmer Arm and Leg Co., by whom the operation was described as having been performed by the flap method. The pensioner died April 1, 1877.

Fatal Cases of Secondary Amputations in the Upper Third of the Thigh.—The twenty-five operations of this group were performed on four Confederate and twenty-one Union soldiers. In one instance excision in the middle third of the femur had preceded the secondary amputation.[1] Four patients perished from pyæmia, two from gangrene, ten from exhaustion, three from shock. In one instance it was believed that chloroform contributed to the unfortunate result,[2] and in five the cause of death was not recorded.

CASE 479.—Private John Pool, Co. H, 119th Pennsylvania, aged 23 years, was wounded by a conoidal ball, at Rappahannock Station, November 7, 1863. He was admitted into the Stanton Hospital, Washington, November 9th. Surgeon John A. Lidell,[3] U. S. V., furnished the following history, with the specimen (No. 2229, Sect I), to the Army Medical Museum: "The bullet had entered the lateral and external part of the left thigh near the junction of the middle and upper thirds, and passing downward, inward, and somewhat forward, had fractured the femur at its middle. The missile appears to have been split, by contact with the bone, into two pieces, which made their escape through separate openings in the popliteal space. When admitted the knee was much swollen and hot; the patella floated some distance above the femoral condyles. He did not complain of pain, and his general condition was favorable. The wounded limb was propped up with long sand bags placed on either side of it, and moderate extension was applied by a weight hanging over the foot of the bed and attached to the foot and leg by strips of adhesive plaster. Counter extension was effected by elevating the foot of the bed. He was put upon supporting diet, and simple dressings applied. The inflammation and swelling at the knee gradually subsided, and, on December 1st, had entirely disappeared, the wounds in the popliteal space closed; the wound of entrance, however, was still open and discharging. On the 20th, there was a slight hæmorrhage of arterial blood from the wound of entrance, which was readily checked. On the 28th, the limb was placed in Hodgen's splint to facilitate the outflow of pus. January 8, 1864, the wound in the popliteal space reopened and the wounds, both of entrance and exit, discharged freely. 24th, pulse 110; he was daily becoming more feeble. On exploring the wound through the orifice of exit with Nélaton's probe detached fragments were found at the seat of fracture. The patient was etherized, and through an incision about four inches long, made in the back part of the thigh, six detached fragments of considerable size, the largest about two inches long by three-fourths of an inch wide, were extracted. The superior and inferior part of the fractured femur were found to be held in proper position by strong splints of provisional callus, which had been thrown out on the inner and outer sides of the bone. The finger could be readily passed between the broken extremities of the bone, both ends of which were necrosed but not yet detached. On the 25th, the thigh had swelled a good deal and was emphysematous, but, on the 28th, the emphysema had disappeared and the swelling was subsiding; the limb was again placed in Hodgen's splint. On the 31st, he was improving in every respect. On February 14th, he was doing finely; no night sweats; slept well; appetite good; pulse 80; discharge of pus moderate. 24th, two fragments of bone were extracted. March 1st, a diffuse inflammation, accompanied with redness and much swelling, attacked the thigh and spread rapidly through the limb; there was also great constitutional disturbance. After a time this inflammation subsided in a great measure but left him much weakened. About April 1st, another attack of diffuse inflammation brought him still lower. 18th, the whole limb was greatly swollen from the groin to the toes; a small slough on the instep separated; the knee joint was extended with effusion, the patella floating some distance above the femoral condyles. There was a profuse discharge of thin pus from the wound of operation in the back part of the thigh. He was much emaciated, pale, and weak; pulse frequent and feeble; tongue red and inclined to be dry; appetite capricious and poor, and he was subject to frequent attacks of diarrhœa. He was steadily

[1] Case of Private C. Collar, F, 45th Illinois (TABLE XXVI, No. 8, p. 210, *ante*, and TABLE XXXVIII, No. 34, p. 308).

[2] Case of Private *J. Bradley*, D, 25th North Carolina (TABLE XXXVIII, No. 32, p. 308), admitted to Chimborazo Hospital, Richmond, June 25, 1862, with a slight wound of patella and integuments covering it, not penetrating joint. July 11th, patella partially necrosed; gangrene appeared on inner and outer aspect of knee joint, showing tendency to spread. July 18th, amputation of thigh at junction of middle and upper thirds. Death July 18, 1862, a few minutes after the operation. A remark on the hospital register explains: "The wound was deemed of trifling importance until the 11th, when the patella was discovered to be necrosed. The chloroform may have contributed to the unfavorable result, for it caused him to vomit freely, and he was unable to retain any stimulants on his stomach."

failing, and, there being no hope of saving his life without amputation, he was placed under the influence of sulphuric ether, digital compression applied to the femoral artery, and the thigh amputated in the upper third, by the double flap method, by Surgeon J. A. Lidell, U. S. V. The femur was sawn off about one and a half inches below the trochanter minor. The soft parts of the thigh were so much diseased as not to admit the performance of the operation at any point below. But little blood was lost during the operation. There was a good deal of shock, but he reacted promptly afterward. In a short time the stump became sloughy; he gradually failed, and died of exhaustion April 26, 1863. On examining the amputated member, extensive burrowing of pus was found among the muscles of the thigh, and numerous small pieces of the bullet and fragments of bone sticking into the soft part around the seat of fracture. The ends of the broken femur were not in apposition, but separated from each other by the space which had formerly been occupied by the fragments of bone extracted by operation. Pretty firm union had, however, taken place by means of a bridge of new bone which arched over the chasm in front. On splitting the femur open lengthwise with a saw the marrow presented a coppery-red color, and there were abundant deposits of new reddish colored osseous tissue both within the medullary canal, endostosis, and, external to the bone, periostosis, for a considerable distance above the fracture. In the marrow below the fracture there was a large-sized chocolate-colored spot, the result, apparently, of an old extravasation of blood. The substance of the marrow was decidedly tougher than normal. There was a considerable deposit of new osseous tissue lying between the periosteum and the bone. The periosteum itself was thicker and redder than natural in that locality, and from it these laminæ of new osseous tissue had been developed. Th knee joint was swelled out with a straw-colored jelly-like substance; the synovial fringes were reddened, but the articular cartilage presented no abnormity." A drawing of the specimen, No. 2229, by Hospital Stewart E. Stauch, is copied in PLATE LXVI, opposite p. 306.

In the following instance amputation was performed twenty-two months after the injury. The patient had been discharged and pensioned, but the wound reopened, allowing the end of the lower portion of the femur to protrude through a fistulous passage:

CASE 480.—Private P. Riley, Co. A, 10th New York, aged 24 years, was wounded at Cold Harbor, June 3, 1864, and admitted to the field hospital of the 2d division, Second Corps. Surgeon J. F. Dyer, 19th Massachusetts, recorded: "Gunshot fracture of left thigh, upper third." Surgeon J. C. McKee, U. S. A., contributed a photograph, which is shown in the wood-cut (FIG. 199), and reported as follows: "Admitted to Lincoln Hospital, Washington, June 11th, with a gunshot fracture of the left femur, the ball entering the anterior surface of the thigh four inches below the anterior superior spinous process of ilium, passing directly backward, producing a compound comminuted fracture of the upper third of the femur, and lodging in the muscular substance of the thigh posteriorly. Extension and counter-extension were used, but removed on account of the inflammation of the parts and the severe pain produced. Three weeks after admission free incisions were made for the discharge of pus. The patient slowly recovered, with four and a half inches shortening of the limb." He was mustered out of service August 1, 1865, and pensioned. A cast of the injured limb in this case was also contributed by Dr. McKee, and constitutes specimen 4051 of the Surgical Section of the Museum. (See *Cat. Surg. Sect.*, 1866, p. 535.) Examiner W. H. Thomson, of New York City, certified, January 22, 1866: "A ball entered the inner aspect of the left thigh and fractured the femur opposite the great trochanter. The limb is now much distorted and marked with fistulous passages, from one of which, at the anterior upper third of the limb, the end of the lower portion of the femur protrudes. He should not have been discharged from hospital in that condition." Dr. M. M. Marsh, Surgeon at the Lincoln Hospital, New York City, certified: "That in the month of April, 1866, Peter Riley came into the hospital for an operation on a shattered femur in its upper third, the lower fragment of bone protruding. Amputation was performed, and the patient died of pyæmia May 7, 1866, and in consequence of the injury received in the service as the remote cause." (See *Photo. Series*, A. M. M., No. 117.)

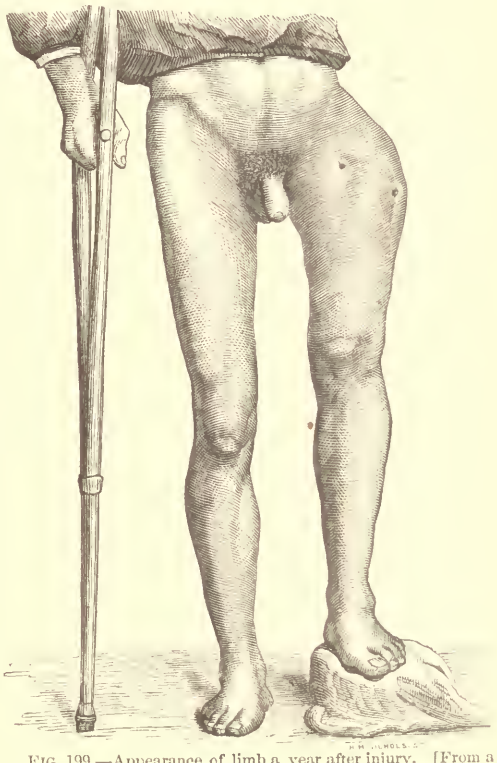

FIG. 199.—Appearance of limb a year after injury. [From a photograph.]

Consecutive bleeding was observed in three instances, two of which necessitated ligation of the femoral artery. One of the cases is detailed:[1]

CASE 481.—Private J. B. Lynn, Co. B, 83d Ohio, aged 19 years, was wounded in the right leg, at Fort Blakely, April 9, 1865, and was admitted to Sedgewick Hospital, Greenville, four days afterwards. Assistant Surgeon A. Hartsuff, U. S. A., who amputated the injured limb, furnished the following report of the operation: "The wound consisted of a longitudinal fracture of the upper portion of the tibia, involving the knee joint. The ball passed through the bone downward and emerged opposite the tendon of the gastrocnemius. On May 30th, the limb being infiltrated with serum and there being extensive bur-

[1] The other instance of ligation of the femoral artery is that of Private H. Griffith, E, 8th New York Cavalry; wounded at Antietam, September 17, 1862; shot fracture of left knee joint. Amputation at upper third of thigh, November, 1862; ulceration of branch of femoral artery, hæmorrhage; ligation of femoral at Scarpa's triangle, November 19, 1862; death November 19, 1862. *Specimens* 768 and 855, *Sect.* I, A. M. M.

rowing of pus from phlegmonous erysipelas, amputation was performed at the upper third of the thigh by the circular method. No sutures were introduced on account of the condition of the parts, thereby favoring the draining of the serum. Though the patient was debilitated and much emaciated, he finally rallied under stimulants and nourishing diet. On June 5th, hæmorrhage occurred, amounting to over twenty ounces, when the femoral artery was immediately cut down upon, exposed in its continuity, and ligated about an inch above the face of the stump. Death occurred two days later, from exhaustion. The ligatures were found to have ulcerated through, the arteries being patulous and showing no attempt at closing."

TABLE XXXVIII.

Summary of Fifty-five Cases of Secondary Amputation in the Upper Third of the Femur for Shot Fracture.

[Recoveries, 1—30; deaths, 31—55.]

No.	Name, Military Description, and Age.	Dates.	Operations, Operators, Result.
1	Babson, C. L., Pt., K, 16th Maine, age 21.	De. 13, '62, Mar. 28, 1863.	Left; circ. A. A. Surg. A. Coolidge. Disch'd Oct. 16, 1863.
2	Basim, C., Pt., H, 8th Penn. Reserves, age 20.	Sept. 17, Dec. —, 1862.	Right. (Sept. 17, amp. leg; gang.) Drs. Jones, Stewart, and Thompson, Strattonville, Pa. Disch'd Dec. 6, 1862.
3	Bates, J. A., Capt., D, 12th New York.	Je. 27, '62, Jan. 24, 1864.	Right; circ. Surg. A. B. Mott, U. S. V. Feb. 6, hæm. recurred. Disch'd June 12, 1864.
4	Brinker J. H., Pt., E, 11th Penn., age 23.	De. 13, '62, Mar. 21, 1864.	Right (necrosis); flap. A. A. Surg. J. H. Thompson. Discharged March 3, 1865.
5	Crede, F., Pt., C, 178th New York, age 29.	April 9, Sept. 1, 1864.	Left; ant. post. flap. Surg. J. F. Randolph, U. S. A. Discharged Oct. 21, 1865.
6	*Drew, D.*, Pt., F, Phillips' Legion.	Au. 31, '62, Ja. 31, '63.	Left. Surg. — Owens, C. S. A. Recovery.
7	*Ellett, L.*, Pt., D, 16th Mississippi, age 20.	May 3, J'ne 6, '63.	——; circular. Recovery.
8	Glenn, J., Pt., K, 42d Pennsylvania.	De. 20, '61, Fe. 9, '62.	Right; circ. Surg. E. Shippen, U. S. V. Disch'd May 16, 1862.
9	Hall, S. C., Pt., F, 3d Indiana Cavalry.	Nov. 8, '63, April 13, 1864.	Right. (Exc. femur.) Surg. T. R. Crosby, U. S. V. Disch'd July 8, 1864.
10	Hammill, J., Serg't, D, 8th New Jersey.	May 3, June 16, 1863.	Right; circ. Surg. D. W. Bliss, U. S. V. Disch'd May 5, 1864. *Spec.* 1263.
11	Hartigan, M., Pt., H, 108th New York, age 18.	Sept. 17, Oc. 30, '62.	Left (synovitis); flap. A. A. Surg. C. J. Morton. Disch'd May 19, 1863. *Spec.* 262.
12	Henry, D. P., Pt., H, 11th Missouri, age 29.	Oct. 4, De. 26, '62.	Left. Discharged April 7, 1863.
13	Hervey, R., Pt., C, 82d Pennsylvania, age 20.	July 1, Aug. 1, 1862.	Left; flap. Surg. C. Page, U. S. A. Aug. 12, lig. femoral artery. March 28, '63, gen. hæm.; gang.; pyæmia. Disch'd Oct. 6, 1863.
14	Jarvis, H., Pt., K, 55th Massachusetts.	No. 30, '64, M'y 8, '67.	Right (disch'd Nov. 25, '65); flap. Dr. A. R. Carey. Recovery.
15	*Johnson C.*, Pt., H, 13th Louisiana.	Oc. 20, '63, J'y 14, '64.	——. Surg. — Friend, C. S. A. Recovery.
16	Jones, J. M., Pt., K, 21st Indiana, age 29.	Au. 5, '62, Jan. 23, 1869.	Right (necrosis; exfol.); ant. post. flap. Disch'd April 15, 1863. Surgeon D. W. Bliss, U. S. V. Recovery. *Spec.* 5558.
17	Knox, A. G., Pt., D, 18th New York, age 19.	Sept. 14. De. 12, '62.	Right; flap. Act. Ass't Surg. A. North. Disch'd Jan. 14, 1863.
18	Kuhns, W. H., Serg't, C, 102d Pennsylvania.	May 31, J'y 2, '62.	Right; flap. Discharged July 6, 1862.
19	*Loggins, W.*, Pt., E, 6th Texas Cavalry, age 21.	De. 21, '62, Feb. –, '63.	Right; circular. To Prison Nov. 9, 1863.
20	Morris, T. H., Pt., D, 6th Iowa, age 21.	Ap. 6, '62, Ap. 5, '67.	Right (discharged April 29, 1863. Suppuration, erysip., etc.); flap. Dr. H. S. Sawyer, Centerville, Iowa. 1870, stump healthy.
21	*Oakes, E.*, Pt., E, 14th Louisiana.	May 5, J'y 9, '62.	Right thigh. Recovery.
22	*Page, W. A.*, Pt., F, 21st North Carolina.	May 25, J'y 19, '62.	Left. Surg. — Brundidge, C. S. A. Recovery.
23	Perry, H. D., Pt., H, 19th Mass., age 17.	De. 13, '62, May 29, 1866.	Left. (Portion of ball and spiculæ removed; necrosis; deformity. Disch'd Sept. —, 1863.)
24	Plack, J. H., Corp'l, F, 34th Ohio.	De. 29, 61, Feb. –, '62.	Right. Surg. W. R. S. Clark, 34th Ohio. Disch'd May 24, 1862.
25	Rufus, C., Pt., 1st Col'd Artillery, age 25.	Jan. —, M'h 1, '64.	Left; flap. Surg. D. O. McCord, 9th La. C. T. Duty Feb. 10, '66.
26	Sears, J., Pt., E, 43d N. York, age 26.	July 1, Aug. 19, 1862.	Left (sloughing); flap. Surg. A. B. Shipman, U. S. V. Disch'd Sept. 14, 1864.
27	Shanen, J., Pt., E, 170th New York, age 46.	May 24, Oct. 1, '64.	Right; lateral flap. Surg. T. R. Crosby, U. S. V. Oct. 6, hæm.; lig. fem. art. Disc'h Aug. 15, '65.
28	Sherwood, G. A., Corp'l, G, 14th Indiana.	Sept. 17, Oc. 25, '62.	Left; flap. A. A. Surg. W. M. Hines. Disch'd Dec. 13, 1862.
29	Smith, P., Pt., F, 5th Infantry.	Feb. 22, M'y 4, '62.	Right; flap. A. Surg. B. Norris, U. S. A. Disch'd July 13, 1862.
30	Walsh, H., Landsman, U. S. S. Mendota, age 18.	July 16. Sept. 2, 1864.	Left; circ. Surg. W. Johnson, U. S. N. Disch'd April 11, 1865. *Spec.* 3213.
31	Bosse, E., Pt., F, 8th New York.	June 8, J'y 15, '62.	Left; lat. flap; hectic fev.; diarr. Died Sept. 1, '62; pyæm. Autop.
32	*Bradley, J.*, Pt., D, 25th North Carolina.	—— —, J'y 18, '62.	——. (Necrosis; gang.) Died few minutes after operation.
33	Byram, W., Pt., K, 3d Michigan Cav., age 23.	May 6, Aug. 7, 1864.	Right. (July 30, bone rem'd.) Surg. A. Hammer, U. S. V. Died August 10, 1864.
34	Collar, C., Pt., F, 45th Illinois, age 20.	Feb. 14, M'y 1, '64.	Right. (March 12, exc.) Surg. W. J. McKim, 15th Ill. Died May 9, 1864; shock.
35	Cowperthwaite, C., Corp., L, 1st N. J. Cav., age 22.	Oc. 12, '63, Jan. 5, '64.	Left; circ. A. Surg. A. Ingram, U. S. A. Died Jan. 6, '64; shock.
36	Cunningham, O. H., Pt., I, 82d Ohio, age 35.	May 2, '63, May 3, '64.	Right (ball ext.; erysip.); double flap. Surg. D. W. Bliss, U. S. V. Died June 5, '64. *Spec.* 2254.
37	Ellithorpe, P. G., Pt., I, 1st Penn., age 20.	July 2, Au. 10, '63.	Left; slough.; diar.; hæm.; tourn. Died Oct. 5, 1863; exhaustion.
38	Farr, F. B., Serg't, H, 2d New York H'vy Artillery, age 22.	April 7, Aug. 2, 1865.	Right (frag's bone and two pieces of ball rem'd; hæm.); ant. post. flap. A. A. Surg. B. B. Miles. Died same day. *Specs.* 1565, 2797.
39	Goodsell, A., Pt., H, 1st Colorado Cavalry.	No. 29, '64, Ja. 14, '65.	Right. Died one hour after operation.
40	Griffith, H., Pt., E, 8th New York Cavalry.	Sept. 17, Nov. —, 1862.	Left. Surg. H. S. Hewit, U. S. V. Hæm; Nov. 19, lig. fem. artery. Died Nov. 19, '62. *Specs.* 768, 855.
41	*Hughes, S. D.*, Pt., D, 14th South Carolina, age 38.	J'y 2, '63, Feb. 6, 1864.	Right; circ. Surg. A. Heger, U. S. A. Died Feb. 16, 1864; pyæmia. Autopsy.
42	Humma, L., Pt., H, 88th Pennsylvania.	Au. 30, '62, Jan. 20, 1863.	Left. (Erysipelas.) Surg. D. P. Smith, U. S. V. Died Jan. 20, 1863. *Spec.* 1186.
43	Icanberry, A., Pt., K, 6th Kansas Cav., age 18.	Nov. —, De. 22, '63.	Left thigh. Died December 30, 1863.
44	Ivery, N., Pt., B, 12th Michigan.	April 7, M'y 15, '62.	——. Died three hours after operation; exhaustion.
45	Kreps, J., Pt., C, 29th Iowa, age 16.	April 30, July 9, 1864.	Right (carious); ant. post. flap. A. Surg. E. A. Clark, U. S. V. Died Aug. 8, 1864; pyæmia.
46	Luxford, G., Pt., A, 50th Illinois, age 16.	Oct. 5, Nov. 20, 1864.	Right (necrosis); circ. Surg. S. S. Boyd, 84th Ind. Died Nov. 28, 1864; exhaustion.
47	Lynn, J. B., Pt., B, 83d Ohio, age 19.	April 9, May 30, 1865.	Right (erysip.); circ. A. Surg. A. Hartsuff, U. S. A. Hæm.; lig. fem. art. Died June 7, 1865.
48	O'Brien, D., Pt., H, 69th New York.	Sept. 17, Dec. 5, 1862.	Right; flap. Surg. H. S. Hewit, U. S. V. Died Dec. 16, 1862; exh'n. Autop. *Specs.* 755, 1101.
49	[1] Peaslee, A., Pt., I, 23d Mass., age 23.	June 27, Au. 14, '62.	Left. Dr. — Halsted. Died Aug. 15, 1862.
50	[2] Pool, J., Pt., H, 119th Penn., age 23.	No. 7, '63, April 18, 1864.	Left (frag's bone rem'd); double flap. Surg. J. A. Lidell, U. S. V. Sloughing. Died April 26, '64; exhaustion. *Spec.* 2229.
51	Riley, P., Pt., A, 10th New York, age 24.	J'e 3, '64, Ap. –, '66.	Left. (Deformity; fistulous passage.) Died May 7, '66; pyæm.
52	Seville, W. S., Pt., G, 1st Delaware.	Sept. 17, 1862, Jan. 5, 1863.	Right (deformity); flap, skin; circ. muscles. A. Surg. R. F. Weir, U. S. A. Died Jan. 10, 1863; shock. *Spec.* 3866.
53	*Shoffeitt, J. H.*, Pt., E, 13th Alabama, age 20.	July 3, Nov. 1, 1863.	Right (thrombo.; gang.; erysip.); circ. Surg. A. Heger, U. S. A. Died Nov. 2, 1863. Autopsy.
54	*Sims, T. R.*, Pt., F, 12th Tenn. Cav., age 20.	Sept. 22, Nov. 7, 1864.	Right; ant. post. flap. A. A. Surg. M. L. Herr. Died November 22, 1864; exhaustion.
55	Smith, C. A., Pt., C, 51st Illinois, age 41.	Nov. 30, 1864, Jan. 8, '65.	Right; circ. Surg. J. R. Ludlow, U. S. V. Died Jan. 8, '65; exh'n.

[1] STURGIS (F. D.), *Reports of Hospitals*, in *American Medical Times*, 1862, Vol. V, p. 174.

[2] LIDELL (J. A.), *On the Secondary Traumatic Lesions of Bone, etc.*, in *U. S. Sanitary Commission Memoirs*, 1870, Surgical Volume I, p. 414.

In three of the fifty-five cases enumerated in the foregoing table the seat of injury was in the upper third; in twelve, in the middle third; in eleven, in the lower third; in seven, in the femur without precise indication; in fifteen, in the knee joint; and in seven cases in the leg.

Secondary Amputations in the Middle Third of the Femur.—The one hundred and sixty-eight cases of this group comprise one hundred and two recoveries and sixty-six deaths, a mortality of only 39.2 per cent., or 6.2 per cent. less than the mortality of the secondary upper third amputations. Twenty-seven of the one hundred and sixty-eight operations were practised on Confederate, and one hundred and forty-one on Union soldiers. Of one hundred and sixty-two cases in which this point was indicated, the injuries were on the left in eighty-nine and on the right side in seventy-three instances.

Cases of Recovery after Secondary Amputation in the Middle Third of the Femur.—One hundred and two cases belong to this category. The injuries were caused by shell in one, by solid shot in two, by canister shot in one, and by small projectiles in ninety-eight cases. Nine patients were Confederate, and ninety-three Union soldiers; five of the latter have died since the termination of the War, while eighty-eight remained pensioners in January, 1880.

Case 482.—Private Andrew Van Vorst, Co. A, 134th New York, age 18 years, was wounded at Gettysburg, July 1, 1863, by a conoidal ball passing through the right knee joint, causing a comminuted fracture. He was admitted into the Camp Letterman Hospital on August 21st. Acting Assistant Surgeon W. M. Welch, under whose care he was placed October 28, 1863, records: "Thigh was amputated at the middle third August 1st; the stump is healiug finely and his health is good." He was sent to Baltimore November 8th, where he remained in the Newton University Hospital until April 25, 1864, when he was sent to New York and admitted into the DeCamp Hospital. His stump had entirely healed. On October 16th, he was transferred to Albany and admitted into the Ira Harris Hospital, from whence Assistant Surgeon J. H. Armsby, U. S. V., reported his recovery and discharge from service August 11, 1865, and contributed a plaster cast of the stump (A. M. M., *Spec.* No. 417, *Sect.* I, *Cat.* 1866, p. 554), a drawing of which is given in the wood-cut (Fig. 200). His pension was paid January 4, 1880.

Fig. 200.—Appearance of stump three months after amputation. *Spec.* 417.

Case 483.—Private J. Scheuermann, Co. K, 9th Ohio, aged 28 years, was wounded at Chickamauga, September 19, 1863, and admitted to the field hospital of the 3d division, Fourteenth Corps, where Surgeon J. R. Arter, 31st Ohio, noted: "Shot fracture of right thigh." Several weeks after the reception of the injury the wounded man was transferred to hospital at Chattanooga, subsequently to Bridgeport, and, on December 11th, to Murfreesboro', whence Assistant Surgeon G. V. Woolen, 27th Indiana, reported the case as follows: "The ball entered the limb anteriorly, about four inches above the knee joint, passing backward and upward, fracturing the femur at the junction of the middle and lower third, and lodging in the gluteus maximus muscle. The fracture was oblique and lateral, and remained ununited, the limb being shortened about three inches. The ends of the bone were necrosed, and suppuration profuse. About three months after his admission the patient had an attack of erysipelas, which subsided, but left the limb in an œdematous condition. At this time his constitutional condition had become very feeble, his appetite was wanting, and he was unable to sleep from pain in the wound, which was discharging considerable quantities of ichorous pus. It was then deemed proper to remove the limb, and amputation was performed by Assistant Surgeon J. E. Link, 21st Illinois, on March 18, 1864. The operation was done by the circular method at the junction of the upper and middle thirds, but little hæmorrhage taking place. The ligatures were applied and chloroform was used. The patient rallied well from the operation, and immediately began to improve in general health. In the course of a month the stump had closed." The patient was subsequently transferred to Washington Park Hospital, Cincinnati, mustered out of service July 14, 1864, and supplied with an artificial limb of Dr. Bly's pattern one year afterwards. He is a pensioner, and was paid September 4, 1879. The amputated femur was contributed by Surgeon I. Moses, U. S. V., and is represented in the cut (Fig. 201), showing a moderate deposit of callus but no union of the fracture.

Fig. 201.—Shot fracture of middle third of right femur. *Spec.* 2802.

Case 484.—Private F. Luck, Co. C, 21st Wisconsin, aged 21 years, was wounded in the right knee, at Chaplin Hills, October 8, 1862. He was admitted to hospital No. 7, Perryville, and discharged from service February 15, 1863, Surgeon J. G. Hatchett, U. S. V., certifying to "complete destruction of the use of the knee," as resulting from the injury. On the 2d day of the following December the man entered Harvey Hospital, at Madison, whence Surgeon H. Culbertson, U. S. V., contributed the pathological specimen (No. 2074, *Surgical Section*, A. M. M.), with the following report: "This soldier received a penetrating wound of the knee joint, and was unfortunately discharged at the breaking up of the Perryville Hospital, when the knee was still running and not in

progress of cure. The injury was caused by a minié ball, which entered posteriorly and to the inside of the tuberosity of the external condyle of the femur, passed obliquely forward and slightly inward, fracturing the external condyle and also the upper and outer margin of the patella, and came out opposite that point of the bone. True and false anchylosis resulted, the former between the inner condyle and head of tibia, and necrosis of the inner condyle ensued. At the time of the patient's admission the state of the parts was as follows: The joint was enlarged and the wound open over the external condyle, and some three inches higher up the thigh another opening existed, both of which discharged unhealthy pus. There was also periostitis extending up as high as the lower fourth of the femur, and the soft parts about the joint were swollen and indurated up to the middle third of the thigh. Circulation below the knee was extremely feeble, and the leg, bent upon the thigh at right angle, was extremely emaciated. The patient's constitution showed marked evidence of scrofulous diathesis. At first I determined to treat the case by resection of the joint, but on reflecting, and with the advice of Dr. E. B. Wolcott, Surgeon General of Wisconsin, I decided upon amputation as affording the best and safest means for the removal of the disease. Just before the operation, which was done on January 3, 1864, the patient fell upon the floor and broke the union between the tibia and inner condyle of femur; yet from the inflammatory exudations thrown out about the joint it was found impossible to straighten the limb, though efforts were made to effect this object while he was under the influence of chloroform. I performed the amputation at the middle third of the thigh, by the circular method, in the presence of Dr. Wolcott, Acting Assistant Surgeons J. J. Brown and J. Favill, and Medical Cadet W. B. Buckley. Nothing unfavorable occurred, and the wound healed by first intention, though the ligature applied to the femoral artery has not yet (February 7th) come away. The stump now certainly demonstrates the superiority of the circular over the flap operation of this member, being one of the most perfect in form I have yet seen. This case illustrates the efforts of nature to diminish the capacity of the joint by anchylosis and the exudation into it of plastic organizable material; also the fact that penetrating gunshot wounds of the knee joint will require amputation, even though nature be given fifteen months in which to effect a cure. On examination of the morbid specimen, it will be seen that the ball passed through the cancellated structure of the external condyle, entering the cavity of the joint only at two opposite points, thus inflicting upon the synovial membrane but a slight wound so far as extent is concerned. Unquestionably great inflammation must have followed the wound, as is proved by the effects observable. But nature could not have been as successful had the external condyle been broken into fragments. It was in fact a penetrating wound of a portion of the joint which inflicted great injury to it, and yet it was singularly and uncommonly local, the wound of the bone appearing as though it might have been made with a circular punch. The fact that the bones entering into the formation of the joint were injured in so limited a manner would seem to be the reason why amputation was not required long since." Dr. Culbertson appends the following remark to this history: "This case is cited not because of the amputation performed, but to illustrate the great efforts of nature in the cure of penetrating gunshot wounds of knee joints, and also her failure in the attempt." Three months after the operation the patient was well enough to proceed to Chicago for the purpose of being fitted with an artificial limb, and on May 28, 1864, he left the hospital for his home. The pensioner was paid June 4, 1879.

CASE 485.—Private E. Green, Co. K, 119th Pennsylvania, aged 35 years, was wounded in the right thigh, at Rappahannock Station, November 7, 1863, and was admitted to Armory Square Hospital, Washington, two days afterwards. Surgeon D. W. Bliss, U. S. V., furnished the following description of the injury, and of the operation which he performed: "The missile, a conical ball, entered one and a half inches above and to the right of the patella, passing across the limb, fracturing the femur in the lower third, and lodging on the inner and posterior side, nearly opposite the point of entrance. The limb was treated in a skeleton fracture-box, and water dressings were used. On November 18th, the ball was extracted. Hæmorrhage occurred on the following day, and again three days afterwards. The discharge of pus became copious about December 1st, and dry gangrene of the toes and dorsum of foot appeared. The upper fragment of the femur protruded one and a half inches, and at every effort to extend the limb so as to retract the protruding bone violent hæmorrhage ensued. The patient's system was greatly reduced, and careful attention was paid to retain his digestive powers by a rotation of stimulants and nourishing diet. A slight change in the position of the limb, on December 28th, brought on a hæmorrhage to the amount of twenty ounces in three minutes' time—evidently from the femoral artery, which was then controlled by pressure. By January 20, 1864, sloughing of the heel and dorsum of foot had commenced, and the patient's system was still so much debilitated that a decision to operate, which had been retarded as calculated to prove fatal, was now arrived at as a last chance to preserve life. On the following day the thigh was amputated at the middle third by antero-posterior flaps, four arteries being tied and but little blood lost. Ether was used as the anæsthetic. At the operation an abscess was discovered in the anterior flap extending upward for three inches, and the femoral artery was found to be destroyed in the upper part of the popliteal space, evidently by the missile. Above the point of the amputation the vessel was healthy; but no clot was found. The vessels of the leg were much constricted. The lower fragment of the femur was flexed at an angle of thirty degrees with the leg, and, by contraction of the muscles of the thigh, was pressed firmly against the wounded extremity of the femoral artery, thereby preventing fatal hæmorrhage. The flaps of the stump presented an unhealthy appearance, being much indurated and infiltrated with serum. Tincture of chloride of iron was applied to the entire surface with a view of stimulating the parts and of obtaining its hæmostatic effect upon the capillary vessels which failed to contract from cold and exposure to the air. A large tent was placed through the fourchette of the stump so as to prevent the accumulation of pus, the flaps being gently brought together and tepid water dressing applied. The patient improved daily, and was in a fair way of recovery one week after the operation." The amputated portion of the femur was contributed to the Museum by the operator, and is shown in the wood-cut (FIG. 202). The specimen shows the parts about the fracture to be dead and stripped, and its upper half to be covered with an involucrum of foliaceous callus tolerably dense posteriorly, also some periosteal deposit above the condyles. The patient subsequently entered Judiciary Square Hospital, and was discharged July 7, 1864. He was furnished with an artificial leg by B. F. Palmer, August 26, 1865, and was paid as a pensioner until September 4, 1867, since when he has not been heard from.

FIG. 202.—Shot comminution of the lower third of right femur. *Spec.* 2033.

In the next case the amputation was performed five years after the reception of the injury, owing to the continual recurrence of abscesses. The patient died eleven years after the operation, of pulmonary disease:

CASE 486.—Private Charles M. Bowen,[1] Co. A, 27th Indiana, aged 19 years, was wounded at Antietam, September 17, 1862. He was taken to Frederick and admitted to No. 1 hospital on September 24th. Acting Assistant Surgeon J. C. Shimer records the following: "A conoidal ball had entered the outer aspect of the left thigh about five inches above the knee, fractured the femur, and passed out directly opposite. Buck's apparatus was applied. On October 19th, considerable amount of callus had been thrown out, and there was some union; his appetite and general condition were good. October 23d, a deep but circumscribed abscess on the outer side of middle third of thigh was opened and evacuated. 30th, both the wounds of entrance and exit were enlarged to evacuate pus more freely. December 5th, he has improved greatly; passive motion has been employed to overcome stiffness of the knee." On March 18, 1863, he was able to walk with the aid of crutches, and the wounds had nearly healed. A slight attack of erysipelas yielded readily to treatment. May 21st, the wound took on a gangrenous condition, for which strong nitric acid was applied. On June 15th, he was transferred to Baltimore. The wounds looked healthy and his general condition was excellent. He entered the Jarvis Hospital on the 16th, and was discharged September 7, 1863. The femur had only partially united; the sciatic nerve was injured; his leg was partially and his foot entirely paralysed. He received a pension, and was employed as a clerk in the Interior Department. Owing to a recurrence of abscesses he entered the Providence Hospital, Washington, in the autumn of 1867, and, on November 11th, the limb was amputated in the middle third by Dr. D. W. Bliss, late Surgeon U. S. V. The wound healed well, and a photograph was taken at the Army Medical Museum on January 9, 1868, at which time the stump was firm and healthy. The specimen was contributed to the Museum by the operator, and is No. 4914, Surgical Section. The fragments are considerably overlapped, having undergone unusual disturbance, and the amount of callus exceeds what is necessary for complete union. On March 10, 1871, the patient was a clerk in the Pension Office; the stump was healthy but his general health poor. He died March 17, 1878, of phthisis pulmonalis.

FIG. 203.—Appearance of stump two months after amputation. [From a photograph.]

The amputation in the thigh in the one hundred and two cases of this group had been preceded by other operations in thirteen instances, viz: by amputation at the knee joint in two, by amputation in the leg and subsequent amputation at the knee in one, by ablation in the leg in six, by excision in the shaft of the femur in one, and by excision in the bones of the leg in three instances.[2]

Fatal Cases of Secondary Amputation in the Middle Third of the Femur.—The sixty-six operations of this category were practised on forty-eight Union and eighteen Confederate soldiers. Eight autopsies are recorded in this series, and twenty-five pathological specimens are preserved. Pyæmia was observed in ten, gangrene in fourteen, and erysipelas in seven cases. In nine instances copious hæmorrhages preceded the amputation, and in eleven hæmorrhages occurred after the operation.

CASE 487.—Private L. Williams, Co. C, 26th Michigan, aged 23 years, was wounded at Spottsylvania, May 12, 1864. Surgeon J. E. Pomfret, 7th New York Artillery, recorded his admission to the field hospital of the 1st division, Second Corps, with "shot wound of left knee, caused by a minié ball." Assistant Surgeon J. C. McKee, U. S. A., who contributed the pathological specimen of the case (*Cat. Surg. Sect.*, 1866, p. 343, *Spec.* 2538), reported the result of the injury as follows: "The wounded man entered Lincoln Hospital, Washington, May 30th. He was a man of nervous and irritable temperament. When admitted he suffered from much constitutional derangement, and the tissues in the neighborhood of the injured joint were much enlarged, tender, and painful. Cold-water dressings were used, and tonics and stimulants were administered. On June 13th, the parts above and below the knee joint being infiltrated with pus and discharging copiously through several openings, ampu-

[1] *Circular* No. 3, Surgeon General's Office, Washington, 1871, p. 205, CASE DLXXXV.

[2] The limb had been removed at the knee in the case of Corp'l F. Hare, B, 6th Wisconsin (TABLE XXXIX, No. 39, p. 314), and of Pt. *L. C. Young*, A, 3d Virginia (TABLE XXXIX, No. 100, p. 315). In the case of Pt. A. Bronchard, 5th New Hampshire (TABLE XXXIX, No. 11, p. 313), the fracture in the foot had been followed by excision of the 3d and 4th metatarsal bones, then by amputation in the lower third of the leg, then by amputation through the knee joint, and finally by amputation in the thigh. The patients who had undergone amputation in the leg were Corp'l H. W. Hughes, I, 133d New York (TABLE XXXIX, No. 43, p. 314); Pt. W. Stitle, A, 29th Ohio (TABLE XXXIX, No. 86, p. 314); Pt. J. Bowen, C, 42d Illinois (TABLE XXXIX, No. 8, p. 313); Pt. B. Nussbaumer, B, 67th Ohio (TABLE XXXIX, No. 67, p. 314); Corp'l G. Dewey, M, 11th Illinois Cavalry (TABLE XXXIX, No. 24, p. 314); and Lieut. J. H. Bell, D, 61st Ohio (TABLE XXXIX, No. 5, p. 313). In the case of Corp'l T. Duggan, M, 11th Illinois Cavalry (TABLE XXVII, No. 4, p. 212, *ante*, and TABLE XXXIX, No. 26, p. 314), an excision in the shaft of the femur had been performed, and excisions in the bones of the leg in the cases of Pt. S. Montgomery, I, 139th Pennsylvania (TABLE XXXIX, No. 63, p. 314); Pt. W. Stockdale, D, 48th Indiana (TABLE XXXIX, No. 87, p. 314); and Pt. C. Murphy, D, 69th New York (TABLE XXXIX, No. 65, p. 314).

tation was decided upon, and performed at the middle third of the femur by Acting Assistant Surgeon A. Ansell, as the only chance of saving the patient's life. On examining the injured parts after the operation the missile was found to have passed through the joint, comminuting the patella and knocking away the head of the tibia on its inner side. The subsequent treatment consisted of cold-water dressings to the stump and the administration of six ounces of brandy per diem; one grain of sulphate of morphia was given at bedtime after the operation. Iron and quinine were prescribed some days afterwards. The patient did exceedingly well, and the stump healed kindly, the cicatrix forming perfectly with the exception of one small opening, which served as an outlet for a small abscess about the size of a pigeon's egg. Hæmorrhage took place from this part of the stump on July 18th, when the tourniquet was applied to the femoral artery, which had the effect of arresting the flow of blood. A plug of lint saturated with a solution of persulphate of iron was then introduced into the wound and the tourniquet removed. Hæmorrhage occurred again on the morning of the following day, when, on consultation, it was decided to open the stump and ligate the bleeding vessel. This was also done by Dr. Ansell, who tied the femoral as well as two muscular arteries, which had been opened by the incision. The operation was performed at 11.30 A. M., and the patient died at 6 P. M. on the same day, July 19, 1864, not having rallied, and having lost altogether about twenty ounces of blood. The interior of the stump was found to be perfectly healthy, with the exception of the small abscess before mentioned." The specimen consists of the bones of the amputated knee, showing the articular surface to be carious, and a longitudinal incomplete fracture extending between the condyles two and a half inches up the femur, on the shaft of which two trivial points of periosteal thickening appear. The stump of the femur, showing a partially detached sequestrum and handsome but useless foliaceous deposit, together with a wet preparation of the ligated femoral artery, were also contributed to the Museum by Acting Assistant Surgeon H. M. Dean, and constitute specimens 2882 and 2883 of the Surgical Section.

CASE 488.—Captain *E. W. Capps*, Co. C, 15th Virginia Cavalry, aged 35 years, was wounded at Brandy Station, Virginia, October 11, 1863. He was admitted, on October 21st, into Lincoln Hospital, Washington. Assistant Surgeon H. Allen, U. S. A., reported:[1] "A conoidal ball entered the right leg, from without inward, about one and a half inches below the patella, passed through the anterior portion of the leg, fractured the spine of the tibia, and emerged on the inner side of the limb. On admission a bandage was found applied tightly to the affected part. Upon its removal the joint was discovered to be greatly swollen from effusion, and the wounds presented an inflamed appearance. Cold-water dressings were applied. No constitutional symptoms were present. After the effusion in the joint had subsided a thorough examination of the wound was made. The head of the tibia was found pierced by the ball. No stellation existed, nor was the joint involved. A seton of tow was thrust through the wound and withdrawn, bringing away several small fragments of bone. On October 21st, a small abscess was opened in the popliteal space. The patient, from this time, did remarkably well, and all thought him to be out of danger. On January 26, 1864, however, when he was walking, with the assistance of crutches, from one ward to another, he stumbled, and, in order to preserve his balance, bore his weight upon the injured limb. The following day an erysipelatous inflammation set in about the joint, which became enormously swollen. He was restless and uneasy, his skin hot and dry, tongue coated with a thick whitish fur; he had severe pain in the head; pulse 140; anorexia and constipation present. On January 29th, a sense of decided fluctuation was felt in the joint, and it was thought at the time that pyarthrosis of the knee joint was present. He had little or no fever. His pulse averaged 120 beats per minute, soft, compressible. Face very pale, mind clear. The swelling in the course of a week had gone down completely from the limb below and above the joint; but around the seat of injury and joint a dull purplish red color lingered. By judicious pressure pus could readily be made to exude through the internal wound. Pus had burrowed a very little distance in the parts connected with the popliteal abscess above mentioned. No sinus of any extent existed. It was now evident that the case was one demanding amputation, and, the patient's condition being favorable, the circular operation was performed by Assistant Surgeon J. C. McKee, U. S. A., in charge, on February 8th. The joint, which gave evidence of the presence of pus of long standing, the cartilages being denuded and partially destroyed, was sent to the Army Medical Museum (*Specimen* 2036 of the Surgical Section). The patient did well until February 12th, when he had a severe chill which lasted forty minutes. This was followed by a profuse diaphoresis. The skin became cold and clammy, the pulse 120 and feeble. On the following day he had another chill, and, on the 15th, two more, one in the morning at six, the other at four o'clock in the afternoon. Another exacerbation occurred on the morning of the 16th. In other respects the constitutional symptoms of what was evident to all to be pyæmia were remarkably slight. His tongue remained clean. His appetite continued the same. There was no vomiting, no fever of any consequence followed the chills; his pulse varied from 120 to 140, rapid and weak. His appearance at this time was that of a man who was suffering from a severe hæmorrhage; his anæmic condition was startling; his sclerotica were pearly white, his lips and gums pale, his finger nails blue. He had a slight cough, though no expectoration. His most distressing symptom was the colliquative sweatings, which came on during the night, and which were not apparently connected with the chills. The limb looked well, and there was no unusual amount of pain in it. The flaps were granulating finely. On February 18th the sixth chill took place, and, on the next day, the seventh, followed by vomiting. He now rapidly sank, and died on February 20th, at four o'clock A. M. Autopsy: Rigor mortis marked. Adipose tissue abundant. Limb much swollen and of a tallow color. Upon dissecting out the vessels the tissues of the thigh were found greatly indurated, especially along the course of the Hunterian tract. The interior of the femoral vein was filled with a solid black clot, which was firmly adherent to the walls of the vein. No disintegration noticed. The lower third of the vessel, that which had lain in contact with the suppurating surface of the stump, was stained by a purulent fluid for about two inches from the patulous opening. A curious appearance was observed in one of the small branches of the profunda vein in the upper third of the thigh. It presented the same general aspect seen in the patulous end of the femoral, and was filled with pseudo-pus." A drawing (made by Hospital Steward E. Stauch, and copied in PLATE XXIII, opposite) of the upper two-thirds of the femur, removed at the *post-mortem*, shows the separation of the periosteum in osteomyelitis. Upon a longitudinal section of the femur (PLATE XLIX, opposite p. 314) the medulla throughout was found to be of a grayish-yellow color, which was more intense at the region of the trochanter than elsewhere. Numerous small abscesses, more or less elliptical, were arranged lineally

[1] A condensed abstract of this case was published by Dr. ALLEN in the *American Journal of Medical Sciences*, 1865, Vol. XLIX, p. 39, in connection with his *Remarks on the Pathological Anatomy of Osteomyelitis, with Cases.*

down the central portion of the medulla. The bone was not thickened or vascular. The periosteum, however, was inflamed, and, at the lower two-thirds of the specimen, was readily stripped from the bone, where it presented the appearance of having been pulled away from the femur by the fibres of the muscles inserted upon it.

CASE 489.—Lieutenant-Colonel G. F. Lamon, 32d New York, was wounded in the left thigh, at Crampton's Pass, September 14, 1862. He was conveyed to hospital at Burkittsville, whence Assistant Surgeon H. A. DuBois, U. S. A., contributed the pathological specimen (*Cat. Surg. Sect.*, 1866, p. 287, *Spec.* 792), with the following history: "The injury was caused by a minié ball, producing a compound comminuted fracture of the femur in the lower third, which was treated with Smith's anterior splints. The wound suppurated freely, and at the end of the second week all inflammatory symptoms had subsided. There was no pain from the first. On November 3d, I found recorded in the case book: 'A speedy recovery beyond doubt; shortening about an inch.' Several days after this bleeding took place, which was thought to be from the femoral. The artery was then compressed with the finger at Poupart's ligament for about fifty hours. Up to the time of the hæmorrhage the patient had an excellent appetite; but he now sank speedily and did not rally for two days, though strongly stimulated and receiving the most nourishing diet. On November 9th, the thigh was removed by the flap method by Surgeon L. W. Oakley, 2d New Jersey, it being decided inexpedient to secure the artery. The patient did not completely recover from the shock. Eight hours after the operation he commenced to sink with great rapidity, and three hours later he died. The specimen illustrates well the nature of a wound in the bone caused by a minié ball, also the amount of union after two months' rest. On examining the removed limb it was found that the ball had brushed the artery, and that the artery had ulcerated to the extent of about one-third of an inch. During the last month the case was under the care of Surgeon Oakley." The pathological specimen consists of the amputated lower half of the femur, and exhibits shortening, with slight union and some deformity, the fractured extremities being necrosed and spanned at points by new bone.

Of the sixty fatal secondary operations in the middle third of the thigh, ten had been preceded by other major operations, viz: one by a primary amputation in the middle third of the opposite thigh, two by exarticulations at the knee joint, and seven by amputations in the leg.[1] In one instance the amputation in the thigh was followed by exarticulation at the hip joint.[2]

TABLE XXXIX.

Summary of One Hundred and Sixty-eight Cases of Secondary Amputation in the Middle Third of the Femur for Shot Fracture.

[Recoveries, 1—102; Deaths, 103—168.]

No.	NAME, MILITARY DESCRIPTION, AND AGE.	DATES.	OPERATIONS, OPERATORS, RESULT.	No.	NAME, MILITARY DESCRIPTION, AND AGE.	DATES.	OPERATIONS, OPERATORS, RESULT.

				21	Crispin, J. A., Pt., A, 3d New Mexico.	Feb. 21, Mar.–,'62.	Right. A. Surg. B. Norris, U. S. A. Disch'd Feb. 28, 1863.
				22	Culley, J., Pt., K, 7th Missouri, age 23.	May 18, 1863, Ap.10,'64.	Right (caries; erysip.); circ. A. Surg. H. R. Tilton, U. S. A. Disc. July 14, 1864. *Spec.* 2677.
				23	Daniels, S., Pt., K, 1st Iowa.	Aug. 10, Oc.—,'61.	Right; circ. Dr. J. P. Coulter, Marion, Iowa. Discharged.

[1] Primary amputation in the middle third of the opposite thigh had been performed in the case of Pt. S. Baguley, B, 5th New Hampshire (TABLE XXXI, No. 703, p. 235, *ante*, and TABLE XXXIX, No. 105, p. 315). In the cases of Pt. George T. Skilton, I, 36th Wisconsin, and Pt. J. M. Storey, H, 37th Wisconsin (TABLE XXXIX, No. 156, p. 316, and No. 157, p. 316), exarticulation at the knee joint had been performed prior to the amputation in the high; and amputation in the leg had preceded thigh amputation in the cases of Corp'l H. G. Brown, B, 37th Wisconsin; Pt. G. Christiana, A, 120th New York; Pt. W. L. Hindman, E, 155th Pennsylvania; Pt. H. Linn, A, 6th Pennsylvania Reserves; Pt. *L. Winters*, K, 50th Georgia; Pt. *J. F. Drain*, A, 53d Virginia; and Pt. A. C. Frost, C, 15th Massachusetts (TABLE XXXIX, Cases Nos. 108, 112, 125, 137, 166, 116, and 122).

[2] Case of Lieut. C. H. Hawkins, C, 4th New York Calvary (CASE 337, p. 158, and No. 8 of TABLE XVIII, p. 159, *ante*, and No. 124 of TABLE XXXIX, p. 315).

No.	Name, Military Description, and Age.	Dates.	Operations, Operators, Result.
24	Dewey, G., Pt., D, 51st New York.	De.13,'62, Jan.–,'63.	Left (Dec. 14, amp. leg; 28, re-amp. leg; slough.); double flap. A. A. Surg. W. V. White. Disc. Oct. 23, 1863.
25	[1]Draper, L. G., Lieut., F, 75th N. Y., age 27.	Oc.19,'64, M'y 2,'67.	Left. (M. O. Feb. 15,'66, deformity of limb.) Dr. M. D. Bennedict, late Surgeon 75th N. Y.
26	Duggan, T., Corp'l, M, 11th Illinois Cavalry.	De.18,'62, J'y 5,'66.	Right (disch'd April 7,'65); flap. Surg. E. Andrews, late 1st Ill. Light Artillery.
27	Durkee, E. W., Pt., G, 18th Wisconsin.	April 6, M'y20,'62.	Right; circ. Disch'd July 16, 1862.
28	Dwyer, J., Pt., G, 69th New York, age 33.	Sept. 17, Oc.20,'62.	Right. Disch'd April 27, 1863. Died April 9,'70; consumption. *Spec.* 756.
29	Eastman, W., Pt., I, 114th New York, age 35.	Oct. 19, No.29,'64.	Right; ant. post. flap. Surg. T. Sim, U. S. V. Disch'd April 10, 1865. *Spec.* 3474.
30	Ekstrand, J. H., Lieut., H, 13th Col'd Troops, age 33.	Aug. 30, 1864, July 17, 1868.	Left. (Nov. 24,'63, shell injury of left tibia. Disch'd Jan. 12, '65. 1868, constant pain in site of first wound; cancerous tumors inv. entire knee joint.) Recov'y. *Specs.* 5479, 5480.
31	English, J., Pt., D, 23d Ohio.	Sept. 17, Oc.23,'62.	Right; flap. A. Surg. A. Mass, 100th Penn. Disch'd Mar. 6,'63.

The seat of fracture in the foregoing one hundred and sixty-eight cases was in the middle third of the femur in seven; in the lower third in twenty-three; in the femur, precise seat not indicated, in twelve; in the knee joint, in sixty-eight; in the bones of the leg, in forty-eight; and in the ankle joint or foot, in ten cases.

Secondary Amputations in the Lower Third of the Femur.—Two hundred and seven operations of this group were reported. One hundred and seven were successful and one hundred proved fatal, a fatality of 48.3 per cent.

Successful Cases of Secondary Amputation in the Lower Third of the Femur.—Fourteen of the one hundred and seven successful secondary operations were practised on Union and ninety-three on Confederate soldiers. Eighty-nine of the former were pensioned, but seven have died since the close of the War. The side of operation was not indicated in seven instances; in forty-four the right, and in fifty-six the left side was implicated. Major operations had preceded the amputation in the thigh in thirty-one cases, viz: amputation at the knee joint in four, in the leg in twenty; excision in the bones of the leg in six, and amputation of the opposite leg in one instance.[1]

In the following instance the amputation was performed by the subperiosteal flap, advocated by Assistant Surgeon George M. McGill, U. S. A.

Case 490.—J. H. Allison, a farrier of Co. I, 21st Pennsylvania Cavalry, aged 19 years, was wounded in the left thigh, at Amelia Court House, April 5, 1865. From a field hospital he passed to the Cavalry Corps Hospital at City Point, thence to Annapolis, and afterwards to Baltimore, where he entered Jarvis Hospital, and subsequently, on July 24th, Hicks Hospital. Assistant Surgeon G. M. McGill, U. S. A., in charge of the latter, reported the following history: "The wound was caused by a minié ball, which entered the inner aspect of the lower third of the thigh and made its exit posteriorly, having passed downward, outward, and backward behind the femur, and clipped a piece from the posterior surface of the bone. The femoral artery was cut by the bullet, and profuse primary hæmorrhage occurred on the field, followed by a secondary attack on May 19th, and two recurrences since. Each secondary hæmorrhage ceased spontaneously and did not amount to more than a teacupful. About

[1] The four cases in which the amputation in the thigh was preceded by exarticulation at the knee are: Pt. J. M. Brooks, A, 17th Pennsylvania Cavalry (Table XL, No. 14, page 320); Pt. H. Desmond, I, 28th Massachusetts (Table XL, No. 25, p. 320); Pt. C. H. Rist, A, 36th Wisconsin (Table XL, No. 82, p. 321); and Pt. H. Sholes, D, 26th New York (Table XL, No. 84, p. 321). Antecedent amputations in the leg had been performed in the following cases, enumerated in Table XL: Pt. D. M. Fletcher, 10th Indiana Battery (No. 36, p. 320); Pt. G. McIntire, I, 7th Maine (No. 61, p. 320); Pt. J. Morrin, G, 126th New York (No. 69, p. 321); Pt. J. B. Bronson, I, 14th Ohio (No. 13, p. 320); Lieut. M. A. Cobb, A, 23d Alabama (No. 20, p. 320); Pt. E. Crawford, F, 105th Ohio (No. 23, p. 320); Pt. H. S. Dickens, H, 126th New York (No. 26, p. 320); Pt. W. F. Dudley, F, 1st Maine Cavalry (No. 28, p. 320); Corp'l D. C. Eaton, H, 5th New Hampshire (No. 31, p. 320); Pt. H. Hadlow, H, 81st New York (No. 42, p. 320); Pt. F. Hoffman, H, 2d Pennsylvania Heavy Artillery (No. 47, p. 320); Pt. I. M. Welsh, B, 8th Maine (No. 101, p. 321); Pt. B. Thompson, C, 28th Pennsylvania (No. 93, p. 321); Pt. W. Bacon, I, 7th Maine (No. 4, p. 320); Corp'l A. Bisbee, B, 7th Maine (No. 9, p. 320); Corp'l J. Duran, C, 17th Maine (No. 29, p. 320); Pt. W. H. Miller, I, 72d Pennsylvania (No. 67, p. 321); Pt. L. N. Kimball, H, 22d Massachusetts (No. 53, p. 320); Pt. J. Kerrin, G, 19th Infantry (No. 52, p. 320); and Pt. H. Pust, K, 104th Illinois (No. 78, p. 321). Excision in the bones of the leg had been performed in the cases of: Pt. J. A. Angell, D, 1st Wisconsin Cavalry (No. 2, p. 320); Pt. W. H. Burdick, B, 82d Pennsylvania (No. 17, p. 320); Corp'l T. Odell, H, 5th Michigan (No. 73, p. 321); Pt. J. Fergus, A, 70th Indiana (No. 34, p. 320); Serg't J. Lowth, M, 4th Wisconsin Cavalry (No. 57, p. 320); and Pt. E. A. Bennett, F, 44th New York (No. 7, p. 320). In the case of Pt. H. Brown (No. 15, p. 320), K, 22d Colored Troops, the opposite leg had been previously removed.

PLATE LXXII.—INVOLUCRA OF BONES OF THE LEG.

Fig 1. Private Oliver Payne,
D. 28 U.S. Colored Troops
Specimen 4740, A.M.M.

Fig. 2. Private W Miller
I. 72 Pennsylvania Vols.
Specimen 4172, A.M.M.

April 20th, the wound was attacked with gangrene. The knee joint at first, and at different periods since, became severely inflamed, and was opened eight times, discharging a serous purulent fluid on each occasion. The leg became bent at right angle with the thigh and firmly anchylosed, and several attempts were made to straighten the limb by means of anterior splints, which, however, gave the patient great pain, and were followed on each occasion by erysipelas. One attack of this disease supervened about December 13th, leaving the limb in a flabby and œdematous condition, and with several indolent ulcers, which obstinately refused to heal and were a source of great anxiety and annoyance to the patient. On February 16, 1866, the limb being found in a sloughing condition and the patient seeming to sink gradually, being very nervous, sallow, and anæmic, and his pulse very weak, quick, and irritable, Acting Assistant Surgeon H. McElderry amputated the leg by my direction. The operation was performed in the lower third of the femur through the diaphysis, by forming an ample anterior flap and a short and somewhat thick posterior one, and raising a very long and wide periosteum flap. The periosteum flap was raised with the greatest ease, and, after the operation was completed, was folded over every part of the cut surface of the bone. Great prostration followed the operation, from which the patient reacted rather slowly. He was kept under the influence of morphia the first several days. The bandages were removed and the stump dressed for the first time on the third day. Fever and attacks of vomiting appeared on February 19th, but after the next day the patient improved steadily and speedily. The last ligatures came away on February 24th. During the progress of his cure his blood presented the remarkable phenomenon of a change of the white corpuscles into red. At his own request the patient was discharged from service March 20, 1866, at which time he was able to sit in a chair all day, the stump being perfectly well with the exception of a surface granulation in the cicatrix. The end of the bone in this case was beautifully rounded." Dr. McGill[1] further reported that an examination of the amputated limb fully corroborated the previous diagnosis of extensive fatty degeneration, and contributed two specimens of the case, one of which, embracing the amputated femur and upper portion of tibia, is shown in the cut (FIG. 205). The other specimen consists of a ligamentous preparation of the tarsus and metatarsus and lower portion of the bones of the leg, and shows anchylosis of the ankle joint as well as a transverse fracture in the astragalus, believed to have been inflicted after the operation. (*Cat. Surg. Sect.*, 1866, p. 440, *Spec.* 483.) A cast of the stump, made four weeks after the amputation, was also contributed by the same donor, and constitutes Specimen 403 of the Surgical Section (FIG. 204). The patient, after being discharged, was admitted on the Pension Rolls, and furnished with an artificial limb two years afterwards. The Muscatine, Iowa, Examining Board, on June 4, 1873, reported that "on account of contraction of the anterior muscles of the thigh, preventing the limb from being carried backward, he is unable to wear an artificial leg." This pensioner was paid June 4, 1879.

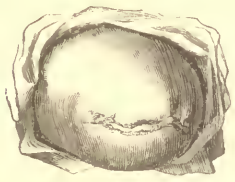

FIG. 204.—Appearance of stump of left thigh four weeks after operation. *Spec.* 403.

FIG. 205.—Upper portion of left tibia and fibula and lower portion of femur. *Spec.* 477.

Necrosis of the tibia and fibula following amputation in the lower third of the leg, and unhealthy condition of the soft parts of the stump, rendered secondary amputation in the lower third of the thigh unavoidable in the following instance:

CASE 491.—Private W. H. Miller, Co. I, 72d Pennsylvania, aged 21 years, received a shot fracture of the tarsal and metatarsal bones of the left foot, at Antietam, September 17, 1862. Assistant Surgeon J. J. Woodward, U. S. A., recorded his admission, six days after the injury, to the Patent Office Hospital, Washington, where the injured limb was amputated on September 28th, by Acting Assistant Surgeon P. Middleton, the operation being performed by the circular method at the lower third of the leg. Several months afterwards the patient was transferred to Armory Square Hospital, and subsequently he passed through several hospitals in Philadelphia, entering Christian Street on March 21, 1864. Acting Assistant Surgeon R. J. Levis, in charge of the latter, reported that he found the patient's general health feeble, both bones of the stump necrosed in nearly their whole length, and the soft parts in a very unhealthy condition, necessitating a re-amputation at the lower third of the thigh, which he performed by the antero-posterior flap method on April 28, 1864. He also reported that the patient reacted promptly, and that his general health improved greatly after the second amputation, and that the stump healed readily. On September 3, 1864, the patient was discharged from service and became a pensioner. He was paid as such March 4, 1879. The amputated bones of the foot and the soft tissues, as well as the bones removed at the second operation, were contributed to the Museum by the respective operators (*Cat. Surg. Sect.*, 1866, pp. 440, 503, and 402, *Specs.* 97, 2748, and 4172). The last of these specimens is represented in FIG. 2 of PLATE LXXII, opposite, showing the dead shafts of the tibia and fibula surrounded by a quite complete involucrum, which, in size, approaches hypertrophy. The extremity of the fibula is roughened, but softened as if carious. The tibia approaches roundness, but its extremity is incomplete, exhibiting the end of the sequestrum.

[1] The late Dr. G. M. McGILL in a letter to the Surgeon General, U. S. A., dated April 12, 1866, says: "When a bone is cut in amputations, two conditions, I believe, must result from the action of its distal living bone tissues. First, metamorphosis into such transitional forms as will connect with ordinary fibrous tissue. Second, change of medullary tissue into such transitional tissue and into bone proper. If, then, we adapt living transitional tissue we substitute the mere action of union the cohesion of homologous formed material, the easiest in nature apparently, for the action of change that reproduces bone out of medullary tissue and forms a connective tissue, certainly by means of the germinal matter that lives in fully formed bone, and that has already performed the work of development and growth. Again, it might be reasoned, *a priori*, that in changes one and two, made, of course, feebly by substance of exhausted (?) formative energy, the least injury of the general health and the most trifling local injury are calculated to kill or set the germinal matter free (in the form of pus), and so throw the labor of formation, and, it may be, an added one of separation, upon more proximal forms. Thus we have sequestra, thus often osteomyelitis and pyæmia. With periosteum over the cut end of a bone, we have a tissue there whose office is to form, to connect, and to resist. So promising have the results of amputations with a periosteal flap been in my hands, that I am constrained, most respectfully, to call your attention again to the subject." The case of Allison and the preceding extract from Dr. MCGILL'S letter have been noted in *Circular* No. 3, S. G. O., War Department, Washington, 1871, p. 280, CASE 4.

Amputation at the knee joint had preceded amputation of the thigh in the next case:

CASE 492.—Private Cutler H. Rist, Co. A, 36th Wisconsin, aged 18 years, was wounded at Cold Harbor, June 1, 1864, by a conoidal ball, which entered on the inner and posterior portion of the left leg and caused a fracture of the tibia, which extended into the knee joint. He was immediately conveyed to the field hospital of the 2d division, Second Corps, where amputation at the knee joint was performed by Surgeon J. M. Burr, 42d New York. On June 11th, he was admitted into Lincoln Hospital, Washington, where Acting Assistant Surgeon C. H. Bowen reported: "Date of operation, June 3d; amputation at knee joint, leaving patella and condyles of femur." Dr. Bowen adds: "Having seen several of these operations performed, they have all died in periods varying from six to twenty days, from pyæmia, tetanus, etc., I totally discard the operation: 1st, from the extensive suppuration from the condyles of the femur and from the patella, from the duration of the suppuration, which will continue until the entire cartilaginous substance from condyles and patella is either cut away or has sloughed off by the work of nature, after which comes the continuous discharge of the synovial fluid from the wound. In the case of Rist, in which the limb was amputated on June 3, 1864, the synovia still exudes, in December, 1864, in quantities varying from a teaspoonful to a tablespoonful, and, more especially, after the least exertion, such as walking by means of crutches; besides, the cicatrix is of a sloughing character, tending to gangrene. December 14th, amputation not healed; continuous discharge of synovial fluid, more especially when walking; tendency to slough; patient otherwise in a healthy condition, and desires a re-amputation, and, in my opinion, the stump will never heal while remaining in its present condition." On December 15, 1864, Assistant Surgeon J. C. McKee, U. S. A., amputated the thigh at the lower third; skin flap and circular section of muscles. Simple dressings were applied. The patient recovered rapidly. He was transferred to Harvey Hospital, Madison, Wisconsin, on March 23d, and discharged from service May 20, 1865. His pension was paid March 4, 1879. Dr. McKee contributed a photograph of the patient (*Contributed Photographs*, Vol. II, p. 25), which is reproduced in the wood-cut (FIG. 206), and the pathological specimen, which consists of "the extremity of the left femur and the soft tissues forming the stump, after amputation through the knee joint." (*Catalogue of Surgical Section*, A. M. M., 1866, p. 502, *Spec.* 3514.)

FIG. 206.—Appearance of stump after amputation in lower third of thigh.

Primary amputation of the right leg at the upper third and secondary ablation at the lower third of the left thigh were performed in the next case. The patient survived the operations eight years:

CASE 493.—Private H. Brown, Co. K, 22d Colored Troops, aged 19 years, was wounded in both legs, at Petersburg, July 30, 1864. He was admitted to the Eighteenth Corps Field Hospital, where Surgeon S. A. Richardson, 13th New Hampshire, recorded "amputation of right leg." Surgeon J. H. Taylor, U. S. V., reported the following history: "The patient was admitted to Summit House Hospital, Philadelphia, August 17th, with shell wound of both legs, the right leg having been amputated at the upper third by flap method on the field. The stump of the right leg healed entirely, but the wound of the left tibia, which was injured in the upper third, resulted in necrosis of the bone extending into the knee joint, and was attended by extensive sloughing of the soft parts. The left limb was amputated on March 19, 1865, above the knee joint, by Acting Assistant Surgeon O. Shittler, the double flap method being employed and chloroform used. The treatment consisted of simple dressings, tonics, and stimulants. The stump healed kindly and the patient progressed well." Several months after the operation he was supplied with artificial limbs by the Palmer Arm and Leg Company. At the closing of Summit House Hospital the patient was transferred to Mower Hospital, and subsequently to the Post Hospital at Philadelphia. On September 11, 1866, he left for his home, cured, having been discharged from service to date from March 20, 1865. His name appeared on the Pension Rolls until July 14, 1872, when he died. The cause of his death has not been ascertained.

Fatal Secondary Amputations in the Lower Third of the Thigh.—One hundred secondary operations in the lower third of the femur proved fatal. Twenty-four were practised on Confederate and seventy-six on Union soldiers. In three the injuries had been caused by shell, in two by grapeshot, and in ninety-five by small projectiles. Pyæmia was noted in twelve, tetanus in one, and gangrene in twenty-one instances:

CASE 494.—Private *W. H. Powell*, Co. I, 3d South Carolina, aged 20 years, was wounded at Antietam, September 17, 1862, and entered hospital No. 5, Frederick, November 25th. Surgeon H. S. Hewit, U. S. V., recorded the following history: "The patient had been wounded by a grapeshot in the right leg and through the ankle joint, for which amputation had been performed at the middle third of the leg. The stump was doing badly, having commenced sloughing on the outer side. There was also much swelling. The granulations on the inner side of the stump were very exuberant. Pain in the knee joint indicated cartilaginous inflammation. Reamputation was deemed necessary, and was performed by Acting Assistant Surgeon A. V. Cherbonnier, above the knee, on November 30th. At the operation, the track of an old abscess was discovered, extending some distance up the thigh. Two days afterwards the stump showed some fungous granulations and the dressing was supplemented with a weak solution of nitric acid, with which the sinus was also injected. This treatment was kept up until December 10th, when

the stump had assumed a healthy appearance, but a large quantity of laudable pus was being discharged from the sinus. The injection was then increased and a tight bandage applied, and the dressing of the stump was changed to a solution of tannin. On the 20th, the stump was still doing well, and the sinus seemed to have closed, pus having ceased to come from it. On the 24th, the stump grew painful and the discharge ceased. Poultices were now applied and tincture of iodine used to the hip. Iodide of potassa was also prescribed in doses of five grains three times a day, and the same quantity of quinine, and one half ounce of cod-liver oil every four hours. On the 26th, the patient's condition had improved. The discharge of pus having become offensive, the stump was washed with a dilution of chlorinate of soda, the poultice discontinued, and wet strips applied." The patient was transferred to hospital No. 6 on December 29th, and to hospital No. 1 six weeks later. Assistant Surgeon R. F. Weir, U. S. A., in charge of the latter, recorded the termination of the case as follows: "At the time of admission the stump looked healthy and was suppurating, and the patient was in tolerable good health, but had quite a large bedsore above the sacrum, which was healing. He was taking tonics and stimulants, also iron mixture and cod-liver oil, and the stump was dressed with oakum saturated with acid wash. On February 29th, fluctuation was detected in the stump, and an opening was made on the anterior aspect one inch long, through which pus escaped. On March 17th, the patient complained of pain in the stump and more pus was discovered by the probe, necessitating another incision, one and one half inches long, to be made to allow it to escape, after which poultices were applied. Two days afterwards an abscess was discovered on the anterior aspect of the stump and just opposite the point of the previous incision, which on being opened evacuated two ounces of pus. For some days after this the patient was much better and the stump was improving slowly. One month later, however, he was noticed to be failing, and looking very pale and anæmic. Erysipelas was discovered in the stump on April 24th, for which lead and opium lotion was applied. At the same time the patient was suffering from considerable irritability of the stomach, being unable to retain any food or medicine for any length of time. Hydrocyanic acid having been administered for this without any good effect, lime water was given, which appeared to relieve the patient to some extent. On the following day the erysipelas was found to be extending to the opposite side and body, and, on April 28th, it was leaving the stump and was spreading still farther upon the body, the patient's condition being quite feeble, having no appetite, his tongue coated, skin dry, and pulse weak. During the two following days he was in a critical condition and unable to retain anything on his stomach, nourishment being given by the rectum. Hydrocyanic acid and lime water were now used without benefit, and tincture of opium was substituted with apparent relief. On the morning of May 1st, the patient appeared brighter, having rested well and being able to retain his nourishment. The erysipelatous inflammation had left the stump, but had extended across the body and was spreading down the other thigh. In addition to his treatment egg-mixture and tincture of iron was now prescribed for the patient. He failed rapidly on the next day, and died on the morning of May 3, 1863. At the *post-mortem* examination four ounces of purulent serum was discovered in each side of the chest, and the lungs were found to be partly congested, with small calcareous deposits in the upper lobe of the right side. The heart was of normal size, the cavity of the stomach very much congested, the liver having the appearance of fatty degeneration, the gall bladder very much distended, and the kidneys moderately congested. The tissues about the stump were healthy, but on opening the capsular ligament about two ounces of pus was found around the hip joint. The cartilage lining the acetabulum was softened, and in some places entirely gone. On dissecting out the nerves the bulbous expansions of their ends were shown to be well marked. Above the saphenous a wire ligature was found, which seemed to have given rise to little or no irritation. The patient had frequently complained of pain in the stump, but it is impossible to say whether it was caused by this ligature or by the abscesses that were forming from time to time. The end of the stump of the femur was found to be surrounded by an involucrum, exposing a small sequestrum running up the shaft." The amputated stumps of the tibia and fibula were forwarded to the Museum by the operator, and the stump of the femur was contributed by Acting Assistant Surgeon A. North.—(*Cat. Surg. Sect.*, 1866, p. 400, *Spec.* 795, and p. 300, *Spec.* 3837.)

In the following instance Syme's amputation at the ankle joint had been performed on the day of the injury, but continuous sloughing and abscesses followed, and amputation at the upper third of the leg and subsequently at the lower third of the femur were practised:

CASE 495.—Private F. M. Bland, Co. D, 23d Iowa, received a shot wound in the left foot, during the engagement at the Black River, May 19, 1863. "Syme's amputation at the ankle was performed the same evening at a field hospital. On June 13th, the patient was admitted into Adams Hospital, at Memphis, at which time nearly the entire flaps had sloughed off the stump and the bones were exposed to view. An abscess had also formed at about the middle of the lower third of the leg, and periostitis of the tibia and fibula existed at the same point. The general condition of the patient was low; he having suffered from diarrhœa for four months. He was put upon iron, quinine, stimulants, and astringents. On June 17th, his general condition being somewhat improved and the diarrhœa checked, it was decided to amputate, which was accordingly done at the junction of the upper and middle thirds of the leg by Acting Assistant Surgeon J. Thompson. I saw the patient for the first time on the following day, when, though in a low condition, he seemed to be rallying from the shock of the operation. I administered iron, quinine, stimulants, and beef tea, and had water dressings applied to the stump, under which course the general condition of the patient gradually improved. The stump at first appeared to do well, but before many days began to discharge thin ichorous looking pus. This was the condition of the patient when his ward was transferred to the charge of Acting Assistant Surgeon W. P. Sweetland. On June 26th, the wound gaped open, no adhesions having formed in any part of the stump, and the flaps soon commenced sloughing. It was then decided that the only chance for the patient rested in another operation, and accordingly, on July 2d, the thigh was amputated at the middle of the lower third. The patient seemed to bear up well under the operation, and, as before, seemed at first to be doing well. But soon the stump became gangrenous; an abscess also formed on the patient's shoulder below the clavicle, the edges of which sloughed, laying bare the thyroid axis and destroying its branches. On July 13th, the patient was removed to my ward in a rapidly sinking condition. He died on July 16, 1863." The foregoing history was transmitted by Acting Assistant Surgeon B. J. Bristol, and the bones removed at the second amputation were contributed to the Museum by Surgeon J. G. Keenon, U. S. V. (*Cat. Surg. Sect.*, 1866, p. 441, *Spec.* 1706.) The specimen shows the extremities to be necrosed, no reparative action having occurred.

TABLE XL.

Summary of Two Hundred and Seven Cases of Secondary Amputation in the Lower Third of the Femur for Shot Fracture.

[Recoveries, 1—107; Deaths, 108—207.]

No.	Name, Military Description, and Age.	Dates.	Operations, Operators, Result.
1	Allison, J., Farrier, I, 21st Pennsylvania Cavalry, age 19.	Ap. 5, '65, Feb. 16, 1866.	Left (hæm's; erysip.); ant. post. flap. A. A. Surg. H. McEldery, Disch'd March 20, 1866. *Specs.* 477, 403, 483.
2	Angell, J. A., Pt., D, 1st Wisconsin Cav., age 23.	July 23, Sept. 18, 1864.	Right (gang.; Aug. 1, '64, excis. tibia; hæm.); circ. A. A. Surg. J. C. Thorpe. June 16, '65, re-amp. Recovery. *Spec.* 5549.
3	Arendt, J., Pt., E, 5th Kentucky.	Jan. 1, Mar. 1, '63.	Left; flap. A. Surg. J. W. Pearce, 51st Ind. Disch'd Nov. 17, '63.
4	Bacon, W., Pt., I, 7th Maine, age 21.	J'y 12, '64, ——, '66.	Left (amp. leg; nec.; disch'd June 16, '65); flap. 1870, good stump. *Spec.* 2841.
5	Bass, J. B., Pt., K, 59th Illinois.	M'h 7, '62, Jan. 16, 1863.	Left (disch'd Sept. 20, '62); circ. Dr. S. Cabbot, Mass. Hospital. Necrosed bone removed.
6	Bassett, J. F., Pt., I, 114th New York, age 22.	Oct. 19, Nov. 29, 1864.	Left; ant. post. flap. A. A. Surg. A. W. Emory. Disch'd April 10, 1865. *Spec.* 3476.
7	Bennett, E. A., Pt., F, 44th New York, age 41.	May 22, 1864, Mar. 2, '69.	Left. (M. O. Oct. 11, '64; Dec. '64, nec. bone rem'd; Jan., '69, exc. up. frag. fibula.) Dr. T. Becket, Albany. Re-amputation.
8	Biddle, D., Corp'l, A, 107th Ohio, age 23.	July 1, Au. 13, '63.	Left; circ.; gang.; exfol. Disch'd June 24, 1864.
9	Bisbee, A., Corp'l, B, 7th Maine, age 25.	Ap. 16, '62, Ap. 8, '63.	Right (May 12, 1862, amp. leg; disch'd Feb. 10, 1863); circular.
10	Bishoff, D. D., Pt., B, 14th West Va., age 25.	May 9, '64, Mar. 13, 1865.	Left (nec.); circ. A. A. Surg. J. H. Butler. Disch'd May 20, '65.
11	Blakeley, J. W., Pt., F, 11th Massachusetts.	J'y 21, '61, No. —, '62.	Right (disch'd Sept. 29, '62); flap. Died Jan. 30, 1870; phthisis.
12	Boyd, H., Pt., D, 51st Colored Troops, age 42.	May 25, Je. 25, '65.	Left; lat. flap. A. A. Surg. R. H. Blandry. Recovered.
13	Bronson, J. B., Pt., I, 14th Ohio, age 18.	Aug. 5, ——, '64.	Right. (Pr. amp. leg.) Disch'd June 21, 1865.
14	Brooks, J. M., Pt., A, 17th Penn. Cav., age 28.	June 21, Sept. 10, 1863.	Left (June 21, amp. knee joint; gang.); ant. post. flap. Disch'd July 28, 1865.
15	Brown, H., Pt., K, 22d Colored Troops, age 19.	July 30, 1864, Mar. 19, 1865.	Left (July 30, amp. right leg); dou. flap. A. A. Surg. O. Shittler. Disch'd March 20, 1865. Died July 14, 1872.
16	Brown, W. C., Pt., K, 93d Ohio, age 23.	Se. 20, '63, April 12, 1864.	Left (erysip.); ant. post. flap. A. Surg. B. E. Fryer, U. S. A. Disc'd Oct. 7, 1864. *Spec.* 117.
17	Burdick, W. H., Pt., B, 82d Penn., age 24.	Ap. 6, '65, Mar. 27, 1866.	Right (exc. tibia; disch'd Oct. 12, 1865); flap. Dr. B. E. Phelps, Corry, Pa. 1870, stump healthy.
18	Chase, H. W., Pt., H, 96th New York, age 21.	Sept. 29, De. 1, '64.	Left; flap. A. A. Surg. E. Vogel. Disch'd April 14, 1865.
19	Clapp, F., Pt., K, 2d Mass. Cavalry, age 21.	J'y 13, '63, Mh 18, '64.	——; circular. A. A. Surg. J. F. Thompson. Disch'd Sept. 13, '64.
20	*Cobb, M.*, Lieut., A, 23d Alabama, age 39.	De. 15, '64, Jan. 19, 1865.	Right (Dec. 17, amp. leg; gang.); bi-lat. skin flap; circ. sect. musc. A. A. Surg. W. I. R. Holmes. Provost Marshal June 3, 1865.
21	*Comer, C.*, Serg't, F, 13th Virginia Cavalry.	June 19, Oc. 20, '63.	Right. Surg. I. P. Smith, C. S. A. Recovery.
22	Costello, P., Pt., E, 88th Illinois, age 26.	No. 25, '63, July 18, 1864.	Right; circ. Surg. G. Grant, U. S. V. Gang. Disch'd June 17, 1865. *Spec.* 3006.
23	Crawford, E., Pt., F, 105th Ohio, age 20.	Sept. 19, 1863, Aug. 5, 1864.	Right (Oct. 4, '63, amp. leg); circ. A. Surg. G. M. Sternberg, U. S. A. Hæm's; lig. prof. art. Disch'd March 18, 1865. *Spec.* 3108.
24	Derry, J. M., Pt., B, 126th Ohio, age 23.	Sept. 21, Oct. 30, 1864.	Right; nec.; sect. skin flap. A. A. Surg. B. B. Miles. Disch'd June 28, 1865. *Spec.* 3417.
25	Desmond, H., Pt., I, 28th Massachusetts, age 29.	De. 13, '62, ——, '63.	Right (Dec. 21, '62, amp. knee j't); post. flap. Disch'd Dec. 22, '63.
26	Dickens, H. S., Pt., H, 126th N. Y., age 30.	J'y 2, '63, April 24, 1864.	Left (July 11, amp. leg); ant. post. flap. A. A. Surg. R. J. Lewis. Disch'd April 28, '65. *Spec.* 2740.
27	[1] Doerflinger, C. H., Lt., B, 26th Wis., age 20.	May 2, Je. 27, '63.	Left; circ. Surg. J. A. Lidell, U. S. V. Disch'd Feb. 25, 1864.
28	Dudley, W. F., Pt., F, 1st Maine Cav., age 24.	Mar. 1, June 14, 1864.	Left (March 2, amp. leg; gang.); circular. A. Surg. W. Webster, U. S. A. Disch'd Aug. 14, 1865.
29	Duran, J., Corp'l, C, 17th Maine, age 23.	M'y 6, '64, May 18, 1865.	Left (gang.; Aug. 28, amp. leg); circ. Surg. G. Derby, U. S. V. Disch'd August 7, 1865.
30	Eastman, J., Pt., E, 1st Wisconsin.	Sept. 19, Dec. 25, 1863.	Right (gang.); circ. A. A. Surg. W. E. Whitehead. Disch'd Nov. 29, 1864. Died April 10, 1870. *Spec.* 2035.
31	Eaton, D. C., Corp'l, H, 5th New Hamp., age 30.	Sept. 17, De. 29, '62.	Left. (Sept. 17, amp. leg.) Disc'd March 13, '63. Died July 1, '63.
32	*Elliott, T. A.*, Corp'l, Shumaker's Battery.	Jan. 4, Fe. 18, '62.	——. Surg. H. McGuire, C. S. A. Recovered.
33	Eustis, J. B., Pt., E, 149th New York, age 23.	Oc. 28, '63, Jan. 21, 1864.	Left (hæm.); circ. Surg. W. Varian, U. S. V. Disch'd April 3, 1864. *Spec.* 2097. Died Feb. 18, 1875; consumption.
34	Fergus, J., Pt., A, 70th Indiana, age 34.	May 14, Aug 15, 1864.	Left (June 24, exc. fib.; gang.; tib. art. sloughed; hæm.); circular. Surgeon R. L. Stanford, U. S. V. Disch'd Jan. 20, 1865.
35	Fisher, A., Pt., C, 7th N. Y. H'vy Art'y, age 26.	June 17, Oc. 19, '64.	Left; circ. Surg. J. W. Merriam, U. S. V. Disch'd June 24, 1865.
36	Fletcher, D. M., Pt., 10th Ind. Battery, age 25.	Oc. 27, '64, ———	Right (Oct. 28, amp. leg); flap. Mustered out July 10, 1865.
37	Fulwiler, L. B., Pt., A, 20th Indiana.	June 25, J'y 26, '62.	Left; flap. A. Surg. P. Goddard, U. S. V. Disch'd Aug. 22, 1862.
38	Garlick, J., Pt., I, 26th Pennsylvania, age 21.	May 3, J'y 11, '63.	Right; flap. Disch'd June 27, 1864.
39	Glavin, D., Pt., E, 87th New York.	June 1, July 2, 1862.	Left (frag. of bone rem'd); double flap. A. Surg. W. Thomson, U. S. A. Disch'd Feb. 28, 1863. *Spec.* 4931.
40	Graham, R. P., Pt., H, 7th Illinois, age 23.	Oct. 5, Nov. 9, 1864.	Right; circ. A. A. Surg. D. C. Bell. Hæm.; lig. fem. artery. Disch'd May 22, 1865.
41	Grant, W., Pt., G, 9th N. York Artillery, age 36.	Oct. 19, No. 26, '64.	Right; ant. post. flap. A. A. Surg. C. H. Jones. Disch'd Feb. 2, '65.
42	Hadlow, H., Pt., H, 81st New York, age 21.	May 31, Aug. 1, 1862.	Right (prim. amp. leg; July 24, gang.); circ. Aug. 15, re-amp. mid. third. Necrosed. Disch'd May 2, 1863.
43	Hagadone, A., Serg't, M, 2d New York Heavy Artillery, age 29.	Aug. 25, Nov. 21, 1864.	Right (gang.; nec.); flap. A. A. Surg. W. H. Ensign. Disch'd July 12, 1865. *Spec.* 3436.
44	Ham, W., Pt., G, 42d Indiana, age 20.	Sept. 20, De. 6, '63.	Left; circ. A. Surg. N. Teal, 88th Indiana. Disch'd Sept. 30, 1864.
45	Hanley, M., Pt., A, 18th Connecticut, age 19.	June 13, Dec. 23, 1863.	Left; circ. A. A. Surg. C. H. Jones. Disch'd June 15, 1864. Died March 2, 1866. *Spec.* 1993.
46	Hill, G. N., Corp'l, A, 5th Colored Troops, age 21.	Sept. 29, De. 29, '64.	Left; lateral flap. Recovery.
47	Hoffman, F., Pt., H, 2d Penn. Heavy Artillery, age 21.	June 18, Dec. 6, '64	Left (July 11, amp. leg); flap. A. A. Surg. J. S. Waggoner. Disch'd August 15, 1865. *Spec.* 3714.
48	Hogg, W., Pt., I, 76th New York, age 34.	May 5, J'ne 7, '64.	Right; ant. post. flap. Surg. E. Donnelly, 2d Penn. Reserves. Disch'd May 6, 1865.
49	Hubbard, A., Pt., D, 6th New York Cav., age 31.	July 22, 1864, Jan. 1, '65.	Left (inter. amp. leg; ext. nec.); circ. A. Surg. S. H. Orton, U. S. A. Disch'd Nov. 7, 1865. *Spec.* 278.
50	Inman, A. W., Pt., B, 124th Ohio, age 30.	May 27, J'y 5, '64.	Left; circular. Disch'd June 15, 1865.
51	*Jinnett, J.*, Pt., D, 67th North Carolina.	De. 29, '63, J'e 22, '64.	——. Surg. — Turner, C. S. A. Recovery.
52	Kerrin, J., Pt., G, 19th Infantry, age 27.	Aug. 13, ——, —, 1864.	Right (Aug. 13, amp. leg; gang.); flap. A. Surg. T. A. McGraw, U. S. V. Bone rem'd. Disch'd June 4, 1865.
53	Kimball, L. N., Pt., H, 22d Mass., age 19.	May 10, 1864, Jan. —, 1867.	Right. (May 10, '64, amp. leg; hæm.; lig. Disch'd Oct. 17, '64.) Dr. W. H. Thorndike, Boston, Mass. Recovery.
54	Kirk, W. H., Capt., D, 3d N. C. M't'd Infantry.	De. 29, '64, Feb. 4, '65.	Right; circular. Resigned May 15, 1865.
55	Klammer, A., Pt., E, 5th Minnesota, age 26.	De. 16, '64, Feb. 10, 1865.	Right (nec. fragm'ts rem'd); circ. A. A. Surg. H. M. Lilly. Disch'd June 1, 1865. *Spec.* 4245.
56	*Love, J. W.*, Pt., D, 25th Georgia, age 24.	De. 7, '64, Au. 31, '65.	Left; oval flap. A. A. Surg. G. E. Sloat. Disch'd Jan. 14, 1866.
57	Lowth, J., Serg't, M, 4th Wisconsin Cavalry, age 26.	Aug. 24, 1864, June 2, 1865.	Right (gang.; May 27, '65, exc. fib.; lig. post. tib. art'y); at condyles. Surg. H. Culbertson, U. S. V. Disch'd July 17, 1865.
58	Mason, D., Corp'l, G, 104th Illinois, age 23.	May 14, July 6, 1864.	Right; circ. A. Surg. C. W. Lawrence, 22d Mich. Disch'd Jan. 6, 1865.
59	McClelland, W. H., Pt., A, 12th Ohio Cavalry.	De 18, '64, Feb. 7, '65.	Right; circ. Confed. surgeon. Disch'd Sept. 11, 1865.
60	McCue, A., Pt., G, 21st Massachusetts.	Sep. 1, '62, Feb. 27, 1864.	Left (disch'd June 23, '63); circ. Dr. B. S. Shaw, Mass. Hospital. Recovery.
61	McIntire, G., Pt., I, 7th Maine, age 24.	May 10, Oct. 16, 1864.	R't (May 11, amp. leg); ant. post. flap. A. A. Surg. G. E. Brickett. Hæm. Disch'd June 16, 1865.

201	Wenzell, A., Pt., E, 121st Pennsylvania, age 21.	J'y 1, '63, Sept. 9, 1864.	Right (fragm'ts nec. bone rem'd); oval skin flap; circ. muscles. A. A. Surg. J. H. Jamar. Died Sept. 28, 1864; pyæmia.				

The seat of fracture in the foregoing two hundred and seven cases was in the lower third in seventeen; in the knee joint, in seventy-three; in the leg, in ninety-one; and in the ankle joint or foot in twenty-six instances.

Secondary Amputations of the Thigh, Point of Ablation not specified.—Of twelve secondary amputations in which the seat of operation was not indicated, nine were performed on Union and three on Confederate soldiers; all resulted fatally. Seven operations were on the right, two on the left side; in three cases this point was not recorded. In two instances total excision of the knee joint and in two other cases amputation in the leg had preceded the ablation of the thigh. One of the latter cases is here detailed:[1]

Case 496.—Private G. R. Hathaway, Co. A, 125th Illinois, aged 24 years, received a shot fracture of the tarsal bones of the left foot, at Kenesaw Mountain, June 27, 1864. Five days after the reception of the injury he entered the field hospital at Chattanooga, where amputation was performed, but not recorded. Surgeon B. Cloak, U. S. V., reported the termination of the case as follows: "The patient was admitted to Cumberland Hospital, Nashville, July 11th, having undergone amputation of the leg below the knee previous to his admission. On August 11th, a second amputation was performed above the knee, by the antero-posterior flap method, by Acting Assistant Surgeon J. C. Thorpe. The flaps at the time of the second operation had become indolent and slightly gangrenous and could not be brought to cover the protruding bones; the patient's condition being weak and anæmic and his tongue whitish. Stimulating dressings were applied to the stump of the thigh, which looked clean but failed to close by first intention, though it became covered with healthy granulations. The patient died of irritative fever September 9, 1864."

Table XLI.

Summary of Twelve Fatal Cases of Secondary Amputations in the Thigh for Shot Fracture of the Femur, the point of Ablation not specified.

4	Hawkins, W., Pt., C, 17th Ohio.	Se. 20,'63, Feb. 28, 1864.	Right; circ. Surg. S. E. Fuller, U. S. V. Died March 21, 1864; pyæmia.	11	*Vaughn, W.*, Pt., B, 13th South Carolina.	———	Right thigh. Died June 26, 1864.
5	Kellum, T. H., Pt., B, 89th Indiana, age 18.	May 18, J'y 18,'64.	Right; circ. Surg. E. Powell, 72d Ill. Died Aug. 3,'64; septæmia.	12	Whitbeck, O., Pt., D, 109th N. York, age 29.	May 6, J'y 9, '64.	Right. (Typ. fev.) Dr. G. Burr, Binghamton. Died July 10,'64.

[1] The other instance is that of Farrier J. Dowd, M, 10th Missouri Cavalry, aged 24; wounded at Cherokee, April 18, 1863; shot fracture of right foot; April 19th, amputation of leg at lower third by Surgeon P. N. Wood, 39th Iowa; discharged January 25, 1864. In 1865, gangrene appeared on the stump; bromine was applied without effect; amputation of the thigh; necrosis of femur in November, 1867; re-amputation and death November 15, 1867.

AMPUTATIONS IN THE CONTINUITY OF THE FEMUR, OF UNCERTAIN DATE.—In five hundred and eighteen cases of amputations in the thigh for shot injury the intervals between the injuries and operations are unknown, one or the other or sometimes both dates having been omitted in the reports. The ablations were practised in the upper third in thirty-three, in the middle third in seventy, in the lower third in one hundred and four, and at an unspecified portion of the thigh in three hundred and eleven cases. Although the recorded data are generally meagre, the results have been ascertained in all but thirty-two cases. One hundred and sixty-three had successful, and three hundred and twenty-three fatal terminations, a mortality rate of 66.4 per cent.

Amputations in the Upper Third of the Thigh, of Uncertain Date.—There were thirty-three amputations in the upper third of the thigh, in which the length of interval between the injury and operation could not be ascertained. Twenty-eight of the patients were Confederate, and five were Union soldiers; twelve recovered and twenty-one died.

Successful Cases of Amputation in the Upper Third of the Thigh, of Uncertain Date. The twelve operations of this group were all performed on Confederate soldiers—on the right side in four, on the left in three, unspecified in five cases. The nature of the missiles and the methods of operating are not recorded.

Fatal Cases of Amputation in the Upper Third of the Thigh, of Uncertain Date.—There were twenty-one operations of this class, five performed on Union and sixteen on Confederate soldiers; eight on the right and nine on the left limb; in four cases the side was not specified. No antecedent operations were recorded.

17	Burley, H. H., Pt., G, 49th Pennsylvania, age 21.	May 12, ——,'64.	Right. Extensive bedsore over sacrum. Died June 6, 1864.				

Amputations in the Middle Third of the Thigh, of Uncertain Date—In this group are recorded seventy cases, of which thirty-four were successful, twenty-nine proved fatal,

while the result in seven cases could not be ascertained. Fifty-three of the patients were Confederate, and seventeen Union soldiers. The amputations were on the right side in twenty-eight, on the left in thirty-one, not reported in eleven instances. The seat of fracture in these cases was in the middle third of the femur in one, in the lower third in sixteen; in the femur, precise seat not recorded in forty-two; in the knee joint in seven, and in the leg in four instances.

TABLE XLIII.

Condensed Summary of Seventy Cases of Amputation in the Middle Third of the Femur, of Uncertain Date.

[Recoveries, 1–34; Deaths, 35–63; Results unknown, 64–70.]

No.	Name, Military Description, and Age.	Dates.	Operations, Operators, Result.
1	*Baldwin, J.*, Pt., A, 26th North Carolina.	July 2, ——, '63.	Left; gangrenous. Paroled Nov. 12, 1863.

70	Phelix, —, Colored servant, age 25.	——	Left thigh.

[1] SMITH (E. H.), *Report of Cases of Compound Comminuted Fracture of Femur*, in *Confed. States Med. and Surg. Jour.*, 1864, Vol. I, p. 24.

Amputations in the Lower Third of the Thigh, of Uncertain Date.—This group comprises one hundred and four cases, with thirty-seven recoveries, sixty-one deaths, and six cases in which the final result could not be ascertained. The operations were performed on thirty-two Union and seventy-two Confederate soldiers; thirty-seven amputations being on the right and forty-six on the left side, while in twenty-one this point was not recorded. The seat of the injury was in the lower third of the femur in fifty-two, in the knee joint in twenty seven, in the leg in twenty-four, and in the foot in one instance. In one of the fatal cases the patient had undergone amputation of the arm, and, in a second, hæmorrhage from the femoral artery was followed by ligation of that vessel.

TABLE XLIV.

Condensed Summary of One Hundred and Four Cases of Amputations in the Lower Third of the Thigh, of Uncertain Date.

[Recoveries, 1–37; Deaths, 38–98; Result unknown, 99–104.]

No.	Name, Military Description, and Age.	Dates.	Operations, Operators, Result.	No.	Name, Military Description, and Age.	Dates.	Operations, Operators, Result.

94	*Spain, H. P.*, Pt., D, 21st South Carolina.	———	Left thigh. Died June 9, 1864.
95	Templin, W. C., Corp'l, C, 73d Ohio.	July —, ——,'63.	Left thigh. Died August 9, 1863.
96	Thompson, G. T., Pt., F, 56th North Carolina.	———	Left thigh. Died April 12, 1865.
97	Walker, H., Pt., F, 27th Massachusetts, age 35.	July 14, ——,'64.	Right. Died August 3, 1864; exhaustion.
98	*Webb, J.*, Pt., C, 5th Arkansas.	Oct. 8, ——,'62.	Left. Died November 2, 1862.
99	*Barrett, J. L.*, Pt., H, 21st Virginia.	———	Right thigh.
100	*Fewell, J. W.*, Pt., A, 4th Virginia Cavalry.	——— 1865.	Right thigh.
101	*Prather, J.*, Pt., H, 41st Alabama.	———	Left thigh.
102	*Racer, W.*, Pt., Fry's Battery, Orange Art.	———	Left thigh.
103	Thomas, C., Pt., G, 5th Col'd Troops, age 22.	Sept. 29, ——,'64.	Left thigh.
104	*Tibbs, J. A.*, Pt., F, 50th Alabama.	——— 1865.	Left thigh.

Amputations in the Continuity of the Femur, of Uncertain Date, and without Indication of the Seat of Operation.—In three hundred and eleven cases of amputations of the thigh the interval between the injury and the operation and also the precise seat of the operation were not recorded. The operations were performed on three hundred and nine patients, in two instances both thighs having been amputated; seventy-nine, among them one with an amputation of both thighs, recovered, and two hundred and eleven perished, while the fate of nineteen could not be ascertained, giving a death-rate of 72.7 per cent. for the determined cases. Eighty-nine were Union, and two hundred and twenty were Confederate soldiers. The three hundred and eleven operations were on the right side in eighty-nine instances, on the left in one hundred, and not stated in one hundred and twenty-two. Such meagre details as are entered on the records of this Office will be found in the following table:

Table XLV.

Condensed Summary of Three Hundred and Eleven Cases of Amputations of the Thigh, of Uncertain Date and Seat.

[Recoveries, 1–80; Deaths, 81–292; Result unknown, 293–311.]

No.	Name, Military Description, and Age.	Dates.	Operations, Operators, Result.
1	*Barclay, R. G.*, Lieut., G, 5th Louisiana.	May 3, ——,'63.	Right. Furloughed October 26, 1863.

The seat of fracture was recorded to have been in the lower third of the femur in two; in the femur, precise location not specified, in three hundred and four; in the knee joint in one; and in the leg in four instances. The two patients with amputations of both thighs were Confederate soldiers; one recovered and was furloughed, and has not been heard from since; the other died shortly after the operation.

Recapitulation.—Six thousand two hundred and twenty-nine cases of amputation in the shaft of the femur have been enumerated in Tables XXX to XLV, inclusive, and the results ascertained in all but eighty cases. Two thousand eight hundred and thirty-nine had successful and three thousand three hundred and ten fatal terminations, a mortality rate of 53.8 per cent. Had it been practicable to determine the issues in the eighty cases with unknown results the fatality rate would only be slightly modified. Assuming that all these eighty cases had proved fatal the mortality would be 54.4 per cent., an increase of only 0.6 per cent.; or, supposing all the eighty cases terminated successfully the decrease in the rate of mortality would be 0.7 per cent., leaving a fatality of 53.1 per cent., a deviation of only a little over one half of one per cent. from the percentage of fatality obtained in the determined cases.

In five thousand seven hundred and eleven of the six thousand two hundred and twenty-nine amputations in the femur the precise length of time between the injury and the operation was recorded. Three thousand nine hundred and forty-nine, or over two-thirds, were primary operations; one thousand three hundred and twenty intermediary, and four hundred and forty-two, only, secondary operations. In the three thousand nine hundred and forty-nine primary operations the results were not ascertained in forty-eight instances; one thousand nine hundred and fifty-eight were successful, and one thousand nine hundred and forty-three fatal, a mortality rate of 49.8 per cent. One thousand three hundred and twenty intermediary operations were followed by four hundred and seventy-nine recoveries and eight hundred and forty-one deaths, a fatality of 63.7 per cent. Four hundred and forty-two secondary operations comprise two hundred and thirty-nine recoveries and two hundred and three deaths, a mortality of 45.9 per cent. Of the remaining five hundred and eighteen cases in which the time between the injury and operation could not be ascertained, thirty-two were recorded as without result, one hundred and sixty-three as recoveries, and three hundred and twenty-three as fatal, a death rate of 66.4 per cent. The foregoing results differ somewhat from those obtained in the series of amputations of the arm (*Second Surgical Volume*, p. 805). In the latter, the primary operations gave a mortality of 18.4 per cent.; the intermediary, of 33.4; and the secondary, of 27.7 per cent.,—the fatality of the secondary operations exceeding that of the primary,—while in the femur the mortality of the primary amputations exceeds that of the secondary.

Considering the series of amputations in the continuity of the thigh according to the seat of the original injury (TABLE XLVI) it will be seen that the femur had been fractured in twenty-nine hundred,[1] or in 46.6 per cent. of the total number of amputations; the

knee joint in twenty-three hundred and ninety-nine, or 38.5 per cent.; the bones of the leg in eight hundred and sixty-four, or 13.8 per cent.; and the ankle joint or foot in sixty-six, or 1.1 per cent. Of the twenty-nine hundred amputations for shot fractures of the femur twelve hundred and fifty-seven were successful, fifteen hundred and sixty-three fatal, and eighty results could not be ascertained, a mortality of 55.4 per cent.; of these the amputations following fractures of the upper third had a fatality of 73.6 per cent.; those following fractures of the middle third a mortality of 55.3 per cent.; and those following fractures of the lower third a death rate of 45.0 per cent. The ratio of mortality of the twenty-three hundred and ninety-nine amputations following shot injuries of the knee was 51.1 per cent., eleven hundred and seventy-three patients having recovered, and twelve hundred and twenty-six having died. The mortality of the eight hundred and sixty-four amputations of the thigh for shot injuries of the leg was 56.1 per cent., four hundred and eighty-five of the eight hundred and sixty-four operations having proved fatal. Finally, the sixty-six

[1] While the total number of amputations following shot fractures of the femur as cited in this table, viz: 2,900, agrees with the total number of amputations as indicated in TABLE XX, page 175, *ante*, the figures in several of the subdivisions have been slightly modified, as, in the progress of the work, the results as well as the seats of fracture in several cases classified in TABLE XX as "undetermined" or "unspecified" were ascertained. Thus, the number of amputations for fractures of the upper third remains the same, 93 cases with 24 recoveries, 67 deaths, and 2 undetermined results. The amputations for fractures in the middle third are 360, as in TABLE XX, but the number of recoveries is increased by 2, while the undetermined cases number 2 less. Similarly the total number of amputations for fractures in the lower third is increased by 2, and those for fractures with unspecified seat decreased by 2, the seats of fracture in these cases having been determined since the publication of TABLE XX. Finally, the results have since been ascertained in 5 cases recorded in TABLE XX as undetermined with unspecified seat of injury, thus giving, in this group, 466 recoveries and 56 undetermined results instead of 461 recoveries and 63 unknown results.

operations for shot injuries of the ankle joint or foot were followed by thirty-six deaths, a fatality of 54.6 per cent. Thus it would seem that of the amputations in the thigh performed for shot fractures, those for fractures of the lower third of the femur offered the best chance for life.

The point of section or ablation in the thigh was in the upper third in seven hundred and sixty-eight, in the middle third in one thousand eight hundred and sixty-six, in the lower third in two thousand nine hundred and one, and in the femur, point not specified, in six hundred and ninety-four instances. The mortality rate of the first group was 53.8 per cent., of the second, 44.5, of the third, 53.6, and of the last, 80.7 per cent., the death rate being the largest in amputations in the upper third, next in the amputations of the lower third, and lowest in those of the middle third, a result differing from that obtained in the different thirds of the arm, where the operations in the upper third were less fatal than those in the lower third (*Second Surgical Volume*, pp. 805, 806), the percentage of fatality after amputation in the upper third being 18.4, in the middle third 16.4, and in the lower third 26.0 per cent.

Of the six thousand two hundred and twenty-nine amputations in the continuity of the femur the side was not indicated in seven hundred and nine cases. The right side was involved in two thousand six hundred and ninety-eight, the left in two thousand eight hundred and twenty-two. Of the former, one thousand two hundred and ninety-six recovered, one thousand three hundred and seventy-three died, and in twenty-nine cases the results were unknown, a death rate of 51.4; of the latter, one thousand three hundred and seventy-seven recovered, one thousand four hundred and sixteen died, and in twenty-nine cases the results were undetermined, a mortality of 50.7 per cent. This would point to the fact already noticed in the discussion on the amputations of the shoulder joint and arm (*Second Surgical Volume*, pp. 655, 806), that the left extremity, although most frequently interested, had a less proportionate fatality than the right; but the difference in the mortality rates of the two sides is too insignificant to allow conclusions to be drawn, especially as the number of undetermined cases is sufficiently large to materially modify the result.

As already stated on page 214, *ante*, the six thousand two hundred and twenty-nine operations were performed on six thousand two hundred and nine patients, twenty having submitted to amputations of both thighs.[1] Four thousand seven hundred and seventy-one were Union, and one thousand four hundred and thirty-eight were Confederate soldiers. Of the Union soldiers, two thousand and ninety-six recovered and two thousand six hundred and fifty-seven died, while the results in eighteen cases were undetermined, a mortality of 55.9 per cent. Of the Confederates, seven hundred and forty survived, six hundred and thirty-six died, and the fate of sixty-two remained undecided, a fatality of 46.2 per cent.

[1] Of the twenty cases of amputations of both thighs, three were successful, viz: Corporal M. Dunn, H, 46th Pennsylvania (CASE 448, p. 242, and Nos. 239, 240, TABLE XXXII, p. 248); Private *C. G. Rush*, C, 21st Georgia (CASE 449, p. 243, and Nos. 737, 738, TABLE XXXII, p. 254); Private *J. A. Parker*, L, Cobb's Legion Cavalry (Nos. 49, 50, TABLE XLV, p. 328). The seventeen fatal cases are: Pt. S. Baguley, B, 5th New Hampshire (No. 703, TABLE XXXI, p. 235, and No. 105, TABLE XXXIX, p. 105); Serg't T. Deud, C, 2d Michigan (CASE 442, p. 226, and Nos. 806, 807, TABLE XXXI, p. 236); Corp'l J. W. Woodworth, H, 11th Infantry (CASE 443, p. 226, and Nos. 1143, 1144, TABLE XXXI, p. 240); Pt. S. Allen, G, 59th Massachusetts, Nos. 984, 985, TABLE XXXII, p. 257); Pt. R. S. Michael, A, 105th Pennsylvania (Nos. 1551, 1552, TABLE XXXII, p. 263); Pt. D. Nicholson, H, 22d Massachusetts (Nos. 1599, 1600, TABLE XXXII, p. 264); Serg't E. C. Rabbit, B, 10th Missouri (Nos. 1652, 1653, TABLE XXXII, p. 264); Pt. J. Stewart, D, 77th New York (Nos. 1769, 1770, TABLE XXXII, p. 265); Lieut. J. Whelpley, D, 1st Maine (Nos. 1862, 1863, TABLE XXXII, p. 267); Pt. S. Goodwell, G, 29th Illinois (Nos. 128, 129, TABLE XXXIII, p. 269); Pt. *H. Kenner*, 4th Virginia (Nos. 169, 170, TABLE XXXIII, p. 270); Pt. C. Meyer, 30th Missouri (Nos. 212, 213, TABLE XXXIII, p. 270); Pt. W. F. Mills, E, 8th New York H. A. (No. 205, TABLE XXXIII, p. 270, and No. 495, TABLE XXXVI, p. 300). Pt. H. Tieman, C, 119th New York (Nos. 285, 286, TABLE XXXIII, p. 271); Pt. J. Moore, E, 46th Pennsylvania (Nos. 497, 498, TABLE XXXVI, p. 300); Pt. D. Wallace, I, 5th Artillery (Nos. 642, 643, TABLE XXXVI, p. 302); Pt. *G. Nunenger*, A, 58th Virginia (Nos. 219, 220, TABLE XLV, p. 330). Of the 20 cases, 2 were primary operations in the middle thirds; 8, primary operations in the lower thirds; 4, primary operations, the seat not recorded; 2, intermediary operations of both thighs in the lower thirds; 2, amputations of both thighs, time and operation not stated; 1, primary amputation of the right and intermediary of the left thigh, and 1, primary amputation of right and secondary operation in left thigh.

The following tabular statement will enable the reader to compare the results of the amputations in the thigh of the American civil war with those of other wars:

TABLE XLVII.

Results of Amputations of the Thigh on the Occasions named and from the Authorities quoted.

nineteen had successful, and seven thousand and forty-nine fatal terminations, a death rate of 83.2 per cent.

CONCLUDING OBSERVATIONS ON SHOT INJURIES OF THE FEMUR.

Until the middle of the present century the majority of the writers on military surgery insisted upon immediate amputation as the only means of saving life in comminuted shot fractures of the femur,[1] while there were a few only who questioned the necessity of the operation, and who declared[2] that not only life but also a more or less useful limb might be

[58]BIEFEL (R.), *Kriegschir. Aphorismen von* 1866, in LANGENBECK'S *Archiv*, Berlin, 1869, B. XI, p. 475 (7 fatal). [59]MAAS (H.), *Kriegschirurgische Beiträge*, Breslau, 1870, p. 73 (3 recoveries, 6 fatal). [60]GRITTI (R.), *Nuovi documenti in favore della cura conservativa*, etc., in *Ann. Universali di Med.*, Milano, 1868, Vol. CCV, p. 518 *et seq.* [61]OTIS (G. A.), *Circular* No. 3, War Department, S. G. O., Washington, 1871, p. 205 *et seq.* (6 recoveries, 6 fatal); 17 amputations following shot wounds are reported in *Circular* 3, but 5 of these cases are from the American civil war, 1861–65, and are included in the preceding tables of amputations. [62]HEINZEL, *Ueber die conservirende Behandlung der Kniegelenkschüsse*, in *Deutsche Militairärzt. Zeitschrift*, 1875, Jahrgang IV, pp. 358–59. [63]CHENU (J. C.), *Aperçu hist. Stat. et Clin. sur le service des ambulances et des Hôpitaux*, etc., Paris, 1874, T. I, p. 493. [64]TILING (G.), *Bericht über* 124 *im serbisch-türkischen Kriege*, etc., *behandelte Schussverletzungen*, Dorpat, 1877, pp. 66–69 (2 fatal). [65]STEINER (F.), *Aus dem Tagebuche eines deutschen Arztes während der Zeit des Krieges im Oriente* 1876, in *Wiener Med. Wochenschrift*, 1877, p. 657 (2 recoveries, 3 fatal). Of these 9,017 operations 366 were in the upper third of the femur, 503 in the middle third, 436 in the lower third, and in 7,712 the seat of ablation was not specified. The results in the upper third amputations were 133 recoveries, 232 deaths, and 1 unknown result, a fatality of 63.5 per cent.; in the middle third, 213 recoveries, 290 deaths, or 57.6 per cent. fatality; in the lower third, 211 recoveries and 225 deaths, a mortality of 51.6 per cent.; and in the femur, seat not specified, 862 recoveries and 6,302 deaths, with 548 undetermined results, a fatality of 87.9 per cent.

[1]GUTHRIE (G. J.) (*Treatise on Gunshot Wounds*, London, 1827, p. 373) remarks: "Injuries of the femur from musket balls are the more common wounds that render amputation necessary," and, on p. 375, "Upon a review of the many cases I have seen I do not believe that more than one-sixth recovered so as to have useful limbs; two-thirds of the whole died, either with or without amputation; and the limbs of the remaining sixth were not only nearly useless, but a cause of much uneasiness to them for the remainder of their lives." LARREY (D. J.) (*Clinique Chirurgicale*, Paris, 1829, T. III, p. 636): "Lorsque les coups sont reçus au centre ou à la partie supérieure de la cuisse, de manière que le projectile la traverse d'avant en arrière, en fracturant le fémur, l'amputation devient indispensable." KERVÉGUEN (H. G.) (*Des cas d'amputation dans les plaies d'armes à feu*, Paris, 1847, p. 33) notices one or two recoveries from pistol shot; but remarks that "these fortunate results must be regarded as exceptions which must not be set up in opposition to the regular rule, viz: that we must amputate whenever the femur is fractured by shot." SCHWARTZ (H.) (*Beiträge zur Lehre von den Schusswunden. Gesammelt in den Feldzügen der Jahre* 1848, 1849 *und* 1850, Schleswig, 1854, pp. 155, 168) cites cases of shot fractures of the shaft of the femur of the Schleswig-Holstein War, 1848–1850, and advises primary amputation in all cases of extensive comminuted fractures, whether in the upper, middle, or lower thirds of the femur. BLENKINS (G. E.) (in his article *Gunshot Wounds*, in COOPER'S *Dict. of Practical Surgery*, London, 1861, Vol. I, p. 817) remarks: "Were I to judge, then, from my own personal observations in the army, and from some other cases which I saw under my colleagues, I should, without hesitation, recommend immediate amputation in all cases of compound fracture of the thigh caused by grapeshot, musket balls, etc."

[2]LE DRAN (H. F.) (*Traité ou reflexions tirées de la pratique sur les plaies d'armes à feu*, Paris, 1737, p. 221) evidently believed that a useful limb might be preserved after comminuted fracture of the femur: "Sans parler des pansemens qui sont énoncés dans la premiere partie, je dirai seulement, que supposant le *fœmer* fracturé en éclats, et qu'il y eut lieu d'espérer de conserver la cuisse, on doit après avoir fait ce que l'art prescrit, faire ensorte de fixir le reste des pieces fracturées, de maniére qu'elles ne jouent pas l'une contre l'autre, comme je l'ai dit en parlant des playes au bras." HUTIN (*Recherches sur le résultat des fractures de la moitié supérieure de la cuisse, etc.*, in *Rec. de Mém. de Méd. de Chir. et de Phar. Mil.*, 1854, T. XIV, p. 253), on page 272, believes that the facts cited by him "démontrent que l'on ne doit pas adopter exclusivement le précepte de recourir *toujours* à l'amputation dans les cas dont il s'agit, et qu'il est de ces fractures dont on peut espérer une guérison bonne et durable, quoiqu'elle ne laisse qu'un membre difforme."

preserved to the patient by an expectant conservative mode of treatment. From the following statistical summary of fractures of the femur treated by conservation, recorded in other wars, it will be seen that of a total of three thousand four hundred and seventy-four cases only about two hundred and fifty antedated the year 1850. But with improvements

TABLE XLVIII.

Results of Shot Fractures of the Femur treated by Conservation on the Occasions named and from the Authorities quoted.

ACTION, ETC.	CASES.				UPPER THIRD.			MIDDLE THIRD.			LOWER THIRD.			SEAT NOT INDICATED.

in the manner of securing immobility of the limb, in facilitating the requisite dressings and in the means of transportation, the views of military surgeons experienced a change, and the field of conservative treatment of shot fractures of the femur became enlarged. Baudens, who (as indicated in *Note* 4, on page 174, *ante*), in 1836, strenuously advocated

immediate amputation, and who yet, in 1849,[1] insisted that "les fractures du corps du fémur demandent impérieusement l'amputation immédiate," acknowledged, in 1858, after his experience in the Crimean War, "cette sentence trop absolue."[2] The successful attempts at conservation in shot fractures of the femur recorded from the Danish War of 1864, by Heine, from the Six Weeks' War of 1866, by K. Fischer, Beck, and R. Gritti, and from the Franco-German War of 1870–71, by Beck, H. Fischer, Lossen, Rupprecht, and Socin among the Germans, and Chipault, Feltz, Grollemund, Roaldes, Sédillot and others among the French (TABLE XLVIII and notes on p. 336), stimulated the propensity towards conservative opinions in war surgery. B. Beck, who, in 1850, insisted upon immediate amputation,[3] "be it in the field or in cities in well conducted hospitals, in all shot fractures of the femur, even if there be only the slightest splintering or displacement of the ends of the femur in oblique fractures," conceded, in 1872, after the Franco-Prussian War,[4] that "we have, in the field hospitals, by expectative therapy and by the use of the simplest bandages, saved a considerable number of shot fractures of the femur." Sédillot[5] declared that "the extreme mortality of amputations of the thigh in war surgery, and the annoyances and accidents to which the apparatus destined to replace the limb are liable, have led us to renounce this operation in all cases in which the most positive necessity does not require it." Socin[6] considers it "inexcusable to perform in a case of shot fracture of the femur for splintering of bone alone, the primary amputation as yet advocated by the first authorities of French military surgery. Only when we are assured that the vessels, artery and vein, are shot through, is the operation justifiable."

Already in the early part of the War of the Rebellion many American surgeons were

tions, etc., in *Montpellier Médical*, 1872, T. XXVIII, pp. 41–43 (1 recovery, 4 fatal). ROALDES (A. W. DE), *Des fractures compliquées de la cuisse*, Paris, 1871, p. 43, etc. (11 recoveries, 10 fatal). SÉDILLOT, *Du traitement des fractures des membres par armes de guerre*, in *Archives Générales de Médecine*, 1871, 4me sér., T. XVII, p. 423, etc. (25 recoveries). TACHARD (E.), *Reflexions pour servir à l'histoire de la Chirurgie*, in *Gaz. des Hôpitaux*, 1871, p. 238 (1 fatal). VASLIN (L.), *Étude sur les plaies par armes à feu*, Paris, 1872, pp. 102, 244 (7 recoveries, 3 fatal). CHENU (J. C.) (*Aperçu hist. stat. et clinique, etc.*, Paris, 1874, T. II, pp. 153–1038) names 705 pensioners who recovered after shot fractures of the femur; 12 of them have been recorded by the authors just quoted, viz: CHIPAULT (2), CHRISTIAN (2), MACCORMAC (1), FELTZ et GROLLEMUND (2), ROALDES (3), and SÉDILLOT (2), leaving 693 cases to be added to this series, viz: 151 in upper third, 58 in middle third, 110 in lower third, and 374 in which the location of the injury was not specified. MOSSAKOWSKY (P.) (*Stat. Bericht ueber* 1415 *Französische Invaliden*, in *Deutsche Zeitschrift für Chirurgie*, 1872, B. I, p. 342) cites 19 cases of pensioners after shot fracture of the femur not reported by CHENU, viz: 9 in the upper third, 9 in the middle third, and 1 in the lower third of the femur. [49] TILING (G.), *Bericht ueber* 124 *im Serbisch-Türkischen Kriege im Baracken Lazareth des Dorpater Sanitäts-Train Zu Swilainatz behandelte Schussverletzungen*, Dorpat, 1877, pp. 66–69 (1 recovery, 2 fatal). KADE (E.), *Das Temporäre Kriegslazareth des Ressorts der Anstalten der Kaiserin Maria*, in *St. Petersburger Med. Wochenschrift*, 1877, No. 45, p. 384 (4 recoveries, 2 fatal). STEINER (F.), *Aus dem Tagebuche eines Deutschen Arztes während der Zeit des Kriegs im Orient*, 1876, in *Wiener Med. Wochenschrift*, 1877, No. 28, p. 681 (2 recoveries). Of the 3,474 cases of shot fractures of the femur treated by conservation here referred to, 2,132 were successful and 1,242 were fatal, while in 100 instances the result could not be ascertained. But it would obviously be unfair to make a deduction regarding the percentage of mortality from the numbers here adduced. Among the cases of recovery enumerated are 63 pensioners observed by HUTIN (No. 29, *ante*) at the Hotel des Invalides at Paris during the years 1847–1853; 29 pensioners recorded among the Danes after the Schleswig-Holstein War, 1864, by HANNOVER (No. 43, *ante*); 65 pensioners observed by BERTHOLD (No. 47, *ante*); 693 pensioners tabulated by CHENU (No. 48, *ante*); and 19 pensioners observed by MOSSAKOWSKY (No. 48, *ante*). These cases, numbering 869, should be deducted from the total number of recoveries, leaving 1,263 successful to 1,242 fatal cases, a mortality of 49.5 per cent. Of the 869 pensioners thus deducted, 181 recovered after shot fractures in the upper third of the femur, 97 in the middle, 133 in the lower third, and 458 in the femur, third not specified. Deducting these from their respective categories in TABLE XXXVI there remain 489—181=308 recoveries in the upper third to 230 deaths, a mortality of 43.7 per cent.; 296—97=199 recoveries to 148 deaths in the middle third, a death rate of 42.6 per cent.; 307—133=174 recoveries to 125 deaths in the lower third, a fatality of 41.8 per cent., and 1040—458=582 recoveries in the femur, seat unspecified, to 704 deaths, or a mortality of 54.7.

[1] BAUDENS (L.), *Des Plaies d'armes à feu. Communications, etc.*, Paris, 1849, p. 218.

[2] BAUDENS (L.) (*La Guerre de Crimée*, Paris, 1858, p. 131): "Avant la guerre de Crimée, c'était un principe généralement accepté qu'une fracture du fémur déterminée par un coup de feu nécessite l'amputation. Il y a lieu de penser que, grâce à mes nouveaux appareils à fractures, on peut en appeler de cette sentence trop absolue;" and, on p. 333, "Ils prouvent, contrairement à l'opinion reçue, que les fractures comminutives du fémur avec plaie ne sont pas fatalement vouées à l'amputation, si on a le soin d'extraire les esquilles et les corps étrangers pour faire d'une plaie compliquée une plaie simple, et si à l'aide d'un appareil à fracture convenable, on parvient à placer le membre dans une immobilité complète, sans l'ébranler même pendant les pansements, et à donner aux humidités purulentes un facile écoulement."

[3] BECK (B.), *Die Schusswunden*, Heidelberg, 1850, p. 283.

[4] BECK (B.), *Chirurgie der Schussverletzungen*, Freiburg, 1872, p. 691.

[5] SÉDILLOT (*Du traitement des fractures des membres par armes de guerre*, in *Arch. Gén. de Méd.*, 1871, 6me séric, T. XVII, p. 422) remarks: "L'extrême mortalité de l'amputation de la cuisse dans la chirurgie de guerre, et les ennuis et les accidents que causent les moyens de prothèse destinés à remplacer ce membre, nous ont conduit à renoncer à cette opération dans tous les cas où la nécessité la plus évidente ne l'imposait pas. Les ablations partielles ou totales par un boulet, un éclat d'obus; des fracas osseux très-étendus avec division de l'artère, de la veine crurale et du nerf sciatique; la gangrène, les fractures avec large ouverture du genou et fragmentation des condyles du fémur et du tibia, sont les seules complications qui semblent empêcher absolument la conservation de la cuisse."

[6] SOCIN (A.) (*Kriegschirurgische Erfahrungen*, Leipzig, 1872, p. 128) believes that the experiences of the late campaigns confirm on the one hand the previous reports of the enormous mortality of primary amputations of the femur, and, on the other hand, prove that the conservative treatment is not only enabled to save many useful extremities but gives far better results in regard to mortality.

led to similar conclusions. Assistant Surgeon Philip C. Davis, U. S. Army, in a report to the Surgeon General of his services from June 1, 1861, to June 19, 1863, remarked that: "The mortality was very great in cases of amputations for compound comminuted fracture of the femur; better success being met with by using splints and other appliances adapted to the nature of the cases." (See *Appendix to Part I of the Med. and Surg. Hist. of the War of the Rebellion*, p. 15.) Surgeon A. J. Phelps, U. S. V., in his observations after the battle of Chickamauga, September 19, 1863, stated: "As a rule a gunshot fracture of the femur should not be amputated, but should be treated with the expectation of saving the limb. Such appliances should be used as to secure drainage from the wound and comfort to the patient, and the case then be left to nature supported by good air and generous diet." Surgeon J. S. Woods, 99th Ohio Volunteers, in a report from the hospital at Chattanooga, declared: "Amputation is almost never warrantable; but the prospect of success warrants the effort to save the life with the limb." Surgeon Henry J. Churchman, U. S. V., detailed eleven cases of shot fractures of the femur treated at the hospital at Fayetteville, Arkansas, and arrived at the following conclusions: "The results, so far, of the cases given, force me to believe, Guthrie and others to the contrary, that: 1, Gunshot fractures of the femur, as a rule, do not require amputation to save life; 2, As a rule, none should be amputated save those where, in addition to comminution, there is extensive laceration of soft parts or serious injury done to principal artery or nerve or both." Surgeon A. W. Heise, 100th Illinois, who had observed twelve cases of comminuted fractures of the thigh at the first division, Twenty-first Corps, field hospital, "of which six had recovered, two would probably recover, and four had terminated fatally," concludes that "the results of these few cases, so much at variance with the experience of all military surgeons, will be one more reason to encourage a hope for a favorable result from conservative treatment of these unfortunate cases." Like views were entertained by Surgeon I. Moses, U. S. V., Assistant Surgeons A. H. Hoff and DeWitt C. Peters, U. S. A., Assistant Surgeon A. E. Carothers, U. S. V., Acting Assistant Surgeons B. B. Miles, J. Swinburne, E. G. Waters, and the Confederate Surgeon G. M. B. Maughs.[1] That the conservative mode of treating fractures of the femur gave the best results and was most zealously advocated by surgeons in charge of general hospitals remote from the scene of conflict[2] is readily understood when it is considered that

[1] MOSES (I.) (*Surgical Notes of Cases of Gunshot Injuries occurring during the Advance of the Army of the Cumberland*, in *Am. Jour. Med. Sci.*, 1864, Vol. XLVII, p. 338): With our ambulances, "easy and abundant, and the hospitals amply supplied with everything essential . . we were prepared to exert ourselves for the preservation of limbs, and our success has been such as to warrant our efforts." HOFF (A. H.) (*Amputations and Resections—Conservative Surgery*, in *Am. Med. Times*, 1863, Vol. VII, p. 102): "I am heartily tired of amputations, more especially of the thigh, and, with one or two surgeons, have attempted to save limbs as well as lives by calling in Dame Nature and attempting to assist her, and this, I am happy to say, with a success far beyond expectation." PETERS (DEWITT C.) (*Am. Med. Times*, 1864, Vol. VIII, pp. 52, 53) examined 25 cases of recovery after compound fractures of the femur received by Confederate soldiers at the battle of Gettysburg, and remarks: "The general condition of all the men was far above my expectations of finding them, considering they were prisoners of war and liable more or less to nostalgia. . . The treatment they had received was, in my opinion, in conformity with the laws of conservative surgery, yet it seemed to me had a little more care been given to extension or counter-extension, there would have been less shortening and deformity." CAROTHERS (A. E.) (*On Compound Comminuted Fracture of the Femur from Minié Balls*, in *Am. Jour. Med. Sci.*, 1863, Vol. XLV, p. 350, *et seq.*) concludes: "That the operation of resection is not advisable, but that it offers a more favorable prognosis as a primary than as a secondary operation," and advises moderate and regular extension and counter-extension and the use of the anterior wire splint. MILES (B. B.) (*Conservative Treatment of Gunshot Fractures of the Knee-Joint*, in *Am. Med. Times*, 1864, Vol. VIII, p. 50): "In considering the results of gunshot fractures of the femur, the situation of the injury is of vast importance in regard to the chances of recovery, either with or without amputation; as for amputation it has been abandoned, except when large blood-vessels and nerves are implicated." SWINBURNE (JOHN) (*Amputations, when to be performed and when not required in Military Surgery*, in *Am. Med. Times*, 1863, Vol. VI, p. 149): "Excision of the *shaft* is evidently out of the question, since all die after the operation. The question then arises, shall we amputate? Or shall we treat such cases as ordinary compound fractures? I prefer the latter, and have from the first thought it the most reasonable treatment." WATERS (E. G.) (*A Report of Twelve Gunshot Fractures of the Thigh, treated conservatively in the U. S. A. General Hospital "National,"* in *Am. Med. Times*, 1863, Vol. VI, p. 170). MAUGHS (G. M. B.) (*Conservative Treatment of Comp. Comm. Fracture of the Femur, with Cases*, in *Confederate States Med. and Surg. Jour.*, January, 1865, Vol. II, p. 10): "*No excisions of the femur, no incisions of soft parts for the removal* of loose pieces *of bone*, no formidable display of machinery to keep the limb *in* place and the patient *from* sleep. The wounds were carefully examined, and all foreign bodies, including spicula of bone immediately in the track of the ball, removed. . . *As a general rule, ordinary fractures above the knee from rifle balls should never cause primary amputation.*"

[2] Surgeon J. T. HODGEN, U. S. V., on October 17, 1862, reported from the City General Hospital, St. Louis, of shot fractures of the femur, that he "succeeded in saving 37 out of 53 cases admitted," and, in a letter dated April 30, 1863, suggests that "amputation for these fractures should seldom be performed." Surgeon JOHN H. BRINTON, U. S. V., on May 19, 1863, in a report to the Surgeon General U. S. A., on Dr. HODGEN'S cradle splint, takes

cases reaching these hospitals had been generally selected by the surgeons in the field as cases in which there existed some chance of saving the limb.

But while many of the American surgeons advocated and practised conservative measures in shot fractures of the thigh, there were those who deprecated the frequent attempts at conservation, and who were of the opinion expressed by Surgeon S. Hart, U. S. V.,[1] that "more amputations would have saved more lives." Surgeon T. H. Squire, 89th New York Volunteers, wrote in 1862, after the battle of Antietam: "A badly shattered femur by a ball through the thigh should always be amputated, and the quicker the better." Surgeon G. D. Beebe, U. S. V., in his report of the centre division of the Fourteenth Corps, at the battle of Murfreesboro', remarked: "In the shaft of the femur I believe amputation is the true conservative course." Surgeon G. A. Collamore, 100th Ohio Volunteers, declares: "In fractures affecting the lower two-thirds of the limb, I should amputate so as to remove the fractured portion;" and Surgeon H. S. Hewit,[2] U. S. V., Medical Director of the Army of the Ohio, reported, in September, 1864: "Compound comminuted fractures of the thigh were almost invariably amputated primarily when reaction took place." Surgeon F. Sorrel,[3] Inspector of Hospitals of the Confederate States Army, also favored primary amputation on the field as "the greater readiness with which the patient can be transported from the field; the greater ease and comfort realized under these circumstances, when the limb has been removed; the lesser time required in hospital for recovery, would all seem to point to its adoption as the wiser policy."

Reviewing the cases of injuries and operations in the shaft of the femur recorded during the American civil war, it cannot be denied that the results of the conservative mode of treatment as well as of the amputations have been very gratifying. The three thousand four hundred and sixty-seven cases of the former group gave a mortality of 49.9 per cent., while, of the six thousand two hundred and twenty-nine cases of the latter group, 53.8 per cent. were fatal. Less favorable were the results of excisions in the shaft of the femur, which exhibited a mortality of 69.4 per cent. in the one hundred and seventy-five cases of this operation recorded on the registers of this Office. Of the six thousand two hundred and twenty-nine amputations of the thigh it is true only two thousand nine hundred were performed for shot fractures of the femur, while the remaining three thousand three hundred and twenty-nine were done for shot fractures of the knee joint, leg, or foot, and the objection may be made that it would be unfair to compare the results of six thousand two hundred and twenty-nine amputations in the thigh with the results of shot fractures of the femur treated by either conservation or excision, the injuries in all these cases being in the femur; but the mortality of the two thousand nine hundred amputations in the thigh for fractures of the femur, with one thousand two hundred and fifty-seven

issue with the latter suggestion: "I think that neither an examination of gunshot injuries of the thigh made on the battle-field, nor of the study of the pathological specimens in the Army Medical Museum, will sustain this view of Dr. HODGEN. It must, moreover, be remembered that the cases submitted to the treatment of this surgeon are cases which have reached him at advanced periods after the reception of the injuries; that they have been selected by the surgeons at the scene of conflict as cases in which there existed some chance of saving the limb. They were forwarded to St. Louis for that purpose, and not for amputation. Were the worst cases sent him, I doubt much if his results would be as encouraging." From his experience, based upon the cases treated by him at the Stewart Mansion Hospital, Baltimore, Assistant Surgeon DE WITT C. PETERS, U. S. A., reported, in 1863: "My experience in the treatment of compound fractures of the thigh caused by gunshot wounds and by other kinds of violence has inclined me to favor the most conservative course of action. In cases where the large and important blood-vessels and nerves have escaped injury, and where there is not any extensive laceration and destruction of the soft parts, when the constitutional symptoms are not alarming, the true indications are, it appears to me, to try and save the limb. Instances where, by chance or accident, the surgeon has not seen the case in time to perform primary amputation, and has left nature to her own powerful efforts, which have been finally crowned with success, are by no means infrequent, and these instructive cases should not, in my judgment, be overlooked in forming our opinions in deciding whether a limb should be sacrificed or not."

[1] *Appendix to Part I of the Medical and Surgical History of the War of the Rebellion*, p. 118.

[2] *Appendix to Part I of the Medical and Surgical History of the War of the Rebellion*, p. 311.

[3] SORREL (F.), *Gunshot Wounds—Army of Northern Virginia* [*An Extract from a Report on the Sickness and Mortality in the Armies of the Confederate States, for* 1863, in *Confederate States Medical and Surgical Journal*, Richmond, 1864, Vol. I, p. 154.

recoveries, one thousand five hundred and sixty-three deaths, and eighty unknown results, or 55.4 per cent., exceeds that of the total number of amputations (53.8) only 1.6 per cent., leaving the relative results nearly the same—the percentage of fatality of the total number of amputations, and that of the amputations for fractures of the femur, exceeding the fatality of the conservatively treated cases 3.9 per cent. and 5.5 per cent. respectively. But it is obvious that in comparative statements of cases treated by conservation and by amputation the majority of intermediary and secondary operations should be considered only an abandonment of the conservative treatment made necessary by subsequent complications. To arrive, therefore, at a correct estimate of the value of conservation, we must contrast the latter with the primary operations; and here it will be noticed that while the conservative cases presented a fatality of 49.9 per cent., the mortality of the primary amputations was 49.8 per cent., the latter offering a slightly better chance for the preservation of life.[1]

In comminuted fractures of the upper third of the femur surgeons generally considered conservation preferable to amputation. Professor F. H. Hamilton[2] gave it as his impression that "in compound gunshot wounds of the upper third of the femur amputation should never be performed." Surgeon Charles O'Leary,[3] U. S. V., found, during the Peninsular campaign in 1862, that "amputations at the upper third of the thigh proved fatal within a short time in all cases. The results of this operation were such as to dissuade us from resorting to it in subsequent battles, except when a limb was in such a condition as to make its removal a relief to the patient." Surgeon G. A. Collamore,[4] 100th Ohio Volunteers, who advised primary amputation in shot fractures of the middle and lower thirds of the femur, declares that "if the fracture occur in the upper third, I should prefer to trust the case to nature, with such aid from position, splints, etc., as could be obtained." Surgeon J. J. Chisolm,[5] Confederate States Army, declares that "A compound fracture in the upper third of the thigh should be treated, in every respect, as if in the arm. Unless the leg is so mangled that an amputation is an act of necessity, it should not be thought of." That these views largely prevailed among the surgeons of the War of the Rebellion is apparent from a comparison of the number of cases of shot fractures of the upper third of the femur treated by amputation with those treated by conservation. In fifteen hundred and seventy-seven of the twenty-nine hundred amputations for shot fractures of the femur the precise seat of the injury was recorded. Of these fifteen hundred and seventy-seven cases the injury was in the upper third in only ninety-three instances, or 5.8 per cent., while in two thousand seven hundred and twenty-nine of the three thou-

[1] Professor TH. BILLROTH (*Chirurgische Briefe aus den Kriegslazarethen in Weissenburg und Mannheim*, 1870, Berlin, 1872, p. 239) contends that the intermediary and secondary operations should be grouped with the conservation cases, and this result compared with that of the primary operations:

MODE OF TREATMENT.	CASES.	RECOVERY.	FATAL.	UNKNOWN.	MORTALITY.
Conservation	3,467	1,689	1,684	94	49.9
Excisions (Intermediary and Secondary)	67	24	42	1	63.6
Amputations (Intermediary and Secondary)	1,762	718	1,044	.....	59.2
Aggregate	5,296	2,431	2,770	95	53.2

or a fatality of 53.2 per cent. for conservation against 49.8 for primary amputation.

[4] SMITH (STEPHEN), *Analysis of Four Hundred and Thirty-nine Recorded Amputations in the Continuity of the Lower Extremity*, in *United States Sanitary Commission Memoirs*, 1871, Vol. II, p. 62.

[5] CHISOLM (J. J.), *A Manual of Military Surgery*, Columbia, 1864, p. 394.

sand four hundred and sixty-seven cases treated by conservation, in which the locality of the injury was ascertained, twelve hundred and fifty-four, or 46 per cent., or nearly one-half, were for fractures in the upper third of the femur. The number of amputations for fractures in the middle third of the femur was three hundred and sixty, and for fractures in the lower third eleven hundred and twenty-four, while of the cases treated by conservation those for fractures in the middle third numbered eight hundred and fifty-five, and those for fractures in the lower third only six hundred and twenty.

Ribes,[1] Demme,[2] Pirogoff,[3] and others[4] have called attention to the great fatality following shot fractures in the middle third of the femur, and Surgeon E. Andrews,[5] 1st Illinois Artillery, reports to have had a similar experience. But neither the results of the cases treated in the American civil war (TABLE XX, p. 175, *ante*) nor of the cases collected in TABLE XLVIII, on p. 336, appear to confirm this opinion. In the former the percentage of fatality is 46 per cent. for fractures in the upper third, 40.6 per cent. for fractures in the middle third, and 38.2 per cent. for fractures in the lower third. In the latter the fatality is 43.4 per cent. for the upper third, 43.1 per cent. for the middle, and 42.3 per cent. for the lower third, thus affirming, in shot fractures of the femur at least, the old axiom that the gravity of injuries of the extremities steadily augments in proportion as the seat of the injury approaches the trunk.

When it had been decided in a shot fracture of the femur to attempt preservation of the limb, all loose spiculæ and foreign bodies were carefully removed,[6] the limb was then brought as near as possible to its normal position, and there held by the use of splints. The extraction of splinters retaining any connection by the periosteum, and also the practice of cutting off the broken ends of the bone, was generally deprecated.[7]

---

[1] RIBES (F.) (*Mémoire sur la fracture du tiers moyen du fémur compliquée de plaie, et produite par arme à feu*, in *Gazette Médicale de Paris*, 1831, T. II, No. 12, p. 101) asserts: "Toutes les fractures du fémur compliquées de plaie, produites par un corps poussé par la poudre à canon sont des maladies graves; mais celles qui arrivent au tiers moyen de cet os sont extrêmement dangereuses et presque toujours mortelles."

[2] DEMME'S (H.) (*Militär Chirurgische Studien*, Würzburg, 1861, p. 262) tabulations show a similar result in the Italian War of 1859; the mortality of fractures in the middle third of the femur being 60.87 per cent. to 58.14 of the upper and 43.42 of the lower thirds.

[3] PIROGOFF (N.) (*Grundzüge der Allgemeinen Kriegschirurgie*, Leipzig, 1864, pp. 783, 784) remarks that in the hospitals in the Caucasus and after the Crimean War he saw 20 cases of recovery after shot fractures of the upper third of the femur, but no cases of recovery after fractures of the middle third, and adds: "Our own efforts—comparatively few in comparison to the number of amputations—to cure shot fractures of the middle third of the femur, miscarried."

[4] FISCHER (H.) (*Kriegschirurgische Erfahrungen*, Erlangen, 1872, p. 178) analyses twenty cases of fracture of the femur that were treated by him during the Franco-Prussian War, 1870–71: 10, with 6 deaths, or 60 per cent. mortality, were in the upper, 5, all fatal, were in the middle, and 5, all recoveries, were in the lower third; and reaches the conclusion: "That shot fractures in the middle third are the most dangerous, and are least adapted to conservative treatment. I believe, therefore, that it would be best to amputate primarily in extensive comminuted fractures of the middle third, and to attempt conservative treatment only in shot fractures with little splintering. Stress should be laid upon this rule, as especially to-day, too little primary amputating is done. Primary amputation for shot fracture of the femur is considered almost a crime. . . It is altogether different in shot fractures of the lower third of the femur; here the conservative treatment promises the best results. Between the two stand the results of shot fractures in the upper third. There the amputation or exarticulation is, under all circumstances, a dangerous proceeding, and we may, therefore, allow the conservative treatment a larger field." BECK (B.) (*Chir. der Schussverletzungen*, 1872, p. 694) remarks: "Fractures of the middle third of the femur near the junction with the upper third always impressed me most unfavorably, on account of the frequently co-existing injuries of the blood-vessels."

[5] ANDREWS (E.) (*Complete Record of the Surgery of the Battles fought near Vicksburg. December* 27, 28, 29, 30, 1862, Chicago, 1863, p. 37): "It would seem that shots through the cancellar tissue, at the superior fifth of the femur, are much less dangerous than those in the compact bone of the shaft below; the reason is, that when a ball bores its way through spongy bone, it produces only a moderate amount of shattering, owing to the yielding character of that tissue; but the impact of a minié bullet upon the brittle ivory of the shaft shatters it for several inches, and disperses the fragments with the force of an explosion among all the surrounding tissues, producing immense disorganization. These cases nearly all die within the first five days, no matter what treatment is adopted."

[6] The records show that fragments of bone were dislodged in 288 instances at least, of which 170 had successful terminations.

[7] Surgeon A. W. HEISE, 100th Illinois, who observed twelve cases of comminuted fractures of the thigh at the 1st division, Twenty-first Corps, field hospital, of whom six had recovered with union, two would probably recover, and four had terminated fatally, remarks, in a communication to the Medical Director of the Twenty-first Corps, dated February 4, 1863: "In all these cases the principal vessels had escaped injury. Primary sequestra, or those directly and completely separated by the force of the projectile, were carefully removed by making a liberal incision over the parts. But sequestra retaining connection by periosteal, muscular, or other attachment, I did not interfere with. In only two cases I found that during the process of suppuration sequestra were thrown off. In the majority of these comminuted compound fractures I find that the removal of splinters retaining any connection with periosteum is unnecessary and often injurious, as is also, in my opinion, the practice of sawing off the broken ends of the bones projecting from the comminuted parts. I am strengthened in the belief, from observation made here, that by proper treatment, and under favorable circumstances, splinters become impacted in callus, and, in time, unite with the other fragments of the bone, and, in this manner, a cure is completed without operative interference. Whether the splinters which have thus become impacted in callus will lead to mischief, or are subsequently discharged as if they were so many foreign bodies, the future will determine." Surgeon A. J. PHELPS, U. S. V., in his observations after the battle of Chickamauga, recommends that "loose spicula only should be removed, and resections of the shaft be eschewed." Surgeon H. S. HEWIT, U. S. V., in his *Report on the Military Med-*

The plans adopted for the mechanical support of the fractured thigh bone, for maintaining proper extension, for retaining the fractured ends in accurate apposition, and for facilitating the necessary dressings, during transport as well as in hospitals, were manifold and ingenious, and doubtless contributed to the success achieved in the saving of useful limbs. The extended position, which may be traced back to Hippocrates,[1] but for the systematic and rational application of which we are indebted to Desault,[2] as well as the

icine, Surgery, and General Conduct of the Medical Department of the Army of the Ohio, from May, 1, 1864, to September 8, 1864 (*Appendix to Part I, Med. and Surg. Hist. of the War of the Rebellion*, p. 311), declares "the principle of removing fragments primarily when detached is obvious and has been recommended to the surgeons of the department." Surgeon W. W. BLAIR, 58th Indiana, in *Report of the Medical Staff of the 1st division of the Twenty-first Corps, at the Battle of Stone's River* (*Appendix to Part I, Med. and Surg. Hist. of the War of the Rebellion*, p. 263), states that "all fragments of bone completely separated by the force of the projectile were carefully removed by making an incision if necessary; but fragments retaining connection by the periosteum were not removed, and in only two cases were sequestra thrown off during the process of suppuration." Surgeon HENRY J. CHURCHMAN, U. S. V., in charge of the hospital at Fayetteville, Arkansas, insists that "the comminuted fragments, if small and detached, should in all cases be removed at once under chloroform, and the thigh put in splints so as to keep parts in proper apposition and invite callus—the amount of extension or counter-extension to be regulated by the amount of comminution or loss of substance. It seems to me that the inflammation and suppuration necessitated by an unreduced compound comminuted fracture detach the periosteum from fragments, and not from fragments alone but from bone generally, while the system wastes from suppurative exhaustion and pyæmia. Should even a useless limb result from effort to save, amputation could subsequently be performed under far more favorable circumstances than are generally found in the crowded wards of a general hospital."

[1] HIPPOCRATES, *Oeuvres complètes par* É. LITTRÉ, Paris, 1841, T. III, *Des Fractures*, Par. 19, p. 483.

[2] DESAULT (P. J.) (*Oeuvres chirurgicales*, éd. par XAVIER BICHAT, Paris, 1813, T. I, p. 249, and PLATE II) employed a straight outer splint to reach from the hip to some distance beyond the foot; an inner splint extending from the perinæum and terminating opposite the end of the outer splint; an anterior splint reaching from the abdomen to the knee; and an extending and counter-extending band, the former secured to the foot and lower extremity of the long splint, the latter to its upper extremity after being passed under the perinæum. Junkbags and the SCULTETUS bandage completed the apparatus (see FIG. 207). H. J. BRÜNNINGHAUSEN (*Ueber den Bruch des Schenkelbeinhalses überhaupt, und insbesondere eine neue methode, denselben ohne Hinken zu heilen*, Würzburg, 1789) fastened the broken thigh to the sound one, a principle followed by HAGEDORN (M.) (*Abhandlung von dem Bruch des Schenkelbeinhalses, nebst einer neuen Methode, denselben leicht und sicher zu heilen*, Leipzig, 1808) in his apparatus, which makes the sound limb the extending power, both feet being secured to the foot-board, and the splint to the sound thigh. The apparatus was extensively used on the continent of Europe as well as in England, and was considered a most simple and effectual apparatus. To obviate the principal objection to DESAULT'S splint, that it does not act in the line of the axis of the broken limb, but obliquely, drawing the upper fragment outwards, PHILIP SYNG PHYSICK (JOHN SYNG DORSEY, *Elements of Surgery*, Philadelphia, 1813, Vol. I, p. 163) lengthened the outer splint (see FIG. 208) until it reached nearly to the axilla, and attached to its inner side, at about two inches above its lower end, a block grooved on its inner margin, and broad enough to reach the line of the middle of the foot. Counter-extension was thus made more in the line of the body. If the patient experienced any difficulty in bearing pressure upon the top of the foot, Dr. PHYSICK used a buckskin gaiter laced around the ankle, with straps for extension. Dr. HUTCHINSON added a notched block, over which the extending band is stretched, throwing the direction of the extension in the line of the limb. The apparatus of BRÜNNINGHAUSEN as well as of HAGEDORN prevented the lateral movements of the pelvis. This defect was partially overcome by WILLIAM GIBSON, of Philadelphia (*Reflexions on the Treatment of Fractures of the Thigh, with an Account of a New Apparatus*, in the *Philadelphia Jour. of the Med. and Phys. Sciences*, 1821, Vol. III, p. 230, etc.), who, in a case of oblique fracture of the femur, had applied DESAULT'S splint; but, owing to the obesity of the patient, found it impossible to keep up extension and counter-extension sufficient to prevent the overlapping of the fractured ends of the bone, and tried the method of HAGEDORN: "I soon found, however, that simple and ingenious as it was, and calculated to effect extension and counter-extension to a much greater degree than that of DESAULT, that it was still imperfect, but susceptible of such changes as would make it a most valuable acquisition." Dr. GIBSON constructed two splints five and a half feet in length, reaching from the axilla beyond the feet. Both feet were confined by gaiters to a foot-board, which was firmly supported upon the ends of the long splints through mortises near its edges. But as both feet are imprisoned, the confinement is apt to become irksome to the patient, and it is difficult to prevent bedsores, to give the patient a stool, or to use a urinal. Subsequently, Dr. GIBSON recommended (*Philadelphia Journal of Med. and Physical Sci.*, 1822, Vol. V, p. 372) a triangular frame presenting a single inclined plane, on which both extremities were extended; the feet were confined to a foot-board, and counter-extension was made by the weight of the body. In a similar manner Dr. E. MICHENER (*Remarks on the Treatment of Fractures of the Femur*, in the *American Medical Recorder*, 1822, Vol. V, p. 430) raised the limb on a single-inclined plane to receive counter extension by the weight of the body. A further modification of DESAULT'S splint was that of LUKE HOWE (*Observations on the various methods of treating the fractures of the Os Femoris, with Cases, in which a new apparatus was successfully used*, in *The New England Journal of Medicine and Surgery*, 1824, Third Series, Vol. III, p. 234). The extension was made at the foot with weight and pulley; counter-extension by a band over the groin and ischium, connected by a strap with the headboard of the bed, and a waist band was buttoned or sewed on the pelvis and fastened to the side pieces of the bedstead by bandages or tape. The pulley and weight was also employed by WILLIAM C. DANIELL (*Method of Treating Fracture of the Thigh Bone*, in *Am. Jour. Med. Sci.*, 1829, Vol. IV, p. 330) attached to a handkerchief passed around the ankle. BOYER'S splint (*Traité des Maladies Chirurgicales et des Opérations qui leur conviennent*, Paris, 1831, T. III, p. 305, and Pl. III, opposite p. 640) is composed of a long splint for the external side of the limb, with a foot-board, which was moved up and down by means of a screw for the purpose of making extension; of an inside splint from the perinæum to the foot, and of an anterior splint reaching from the groin to the ankle. A padded leather band through the perinæum and buckled into the upper end of the outer splint made the counter-extension. A modification of BOYER'S DESAULT was used by Dr. JOSEPH E. HARTSHORNE, of Philadelphia. The counter-extension was made against the perinæum at the upper end of the inside splint, and both splints were connected at the lower end by a transverse piece through which a long wooden screw passed having a foot-board attached to it. By this arrangement the outer splint could be detached from the inner one without disturbing either the extending or counter-extending force. The splint is figured, after nature, by H. H. SMITH (*The Principles and Practice of Surgery*, Philadelphia, 1863, Vol. I, p. 625). LISTON'S modification of DESAULT (R. LISTON, *Practical Surgery*, London, 1840, p. 88) consists of a straight splint from the axilla to about six inches below the foot, perforated with two holes at the upper extremity and with two deep notches in the lower end, and an opening to receive the external malleolus. The perineal band is tied to the upper end of the splint; the foot is secured to the processes at the lower end of the splint by a roller passing from one to the other, and then junkbag,

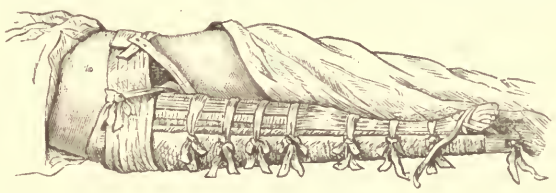

FIG. 207.—DESAULT'S splint.

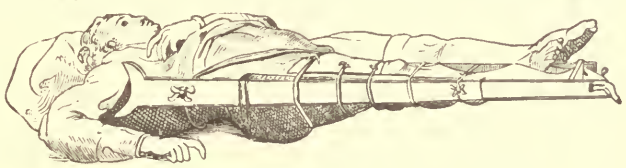

FIG. 208.—PHYSICK'S modification of DESAULT'S splint.

semiflexed position, which was brought into practice chiefly by Percival Pott, found their advocates, although the former was perhaps better known to American surgeons through its modifications by Physick, Gibson, and others. An apparatus on the plan of the double-

splint and thigh are all bound together by continuing the roller up the limb. The apparatus keeps up a moderate extension and counter-extension. The splint employed by W. E. HORNER, of Philadelphia (H. H. SMITH, *The Principles and Practice of Surgery*, Philadelphia, 1863. Vol. I, p. 627) is similar to PHYSICK'S, but the upper extremity of the inside splint is slightly carved out like a crutch head, and has stretched across it a soft leather strap. On the inside of the upper portion of the splint two leather loops are nailed to serve for the attachment of the counter-extending band. Extension was made by adhesive strips. The mode of making extension by adhesive strips and weight is said to have been first employed by Dr. JOSEPH SWIFT, of Easton, Pennsylvania. It was suggested, in 1843, by Dr. ENNIS, a pupil of Dr. SWIFT, to Dr. E. WALLACE, of Philadelphia, and was by the latter successfully employed in a case of simple fracture of the thigh (WM. HUNT, *Extracts from Clinical Lectures*, in *Pennsylvania Hospital Reports*, 1869, Vol. II, p. 273). The same mode was employed by Dr. FREDERICK D. LENTE in 1851, in the New York Hospital (F. D. LENTE, *A statistical and critical Account of the Fractures occurring in the New York Hospital, etc.*, in *New York Jour. of Med.*, 1851, Vol. VII, p. 179). It consisted in the employment of broad strips of adhesive plaster (2½ or 3 inches), which were applied to the limb previously shaved, on either side of it, from a little above the knee to below the foot, where it was secured to the ring at the end of the screw. The straps are confined by a single roller bandage. To prevent slipping of the plaster the extension is not applied until some hours after the application of the strips to the limb. In 1853, Dr. JOSIAH CROSBY (*New Mode of Extension in Fractures*, in *Am. Jour. Med. Sci.*, 1854, Vol. XXVII, p. 76) published a description of his mode of procuring extension by adhesive strips, which he "used, for the first time, in 1849," and which he believed had never been suggested to the profession in a manner to attract the attention of surgeons until it appeared in Professor MUSSEY'S Surgical Report to the American Medical Association at their session in 1850 (*Transactions of the Am. Med. Association*, 1850, Vol. III, p. 382). Dr. D. GILBERT (*Cases in Surgery*, in *Am. Jour Med. Sci.*, 1851, N. S., Vol. XXI, p. 70) substituted a movable for HUTCHINSON'S permanent block, which he attached to the straps of a common tourniquet, close to the sole of the foot, placing the instrument upon the distal side of the block and regulating the extension by the screw of the tourniquet, using adhesive plaster as a counter-extending bandage. Similarly, JOHN NEILL (*New Means for making Extension and Counter-Extension in Fractures of the Leg and Thigh*, Philadelphia, 1855, p. 4) made counter-extension by means of adhesive plaster. The ends of the extending and counter-extending strips were carried through their respective holes at the upper and lower ends of the splint and secured to each other about the middle of the outer splint. By twisting these united bands by a small stick the extension could be increased and maintained. J. McF. GASTON (*Counter-Extension with Adhesive Plaster*, in *Southern Med. and Surg. Jour.*, 1859, N. S., Vol. XV, p. 672) adapts adhesive plaster to counter-extension in the manner of GILBERT, but claims superiority in this, that he makes the attachment of the strips over the spinous process of the ilium and the trochanter, thus giving more fixed resistance to the force of extension. Dr. L. A. DUGAS (*On the Best Plan of Treating Fractures in Country Practice*, in *Southern Med. and Surg. Jour.*, 1854, Vol. X, p. 69) employs 4 wooden splints, a little shorter than the femur, secured around the thigh with many-tailed bandages, a long splint from the side of the thorax to a little below the foot secured by separate ties around the abdomen, pelvis, thigh, leg, and foot, a weight fixed to the ankle and hung over the foot-board, and an arch of crossed hoops to protect the toes from the bed clothes. Dr. H. LENOX HODGE (*Counter Extension in Fractures of the Femur*, in *Am. Jour. Med. Sci.*, 1860, N. S., Vol. XXXIX, p. 565) devised a modification of PHYSICK, with adhesive strip extension and counter-extension. He dispenses with the perineal band, and prevents the patient from rising or sitting during treatment by a piece of iron attached to the long splint which extends over the patient's shoulder, terminating in a blunt hook. A broad piece of adhesive plaster placed on the front and back of the chest, and secured by strips around the body, is looped over a small block of wood which is attached to the hook at the end of the metal bar, thus making counter-extension. To prevent excoriation or sloughing in parts under pressure, the groin, or the perinæum and the ankle, Dr. B. E. COTTING (*Simple Apparatus for Fractures of the Thigh*, in the *Boston Med. and Surg. Jour.*, 1861, Vol. LXV, p. 129, etc.) recommends a band of stout cotton or linen cloth made to fit the pelvis and upper part of the hips closely, and a stocking on the leg, with side straps of strong cotton cloth, which should hang free for a few inches below the foot. By these straps extension is made on the DESAULT splint, the whole leg being brought down with great steadiness, and without the slightest danger from undue pressure on any particular portion. Dr. J. H. PACKARD (*On the Employment of India-Rubber in obtaining Continuous Extension in the Treatment of Fractures of the Femur*, in *Am. Jour. Med. Sci.*, 1862, Vol. XLIV, p. 90) added to the inner and lower end of PHYSICK'S long outer splint a pulley, through the groove of which he ran an India-rubber cord, secured to the leg and ankle by adhesive plaster. The rubber cord was drawn until a sufficient degree of tenseness had been obtained, when the end was tacked to the outer side of the long splint. Two or three inches of the India-rubber cord should be free between the adhesive plaster and the pulley in order to make the elastic force operative. A similar apparatus is figured by R. BARWELL (*A Treatise on Diseases of the Joints*, London, 1865, p. 266, etc.). Dr. T. H. BACHE (F. W. SARGENT, *On Bandaging and other Operations of Minor Surgery*, Philadelphia, 1862, p. 179) cut a long narrow fenestrum in PHYSICK'S outer splint, extending upwards from near its lower extremity; in this fenestrum slides an iron arm, capable of being firmly fixed by screw clamps at any point, so as virtually to lengthen or shorten the splint in adaptation to limbs of different lengths. An ingenious apparatus is described and figured by Dr. HENRY N. HEWIT (*Original Adaptation of Received Principles of Treatment in Fracture of the Thigh*, in *The Medical Record*, 1868–69, Vol. III, p. 217): "It consists of two light flat lateral bars of steel connected by a cross-bar below the sole of the foot. The exterior bar or splint extends from its angle with the cross-bar, six or eight inches below the foot, to the side of the chest opposite the nipple. Two flat bands of steel well padded secure it to the chest and body. The inner bar reaches nearly to the perinæum, but does not impinge, and the floor of the splint is of flexible metal, carefully padded by a continuation of the bands, which secure it to the limb and buckle in front. The two lateral bars opposite the thigh are fenestrated, and nuts are inserted capable of sliding longitudinally, through which play the screws, which can be used for the exact application of detached moulded metallic 'splints of coaptation.'"

[1] POTT (PERCIVAL) (*Chirurgical Works*, Dublin, 1778, Vol. II, p. 304) ascribed the cause of the retraction of the bone in fractures of long bones to the tension of the muscles: "In the thigh, the case is still more obvious, as the muscles are more numerous and stronger. The straight posture puts the majority of them into action, by which action that part of the broken bone which is next to the knee is pulled upward, and by passing more or less underneath that part which is next to the hip, makes an inequality or rising in the broken part, and produces a shortness of the limb." He discarded all machinery for extension in use, and relied on the relaxation of the muscles by placing the knee "in a middle state, between perfect flexion and extension," supporting the leg and foot by smooth pillows, and inclining the patient's whole body to the outside of the fractured femur. The same position was recommended by ROBERT WHITE (*The Present Practice of Surgery*, London, 1786, p. 147) in fractures toward the middle or lower part of the thigh bone, in "order to moderate the subsequent tension; but as soon as the swelling and tightness of the muscles are subsided, the limb should be carefully and gradually brought down, and the toe, knee, and groin kept in a direct line with each other." A double-inclined plane suspended by ropes and cross-bar from a ring was advised by J. N. SAUTER (*Anweisung, die Beinbrüche der Gliedmassen, vorzüglich der complicirten, und den Schenkelhalsbruch nach einer neuen, leichten, einfachen und wohlfeilen Methode ohne Schienen sicher und bequem zu heilen*, Konstanz, 1812). The apparatus is figured by MATTHIAS MAYOR (*Bandages et Appareils à Pansements ou Nouveau Système de Déligation Chirurgicale*, Paris, 1838, 3me éd., PL. 11, FIG. 72). Sir ASTLEY COOPER (*Surgical Essays by* ASTLEY COOPER *and* BENJAMIN TRAVERS, London, 1819, Part II, p. 49, and FIG. 5 of PLATE VIII) placed the patient on his back, brought the thigh over a double-inclined plane composed of three boards, one below to reach from the tuberosity of the ischium to the patient's heel, and the two others above, with a joint in the middle by which the knee may be raised or depressed. Sir ASTLEY COOPER, who had employed this double-inclined plane for near twenty years, ascribed its construction to Mr. WHITE, of Manchester, "who had one made of iron, and hollowed to adapt it to the form of the leg and thigh, but this machine was too heavy and too complicated for use. Mr. JAMES, of Hoddesdon, improved upon Mr. WHITE'S idea, by having the instrument made of wood, with movable splints upon the sides." CHARLES BELL (*Observations on Injuries of the Spine and of the Thigh Bone*, London, 1824, p. 45) also placed the patient on his back instead of the side as advised by POTT: "It is now about eighteen years since I have been accustomed to show the application of the double-inclined plane to fractures of the thigh bone, that it relaxes the muscles inserted into the inner trochanter, and at the same time relaxes all the muscles on the back part of the thigh by the bending of the knee; in short, that it

inclined plane of Pott, introduced, in 1854, by Professor N. R. Smith,[1] and known as Smith's anterior splint, was largely employed in shot fractures of the femur in the early part of the war, the reports indicating that it was used in at least two hundred and eighty-eight instances. Surgeon J. T. Hodgen, U. S. V., in charge of the City General Hospital, St. Louis, forwarded,

humours the natural position of the limb; and that instead of having to restrain and bring down the upper portion, the lower part is raised to correspond with it." The apparatus is figured on p. 346 of Vol. II of C. BELL'S *System of Surgery*, London, 1841, and is copied in the adjoining wood-cut (FIG. 209). A modification of BELL'S apparatus by J. AMESBURY (*Observations on the Nature and Treatment of Fractures of the Upper Third of the Thigh Bone*, London, 1828, p. 132) was found objectionable on account of its cost and complicated character. It consists of three parts, exclusive of straight splints and straps: one part for the thigh, one for the leg, and the third for the foot. The thigh plane again consists of two pieces arranged to make the upper part of the plane conformable to that of the thigh. Hinge joints connect the thigh and leg pieces, and the foot-board is fitted upon the leg plane by means of a screw, allowing it to be moved at a greater or less distance from the angle of the two planes. A steel rod connects the two planes underneath, by which the angle of the plane may be altered at pleasure. The apparatus can only be prepared by the manufacturer. The apparatus of MATTHIAS MAYOR (*loc. cit.*, p. 6, and PL. 10, FIGS. 66, 67, and 68) consists of two planes made of wire and connected by a hinge, with cords to suspend the limb from the bed or ceiling. In 1828, NATHAN SMITH (*Observations on Fractures of the Femur, with an Account of a New Splint*, in *The Philadelphia Monthly Journal of Medicine and Surgery*, 1828, Vol. II, p. 51) perfected an apparatus similar in principle to AMESBURY'S but of simple construction and material. It consisted of two thin broad pieces of bass wood, so warped that the concavity of one corresponded to the convexity of the under surface of the thigh, and the other to that of the leg. Both were joined by hinge-like rivets. A strap passing from the upper extremity of the thigh-piece to the lower extremity of that of the leg, allowed the limb to be fixed at any angle. His son, NATHAN R. SMITH (*Description of an Apparatus for the Treatment of Fractures of the Thigh and Leg*, in *The Baltimore Monthly Journal of Medicine and Surgery*, 1830, Vol. I, p. 305), substituted for bass wood thick binder's board, which he slightly moistened with wetted sponge and shaped into a semi-cylindrical form with the hand. To meet certain requirements, which N. R. SMITH deemed indispensably necessary in the treatment of fractures of the femur (*Observations on Fractures of the Thigh and Leg; with a Description of an Apparatus applicable to the treatment of such injuries*, in *Baltimore Medical and Surgical Journal*, 1833, Vol. I, p. 13), he devised, in 1833, a new apparatus, consisting of four pieces, viz: two concave planes, the one adapted to the inferior surface of the thigh, the other to that of the leg. These are united by a hinge corresponding to the knee. The third piece is for the foot, and the fourth is connected with the thigh piece, and extends upward beside the body. To allow the patient to change his position, Dr. SMITH suspended the limb by means of a cord attached to some fixed point, as already indicated by SAUTER and MAYOR. In LONSDALE'S apparatus (E. F. LONSDALE, *A Practical Treatise on Fractures*, London, 1838, p. 295) the thigh and leg planes were joined at a point corresponding to the knee by a hinge. A horizontal plane, joined also by a hinge to the upper part of the thigh plane, was serrated at the foot end, allowing the leg plane to be fixed at any angle. This simple apparatus was very generally used in the Middlesex Hospital, London. JOSIAH C. NOTT (*Description of a Modification of the Double Inclined Plane, with an exposition of its advantages over other apparatus for fractures of the lower extremity*, in *Am. Jour. Med. Sci.*, 1839, Vol. XXIII, p. 21) describes and figures an apparatus similar to LONSDALE'S, with the addition of a foot-board. Three narrow slits are cut through on each side of the thigh plane, two inches from the edges. Through these are drawn leather straps, long enough to pass around the limb after the pads and splints are applied. By means of buckles at the end of the leather straps the limb is firmly secured to the plane. The apparatus of MCINTYRE, of Newcastle (WM. FERGUSSON, *A System of Practical Surgery*, London, 1842, p. 282), is better known in its simplified form by R. LISTON (*Practical Surgery*, London, 1840, p. 96). It consists of a foot-board of wood, and a thigh and a leg piece of sheet-iron made to fit the limb, and capable of being elongated, by means of screws, to suit any limb, or of being adjusted to any angle. A cross plate of iron is attached to the foot end of the apparatus, which is so arranged that it will always rest flat on the bed, whether the limb be raised or depressed.

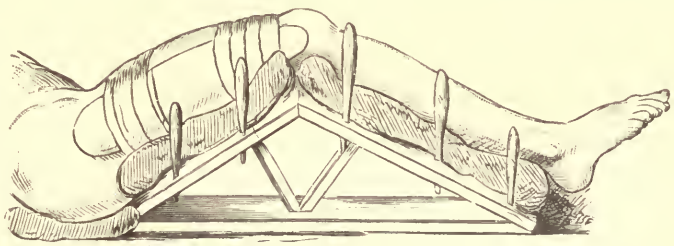

FIG. 209.—Double-inclined plane of C. BELL. [After BELL.]

[1] SMITH (N. R.), *A New Instrument for the Treatment of Fractures of the Lower Extremities*, in the *Maryland and Virginia Medical Journal*, January, 1860, Vol. XIV, p. 1, and *The Anterior Suspensory Apparatus for the Treatment of Fractures of the Lower Extremity*, in *Am. Jour. Med. Sci.*, April, 1861, N. S., Vol. XLI, p. 346, and *Treatment of Fractures of the Lower Extremity by the Use of the Anterior Suspensory Apparatus*, Baltimore, 1867. On page 11, etc., of the latter work, Professor SMITH describes the apparatus as follows: "A single splint constitutes the whole of the rigid, or supporting, part of the apparatus. It may be made of wood or wire (FIG. 210). The first employed by me was of wood. It was three inches broad half an inch thick, and long enough to extend from above the spine of the ilium to the toes. It had an angle corresponding to that of the ankle, another at the knee more obtuse, allowing the leg to be very slightly flexed, and a third corresponding to the hip, still more obtuse, slightly flexing the thigh on the pelvis. Two staples, by which to suspend it, were attached to the upper surface, one a little above the knee and the other about the middle of the leg. The splint may be sawed, in one piece, out of thick pine plank, or may be made of three pieces united at the angles by nails or screws. I now employ a splint of tinned wire. The size of the wire should be that of a No. 10 bougie. If lighter than this it is apt to spring too much. It is constructed of one piece of wire bent twice at right angles, at each extremity, in the form of a long parallelogram (FIG. 210), being, however, three inches and a half wide at its upper extremity and two and three-fourths at its lower. It must be long enough to extend from a point a little above the anterior spinous process of the ilium to an inch beyond the toes when the leg, foot, and thigh are extended. Three feet eight inches will be sufficiently long for most adults. A little excess of length, above or below, is unimportant. The side pieces are to be sustained by curved cross-pieces at distances of about five inches, firmly clinched and soldered upon them, and having loops in their centres for the attachment of the hooks. The wire frame is then to be bent by the surgeon to suit the case. The lower angle corresponds to the ankle, and is one of about 120°, to secure an easy posture of the foot. The angle at the knee is very obtuse, about 160°. The angle at the hip should be of about the same degree. The angle at the ankle should be about five inches from the extremity; that of the hip seven. The middle bend corresponds to the knee. The angles are easily made by bending the splint over the margin of a strong chair or table. It will often be necessary to vary these angles to suit particular fractures. The wire frame is now to be tightly wrapped with a muslin bandage, and it is ready for application. The suspensory apparatus

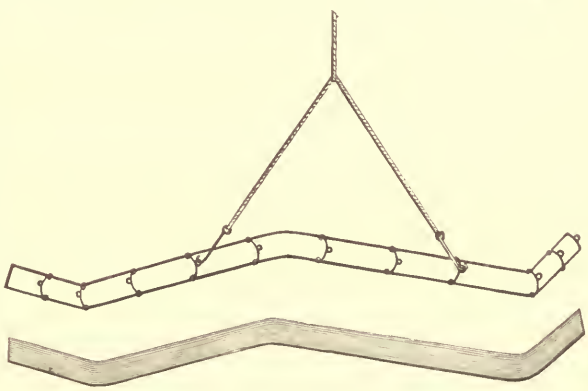

FIG. 210.—SMITH'S anterior splint.

in October, 1862, to the Surgeon General a description of a cradle splint,[1] which had been successfully employed by him in the hospital under his charge. "By this arrangement," he writes, "we have succeeded in saving thirty-seven out of fifty-three cases admitted, or

is simple and easy of application. A small iron pulley is to be screwed into the ceiling, over the bed of the patient, perpendicularly over the middle of the shin, or nearly so. A cord, about as thick as the wire of the splint, passes over the pulley, and is reeved through a small tent-block, by which, slipping it upward or downward, we elevate or depress the limb. The eccentric pressure prevents the weight of the limb from causing it to slip; if not, rub the cord with chalk. This single cord, which depends from the block, has a loop at its end, about two feet or more above the limb. Through this another cord, about five feet long, passes and hangs double from the loop, by its centre. Each end has a hook attached to it of the form represented in the cut (FIG. 211). It is made of much smaller wire. When everything is ready for suspension, these hooks are to be attached to the loops in the cross-bars. The application of the apparatus is extremely simple. The limb (we are now supposing a fracture of the thigh) is to be carefully adjusted and laid on pillows still supported by the hands of assistants. The splint is now to be laid along the upper surface of the limb, the foot portion an inch remote from the instep, the middle angle nearly corresponding to the knee. I formerly placed a long narrow compress under the splint, but it is generally superfluous. One may, however, be placed on the instep, and one under the hip extremity of the splint. I now pass a piece of wet bandage, long enough to embrace the limb and overlap, under the foot and over the splint, so as to embrace both, not tightly. I pass another, also wet, around the ankle, another beneath the knee, a fourth above the knee, and a fifth around the thigh near the hip. Button-hole slits may be made near the end of each sling, and these be buttoned on to the loops in the cross wires of the splint. The limb being still kept extended by the hands of assistants, the hooks are now to be applied. It is very important to select properly their points of attachment so as to adjust well the centre of gravity of the limb. In fractures of the middle of the thigh, I attach the upper hook nearly over the seat of the fracture; the other a little above the middle of the leg. By pulling upon the tent-block the limb is now gently raised from the pillows and hangs suspended in the slings. Observe now whether the upper portion of the splint presses down too much upon the thigh, or springs up too much from it. If the former occurs, then attach the upper hook higher; if the latter, attach the lower one lower. But this may be corrected, if slight, by slipping the cord, with the hooks attached, through the loop of the single cord so as to correct the bearings, and securing it with a piece of twine just below the loop to keep it thus. The limb being now raised, so that one may pass his hand under every part of it, the application of the roller is made. The surgeon commences with the foot, the splint being held steady. Three or four turns are to be made loosely around the foot, care being taken not to press it upward against the splint, which it must never touch. Then figure-of-8 turns are made around the ankle and foot, and the roller is carried upward along the leg and thigh, reversing, where necessary to make perfect adaptation, and great care being taken not to crowd the limb too firmly against the splint. On reaching the hip with the roller, a few spica turns are to be made obliquely through the groin and around the pelvis, concluding with two direct turns around the pelvis (FIG. 212). I often besmear the whole under surface of the bandage thus applied with starch. This prevents the slipping of the bandage, and preserves a uniform and accurately adapted surface of support." Fleet Surgeon JAMES C. PALMER, U. S. N., applied, in a case of fracture of both thighs (HERBERT SMITH, Assistant Surgeon, U. S. N., *Case of Fracture of Both Thighs*, in *Am. Jour. Med. Sci.*, 1865, Vol. L, p. 58), a modification of SMITH'S anterior splint. It consisted of two continuous parallel rods of No. 9 iron wire, passing over the anterior surfaces of both limbs, from the toes upward, arching over the pubes clear of the anterior spinous processes, and bent at the groins at an angle of about 30 degrees. The abdominal arch was well padded. Roller bandages were employed as usual, and the limbs, slung separately, were suspended by a single cord passing over a pulley at the ceiling, and making extension at an angle of about 30 degrees.

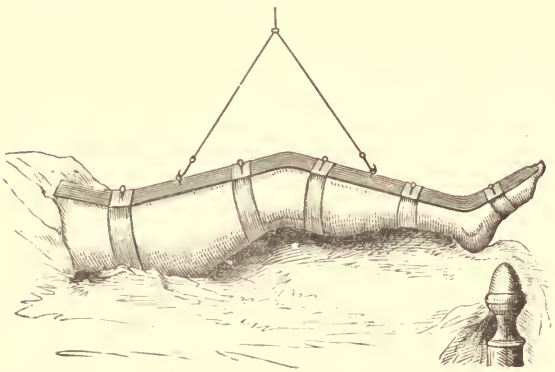

FIG. 211.—Shows suspension apparatus and the member attached to the splint by the slings at four points, preparatory to the application of the bandage. [After SMITH.]

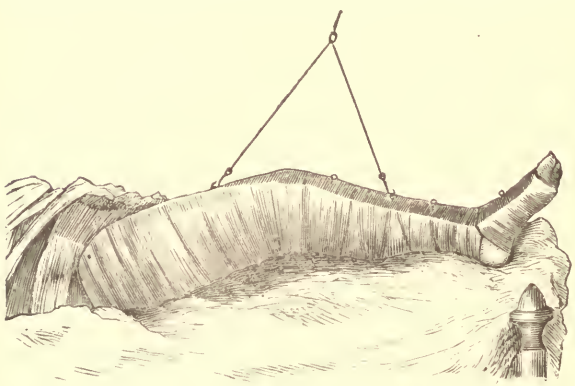

FIG. 212.—Represents the member as completely dressed and suspended. [After SMITH.]

[1] Dr. HODGEN published a description of the cradle splint in the *American Medical Times*, New York, January to July, 1863, Vol. VI, p. 245: "Having experienced great difficulty in dressing compound fractures of the femur when the wound was on the posterior part of the limb, I at length devised the apparatus to meet this difficulty. The wood-cut (FIG. 213) shows the construction of the cradle, so that I need only give the measurements and mode of application. The foot-board is four inches and a half wide, one inch thick, and fourteen inches high (or long), supported on a base fifteen inches long and one inch square. The centre support is seven inches high, eight inches on the base, and one inch thick. The uprights of this portion are one inch wide at the top and one inch and a half wide at the base; this piece is placed twenty-one inches from the foot-board. The longitudinal strips are forty-two inches long, one inch and a quarter wide, and half an inch thick; one end of each of the four is fastened by screws to the foot-piece, two at the base, the remaining two above them, leaving spaces of four and a half inches between the lower and upper pieces. The lower strips are fastened to the outside of the centre support at its base, the upper at the inner side of the upright portion, thus forming the frame represented in the cut (FIG. 213). This may be adapted to either limb by binding the ends of the pieces designed for the perinæum and pubes, the lower one from above and the upper from below, and shortening them so that the foot will come near the foot-board—the upper strip passing in front of the pubes and the lower a short distance from the perinæum. Strips of cotton or linen cloth, two and a half inches wide, are now placed on the upper longitudinal bars, and pinned, so that they form a double-inclined plane on which the limb may rest. These suspension strips are placed in contact with each other, and, being distinct, any one may be removed and replaced to insure cleanliness, when necessary, without disturbing the limb. The limb is then prepared by placing broad strips of adhesive plaster on either side of the leg and securing them in the usual manner by a roller. It is then placed on the suspension

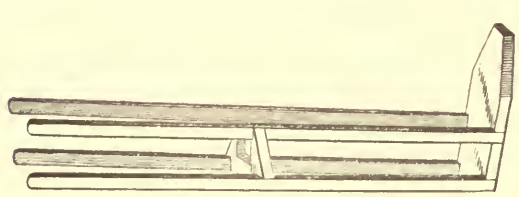

FIG. 213.—HODGEN'S cradle splint for fractures of the femur.

of 66 per cent." Surgeon J. H. Brinton,[1] U. S. V., to whom Dr. Hodgen's paper was referred by the Surgeon General for examination and report, recommended that a "certain number of these cradles be issued to the surgeons in charge of the Washington hospitals, in order that this mode of treatment be fairly tested. I do not anticipate for it a failure." In the campaign before Richmond, in 1862, Acting Assistant Surgeon J. Swinburne[2] proposed a plan for counter-extension available on the field, whereby the stretcher becomes the splint, and the system of extension can be carried into effect immediately after the receipt of the injury. In 1863, Dr. Hodgen[3] proposed a second apparatus, "a combination of the

strips, and the free ends of the adhesive plasters placed around the foot-board and secured to it. A strong cord is fastened to the middle of the foot-board at a proper height, and passed over a pulley which is to be screwed into the foot-board of the bedstead. A bag containing from five to twenty pounds of sand is attached to the cord, and this weight serves as an extending force. Two or more bricks are placed under each of the legs of the bedstead at the foot, thus elevating it four or six inches and allowing the weight of the body to serve as the counter-extending force. Thus the limb is suspended so that the air circulates freely under and about it."

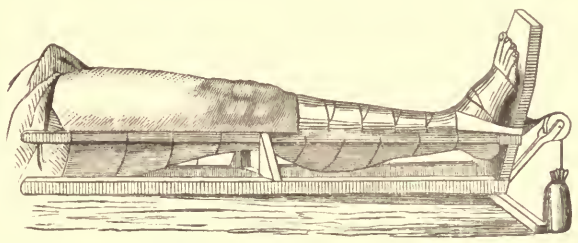

FIG. 214. - HODGEN'S splint applied.

[1] Surgeon J. H. BRINTON, U. S. V., to whom the paper of Dr. HODGEN was referred by the Surgeon General for examination, reports: "The essential portions of this treatment seems to be that the fractured limb is suspended in a cradle formed by strips of bandages attached laterally to a framework. These strips are so arranged as to form a double-inclined plane. Extension is obtained by the attachment to the foot of a sand bag of from five to twenty pounds weight. By raising the foot of the bed from six to eight inches, the weight of the body is made the counter-extending force. Surgeon HODGEN also suggests that the same result may be obtained by the use of SMITH'S anterior splint, widened at its upper end, with an oblique suspension for procuring counter-extension. In other words, this latter modification is almost identical with this apparatus as it is applied in our eastern hospitals in the treatment of compound fractures. The only difference in the application, according to the views of Dr. HODGEN, is the absence of redundant bandages. The advantages which Surgeon HODGEN claims for his cradle splint is the increased ventilation, the cleanliness, and the ease with which portions of the dressings may be changed; all of these ends are, however, attained by the use of SMITH'S anterior splint, judiciously applied, and suited to the exigencies of each individual case. From a careful study of very many cases of gunshot fractures of the thigh, both in our western and eastern hospitals, I have come to the conclusion that the treatment by suspension, in some form or other, is preferable to the use of the DESAULT or other immobile apparatus. I believe that the methods of Surgeon HODGEN and Dr. SMITH will alike be productive of good results, when properly applied and carefully attended to. The success which has been obtained by Dr. HODGEN I do not attribute so much to the new form of dressing employed as to the care, time, and attention which he personally bestows upon the cases under his charge. . . I would state, that when it is decided to try and save the limb, I should be inclined to regard the treatment suggested by Dr. HODGEN as a valuable one. It possesses, I think, all the advantages of the anterior splint, and, in the hands of a young and inexperienced surgeon, is, perhaps, more manageable. The extension can be more readily graduated, and the limb of the patient is equally open to the inspection of the surgeon. The chief objection to its employment is the mobility of the counter-extending point. This fact, which would lessen its value in the treatment of a simple fracture of the thigh, is of little moment in the class of cases resulting from gunshot injuries. In the latter, the life of the patient and the consolidation of the fracture are the chief points at stake; shortening or deformity matter but little. I would, therefore, respectfully suggest that a certain number of these cradles be issued to the surgeons in charge of the Washington hospitals, in order that this mode of treatment may be fairly tested. I do not anticipate for it a failure."

[2] The plan was explained in a paper read before the New York State Medical Society, in February, 1864 (*Transactions of the Medical Society of the State of New York*, 1864, p. 159), and a MS. copy thereof was sent to the Surgeon General U. S. A., by Dr. J. V. P. QUACKENBUSH, Surgeon General of the State of New York, on April 11, 1864: "As soon after the injury as practicable, to place the patient on a bed or stretcher, extend the limb as near as possible to its normal length, without giving too great pain, retain it in that position by fastening the patient's foot to the foot of the bed or stretcher by means of adhesive plaster, as I am in the habit of doing in ordinary fractures of the thigh (FIG. 215). Of course there should be no bandaging of the leg or thigh. Make the counter-extension by the use of a large perineal belt fastened to the head of the bed or stretcher. In order more fully to make the *stretcher a splint*, I propose to place two sliding iron rods, 4, 4, the length of which should be from 8 to 12 inches, and placed upon the handles of the stretcher, which are to be provided with thumb screws, 3, 3, to keep them in any desirable position, and allow of their being depressed, elevated or extended, as the case may require. The foot-strap or cord can be fastened to the sliding iron rod, 4, 4, at the foot of the stretcher, while the perineal belt, 2, can be fastened to the sliding iron rod or arm, 4, 4, at the opposite end. Thus making an apparatus for the treatment of this fracture as complete and perfect as can possibly be produced in private practice; and since the majority of these fractured bones suffer no loss of substance, why should we not then succeed in effecting as good results by this method in army practice as in private practice?"

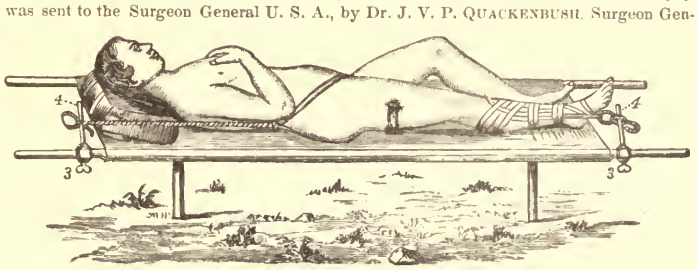

FIG. 215.—SWINBURNE'S plan of applying early extension. [After SWINBURNE.]

[3] HODGEN (J. T.) (*On the Treatment of Gunshot Fractures of the Femur and Tibia*, in *American Medical Times*, 1863, Vol. VII, p. 169, and in *The St. Louis Medical and Surgical Journal*, January and February, 1864, Vol. I, p. 20): "The body of the splint is made of No. 2 iron wire, which is sufficient to support the limb, all of one piece, bent as seen in the cut (FIG. 216). The dimensions are as follows: Four inches across the bottom of the foot; twenty-two inches from the foot to the bend at the knee; twenty inches from the bend of the knee to the upper ends of the wire (corresponding to the pubes and hip when applied). These upper ends are eight or nine inches apart, being separated by a bow of thick wire; another similar bow is placed at the knee, having a span of six inches. These two bows are made so as that they can be put on or taken off without disturbing the dressings, and are put in position after all else is arranged—the one at the hip having a loop at each end to receive the upper end of the splint wires, the other simply hooks, to be looped on at the knee. A roller bandage may be placed around the hips and upper end of the external limb, the splint to keep the latter in place, if required. How applied: A bandage is applied to the foot; an adhesive strap, three inches wide, is applied to each side of the leg, extending four or five inches below the foot, and up to the knee in case of fracture of the femur; or to the fracture, in case the tibia is the injured part. The roller is then extended smoothly over the adhesive plasters. That limb of the splint designed to pass next the pubes is bent upward, at a point

principles of Smith's anterior splint, Swinburne's extension, and the strip bandage supports used in the cradle splints," which he had found in some respects more desirable than the cradle splint. Dr. Gurdon Buck's apparatus,[1] a modification of Physick's Desault, in which the long splint was dispensed with, and constant and uninterrupted extension was kept up

from the bend of the knee in the splint, corresponding to the distance from the bend of the knee to the pubes on the sound side of the body. Strips of bandages three inches wide are now looped over one limb of the splint, continuously from the upper to the lower end, and allowed to belly downward a distance equal to two-thirds of the diameter of that part of the extremity designed to rest upon each one; the other ends of these strips are pinned over the other limb of the splint, thus forming a double-inclined trough in which the extremity is now to be placed on these strips of muslin. The free ends of the adhesive strips are next fastened to the cross-piece at the foot, three inches apart, and the whole suspended from a pulley fixed to the ceiling or a frame; the pulley should be almost over the foot if the ceiling be eight or ten feet high, giving the suspending cords an oblique direction, that in this way we may have sufficient extension. If the patient is disposed to slide toward the foot of the bed, this must be elevated on two bricks under each of the legs at the foot of the bedstead."

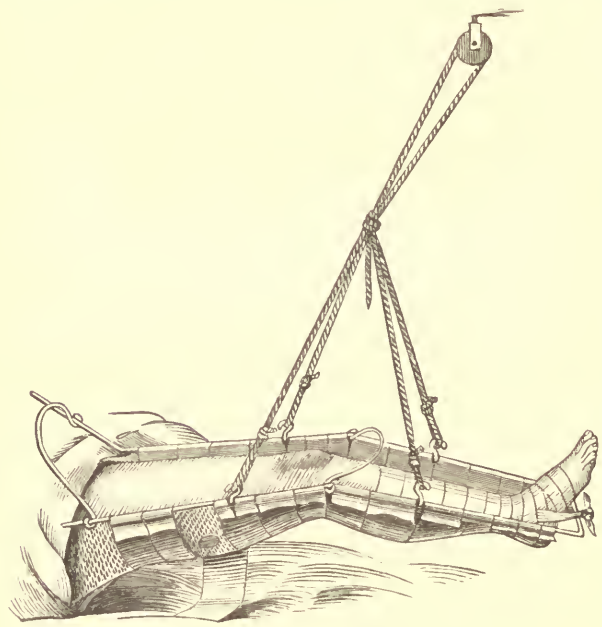

FIG. 216.—J. T. HODGEN'S suspension apparatus.

[1] The apparatus used in the New York hospitals since 1859 (G. F. SCHRADY, *Report of the Proceedings of the Medical Society*, in *New York Journal of Medicine*, 1859, Vol. VI, 3d series, p. 239) is explained in the *Am. Med. Times*, 1861, Vol. II, p. 214. The following description is taken from BUCK (GURDON), (*Description of an Improved Extension apparatus for the Treatment of Fractures of the Thigh*, in *The Medical Record*, 1867–68, Vol. II, p. 49): "Articles composing the apparatus: Two bands of adhesive plaster spread on Canton flannel or thick twilled cotton; each band being two inches and a half wide and two feet long. At the end of one of the bands a piece of elastic rubber webbing, two inches wide and ten long, is attached. At one end of the other band a buckle of corresponding width is fastened. A thin block of wood three inches and a half wide transversely and three inches vertically. The perineal portion consists of rubber tubing of one inch calibre, having inside of it a tube of muslin stuffed with bran and left an inch longer than the rubber tube at both ends. At each end of the muslin tube a metallic ring is first fastened, and then shoved within the rubber tube, to the end of which it is also fastened. This arrangement prevents the rubber tube from being over-stretched. Two straps fastened to the rings at the ends of the perineal portion serve to lengthen it and allow it to be made fast to the head of the bedstead. A belt that passes around the opposite side of the body, and maintains the bearing of the perineal band in a line with the axis of the body and limb. The perineal portion should be wound with a narrow strip of Canton flannel or other soft material, and this should be changed as often as soiled. Four guttered coaptation splints, covered with flannel, are intended to surround the fracture and be secured in place by three elastic bands, each having a buckle at one end. An upright supporting a pulley wheel, to be fastened to the floor by three screws, opposite the foot of the bed. Mode of application: The bands of adhesive plaster are first to be applied, one on either side of the limb from a point above the ankle upwards as high as the seat of fracture. The limb is then to be bandaged in the usual manner, beginning at the toes and covering the plasters, but leaving their lower ends free. The band of elastic webbing is next passed around the sole of the foot and fastened to the buckle on the other side of the foot. The block of wood should then be interposed between the loop of webbing and the foot. A cord fastened to the block thus adjusted is passed over the pulley, and has a weight suspended from it. This arrangement combines elasticity with the extending force, keeps the bands stretched out smooth, and prevents pressure upon the ankles. The amount of weight required must be proportioned to the resistance to be overcome and the toleration of the patient. Sometimes five or six pounds only can be borne at the outset, and an increased weight subsequently. After a fracture has taken place the sooner the limb is put up and subjected to treatment the better. Spasmodic twitchings of the muscles are controlled, and the patient made comfortable from the outset. To permit the application of lotions to the seat of injury during the first few days, the bandage should not be carried above the knee, and the ends of the plaster should be rolled up and kept in reserve. At the end of six or eight days the plasters may be extended up on the thigh and the bandage continued over them. The coaptation splints are now to be applied around the thigh and secured by the three elastic bands. To complete the apparatus the perineal band should be adjusted and its ends fastened to the head of the bedstead so as to be in a line with the axis of the body and limb. The limb should be raised on a hair cushion sufficiently to keep the heel from pressure. In the employment of this method of treatment, experience has shown that in a large majority of cases the use of the perineal band may be dispensed with, the weight of the body being sufficient to resist the extending force. This resistance may be further increased by raising the foot of the bedstead five or six inches above the floor. The advantages claimed for this method over others heretofore in use are its great simplicity of arrangement, facility of management, and especially the comfort it affords the patient during a long confinement in bed. The efficiency with which uninterrupted extension of the limb can safely be kept up secures, it is believed, better results than have been obtained

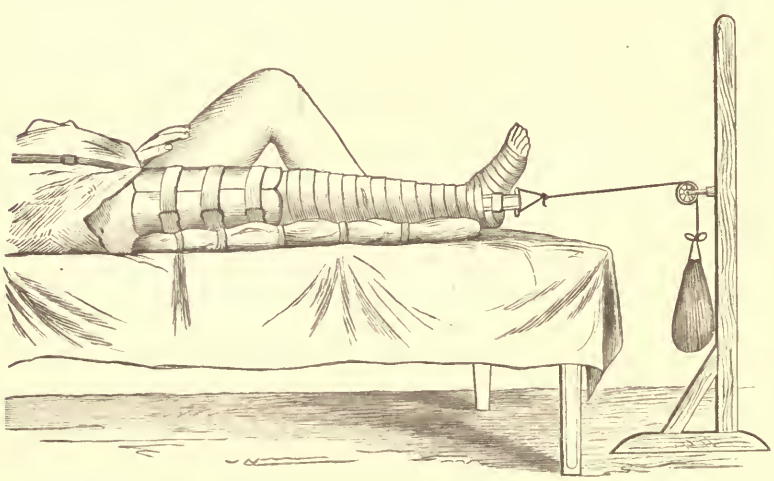

FIG. 217.—GURDON BUCK'S apparatus.

by means of a weight and pulley, was frequently employed during the war.[1] Dr. Vedder,[2] in 1862, recommended a long straight splint, which by a mechanical arrangement may be folded in the middle when not in use, and securely straightened when desired. Extension is made by a rachet pulley, a drawing of which has already been given in FIGURE 570, on page 812 of the *Second Surgical Volume*. During the last year of the war a combined splint and fracture bed, constructed by Dr. I. Langer,[3] was used with favorable results by

by any other method. The sitting posture may be allowed without disturbing the action of the apparatus; an indulgence for which patients are always very grateful, and one which greatly alleviates the irksomeness of their condition. The materials required for employing this treatment are obtainable under almost any circumstances, the only indispensable article being adhesive plaster. If this is of the ordinary description it is better to use it of double thickness. All the other articles requisite may be improvised. The elastic band may be dispensed with, and a round stick properly placed across the foot of the bedstead may serve instead of a pulley."

[1] In a report to the Surgeon General, in February, 1863, Surgeon H. J. CHURCHMAN, U. S. V., speaks favorably of BUCK'S pulley: "In regard to mechanical appliances I much prefer BUCK'S pulley with side splints rolled in muslin, which may be so tacked to splints as to permit their being easily thrown down for dressing or inspection. Of course when there is a discharging wound the splint must be so shaped as to leave wound readily accessible. In lieu of the usual counter-extending adhesive strips or the galling perineal band, I propose to substitute, when attainable, the old-fashioned ribbed corset, lacing up in front with side buckles, by which, with strong tapes, the body may be secured to the bunk or bedstead. The tape might be tightened or loosened as deemed necessary. This apparatus would relieve materially the vexation of spirit to both surgeon and patient necessarily incident to the old plan. I propose this in connection with BUCK'S pulley, while the side splints, arranged as I have stated, give uniform support to the limb in its whole extent and keep it in proper line. In the absence of the corset, I have heretofore advantageously employed in several instances BUCK'S pulley, with side splints as described, and elevation of foot of bed, as described in case 5. The corset will relieve a position found more or less uncomfortable to patient. The only objection in theory is the difficulty of defecation when bound down by the side straps. In practice there is no serious difficulty when using the bed-pan. If deemed necessary, however, the men can readily unbuckle the straps for the time."

[2] VEDDER (JOSEPH H.), *New Apparatus for the Treatment of Fractures of the Long Bones*, in *American Medical Times*, 1862, Vol. IV, p. 254.

[3] Under the direction of the Medical Director of the Army of the Potomac, Colonel T. A. MCPARLIN, Dr. LANGER'S apparatus was tried by Surgeon W. L. FAXON, 32d Massachusetts, who reports, on March 28, 1865: "I have the honor to report that on the 7th and 8th days of March, 1865, I witnessed the application of Dr. I. LANGER'S combined splint and fracture bed, in two cases of compound fracture of the thigh, one near the trochanter major, the other at the middle third, in consequence of gunshot injuries. Each of the patients were transferred and located comfortably, in ten minutes, from the beds on which they were lying to Dr. LANGER'S beds, with the aid of two assistants. Extension and counter-extension were applied from the beginning. No anæsthetics were given, and the patients have evinced no suffering. The changing of the sheets lying under the patients and the evacuations from the bowels during their confinement were effected without the necessity of lifting the patients from the beds they were first put on. The discharge of the matter from three wounds in the first case—the bullet entering at the edge of the nates on the left side, penetrating the left thigh, and entering the right limb one inch below the tuberosity of the ischium—as well as from the two wounds in the second case, has not at any time made the patients uncomfortable, as the matter and the water used for cleansing ran off freely. The position as well as the axis of the limbs are nearly straight, and the shortening in neither case exceeds one inch. I consider Dr. LANGER'S combined splint and fracture bed as I have seen it in operation at this hospital as the best appliance I have used, or seen used in the army. The patient can always be made comfortable; he seldom requires opiates to procure sleep (in neither of the cases above quoted were any bed-sores); the patients can always be kept clean, the bed clothing is not at all soiled, one nurse can take care of as many cases as of simple wounds, and the operation of lifting and shifting the patient in dressing of the wound is entirely avoided, an object of great importance to all concerned; and I respectfully request that fifty of Dr. LANGER'S beds be furnished for use of this hospital, if possible." This report received the favorable endorsement of the Acting Chief Medical Officer of the Depot Field Hospital at City Point, Surgeon G. B. PARKER, U. S. V., and was forwarded to the Surgeon General of the Army for favorable consideration by the Medical Director, Colonel T. A. MCPARLIN. Dr. LANGER'S apparatus consists of a triple-inclined plane, on which extension and counter-extension of the fractured femur is kept up by the weight of the body and the leg: "It is constructed of iron and covered with duck-cloth; its weight is twenty-six (26) pounds, including the straps to swing the apparatus in an ambulance wagon or anywhere else. It consists of: *a*. One head piece. *b*. Two trunk bars. *c*. One cross piece. *d*. Two thigh pieces. *e*. Two leg pieces. *f*. Two bows under the knees. The thigh as well as the leg piece, for the injured limb, has pins to support the straps on which the limb rests. *a*. Head piece connected with the trunk bars, arranged to change its relative position, when vertical, to form a shelter to the head, when horizontal, to make an elongation to the trunk part for the head to rest on, or serving instead of legs, when set down, with a strip of wood at its opening to keep it spread; it is covered with double cloth, which is to be stuffed if chosen. *b*. Two trunk bars, connected with the head piece by bolts and thumb-nuts; to the necks of the bolts straps are fastened to swing the apparatus. On each of the bars is a loop for an additional strap, to support the arm, or if the wounded man is exposed to the weather, to attach there a storm hood. Between these bars cloth is stretched for the patient to rest on. A blanket and a sheet doubled up and spread over the cloth before the patient is laid on it will enhance the comfort. These trunk pieces are connected with the cross piece in a manner as to allow the change of their relative position from a level with the thigh pieces to an angle of 45°. *c*. Cross bar, with a bend nine inches, opening to receive a bed-pan with a neck on each end, to rest on a fulcrum having a head to secure against slipping. Near the angles of the bend are two holes to receive the screws of *d*. *d*. Two thigh pieces, rotating in a loop connected, movable, with a screw and thumb-nut, with the cross-piece so as to allow either of the two thigh pieces to elevate or lower nearly three-fourths of a circle; also to allow to separate one from the other; but if wanted stationary they are fastened together by a

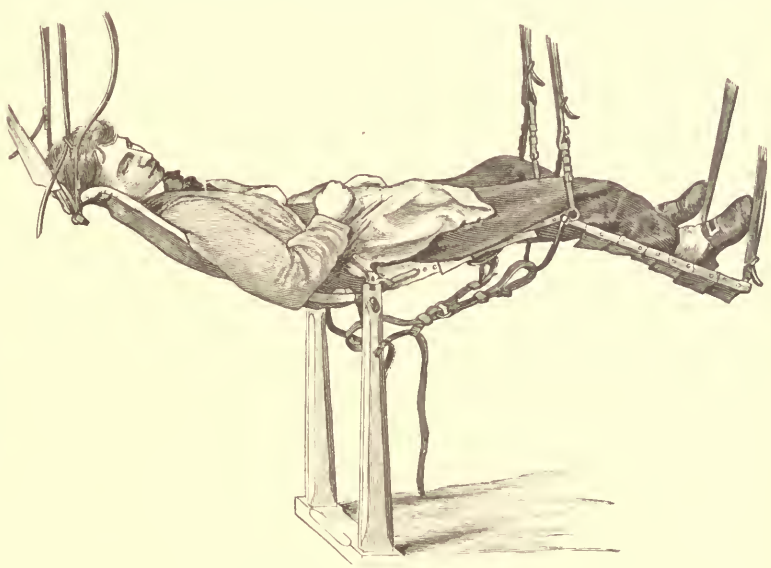

FIG. 218.—Dr. I. LANGER'S apparatus.

surgeons of the Army of the Potomac. In a few instances the single long splint of Dr. Kimball[1] was preferred. Assistant Surgeon W. Thomson, U. S. A., substituted the "bran box for Hodgen's splint, which had become uncomfortable and difficult to adjust."[2] Surgeon J. T. Woods, 99th Ohio, employed the double-inclined plane in fractures of the femur near the trochanters, and Desault's splint, or some modification thereof, in fractures of the middle third of the femur.[3] Surgeon E. McDonnell, U. S. V., advised that in fractures of the upper third of the femur all extension apparatus be dispensed with as liable to produce a hiatus between the fractured ends, leaving, on account of the absence of periosteum and nourishing vessels, no chance for repair, and that the limb be simply placed in an easy position regardless alike of deformity and shortening.[4] The danger of producing such a separation of the ends of bone as might delay if not interfere with the union of bone was pointed out by Dr. J. R. Lothrop, at the Buffalo General Hospital,[5] and other surgeons.

The method of wiring together the fractured ends of long bones proposed by Assistant Surgeon B. Howard,[6] already referred to in the *Second Surgical Volume*, at page 819, found

---

key; four holes on each end, to adjust the length and to connect with the spreading bows under the knee and the leg pieces. On each end of the thigh pieces are slats for the straps to swing the apparatus; when the two thigh pieces are connected by key there is still a place left for defecation. *e.* Two leg pieces, with four holes on each end, to be adjusted and connected outside of the end of the thigh pieces; the cross bars of each have a hole for a cord to pass through, to fasten a weight to the foot if required; to the cross bar is a strap fastened to swing the apparatus. The inner corner to be connected with a cord. One of the thigh as well as one of the leg pieces has pins to fasten the straps stretched across for receiving the injured limb to rest on. The other is covered with cloth; both of them have a well padded cushion secured at the end near the cross piece. *f.* Bows under each knee, to connect by a bolt and thumb-nut, inside of the ends of the thigh pieces, to keep the thigh and leg piece from drawing together by the weight of the limb resting on them. To these two bows a strap is attached, which fastens to the floor, preventing side motions or raising the whole apparatus."

[1] SARGENT (F. W.), *On Bandaging and other Operations of Minor Surgery*, Philadelphia, 1862, p. 182. Dr. KIMBALL'S splint extends from the axilla to below the foot, but is so contrived as to be capable of being lengthened at each extremity by sliding bars. The upper sliding bar terminates in the manner of a crutch; to the lower is secured at right angles a transverse bar, which is moved up and down by screw, thus regulating extension at will. The perineal band is used, but may be discontinued with safety by moving the upper crutch-like sliding bar into the axilla.

[2] Report of Assistant Surgeon WM. THOMSON, U. S. A., in charge of Douglas Hospital, Washington, for June, 1863 (*File A, No.* 103): "It is difficult to conceive of a more suitable apparatus for compound gunshot fractures of the thigh than the Bran Box, properly arranged. The limb is supported at every point; the skin is kept cool and dry, and the profuse discharge easily removed at each dressing. Where extension is desired, it can readily be made by fastening the adhesive strips attached to either side of the leg to the box and then adding a sufficient weight to a cord fastened to the foot-board."

[3] In his report from the hospitals at Chattanooga, Surgeon WOODS remarks: "The limbs were placed in positions most comfortable to the patient for some time, when, suppuration having at last become much reduced in quantity and the reparative callus was being thrown out, they were (usually under chloroform) placed in some form of splint with moderate extension and counter-extension. My observation led me to conclude that the double-inclined plane is inferior save where the fracture is within a short distance of the trochanter, and the tilting of the upper fragment requires the adaptation of the lower fragment to it by changing the position of the leg from the straight line, and possibly when the fracture is so low down that the condyles are drawn backward and downward. SMITH'S anterior splint failed to meet my expectations in every particular. If it be applied as Dr. SMITH directs, the parts are hidden from view, sacculation of pus occurs, drainage is imperfect, and filth accumulates in the bandage. If the leg be simply suspended in the wire frame, sufficient quietude of the parts is not maintained, and the extension is neither sufficient nor reliable, and, if the fracture be in the upper third, the motions of the body produce movement in the fractured extremities—just what a splint is designed to prevent. The splint of DESAULT, modified in various ways to suit particular cases, can be so applied as to secure the desired immobility, extension, drainage, exposure, and cleanliness. My impression from observing these cases leads me to conclusions briefly summed up thus. . . The proper dressing of a limb is really of great importance and very much underrated. That 'supporting' diet in the early stages of these injuries is over-estimated. That an object of the first importance is to secure an abundance of fresh air, cleanliness, and perfect drainage. A very great error consists in excessive bandaging—a limb is better off without bandaging or splints until reparation has commenced. The covering of gunshot wounds with lint, either picked or patent, is objectionable; the pus drying at the edges glues it fast and is not permitted to drain away. The best splint for fracture at the trochanter major or immediately above the condyles is some form of the double-inclined plane, and, for fractures in the middle of the femur, some modification of the DESAULT splint."

[4] Surgeon E. MCDONNELL, U. S. V., who had charge of a field hospital after the battle of Antietam, remarks, in a special report, transmitted in February, 1863, of a fatal case of fracture of the upper third of the femur treated by BUCK'S apparatus: "It appears to me the lessons most practically deducible from the foregoing case are two, viz: 1st, that there was such a destruction of bone that when the limb was extended by BUCK'S plan a hiatus was produced between the fractured ends, as left by the absence of periosteum and any nutrient vessels no chance for repair—hence I think this or any apparatus separating the fractured bones destructive of our hopes of a good result. This case, with many others in the hospitals of Sharpsburg, gave ample scope for contemplation on the different methods devised by distinguished members of our profession to advance conservative surgery. The result of my observation is that, should I ever have charge of as many wounded men as those in the Sharpsburg hospitals, over which I had control, I should in all cases of badly compound comminuted fractures of the femur in the upper third dispense with *all* extension apparatus, and simply place the limb in an easy position regardless alike of deformity and shortening (amputation being out of the question). This I am persuaded is the treatment to save most lives."

[5] LOTHROP (J. R.), *A Case of Gunshot Wound of the Femur*, in *Buffalo Med. and Surg. Jour.*, 1860, Vol. V, p. 470.

[6] In his article (*The Application of Sutures to Bone in Recent Gunshot Fractures*, in the *Medico-Chirurgical Transactions*, London, 1865, Vol. XLVIII, p. 252) Dr. HOWARD defends this expedient: "The shock of the operation involved in this plan of treatment, superadded to that of the original wound, immediately suggests itself, of course, as an objection to its adoption. Over against this, however, we must weigh the immediate dangers previously enumerated from the pressure and constriction of tight dressings attending the use of simple splints. Those from the enclosed fragments and spiculæ during transportation being in continual motion, and afterwards awaiting tedious extrusion by the slow processes of nature, keeping the patient in a condition which renders him continually susceptible to various intercurrent diseases, and, should union be ultimately effected, the degree of effort called forth for its accomplishment has left behind such a surplus of provisional callus, and other pathological changes in the parts adjacent, as seriously to diminish the usefulness of the limb for a long period, with a still further danger that after apparent recovery tertiary sequestræ, as mentioned by DUPUYTREN, may continue to be extruded for ten, fifteen, or even twenty years thereafter. In the operation described the chief causes of the evils above enumerated are removed. Its advantages consists mainly in this: 1st. Negatively: In the absence of everything which may act as a foreign body and dangerous

even less favor in shot fractures of the femur than in those of the humerus, and it seems that in one instance only this plan was attempted:

CASE 497.—Private H. Ingalls, Co. B, 6th Ohio Cavalry, was wounded during the engagement near the Pamunkey River, May 28, 1864. He was admitted to the field hospital of the 3d division, Fifth Corps, whence Surgeon L. W. Reed, U. S. V., reported the injury as a "severe shell wound of the left thigh." From the field hospital the patient was moved to White House Landing, where he died from the effects of his injury on June 2, 1864. This case has been identified as one published by Dr. Benjamin Howard, late Assistant Surgeon, U. S. A. (*Medico-Chirurgical Transactions*, London, 1865, Vol. XLVIII, p. 251), as follows: "On May 29, 1864, I was called in consultation on the field to see the patient, who was sixty years of age and of broken down constitution; he had received a severe fracture of the femur from a large fragment of shell, which I found firmly wedged into the bone about three inches above the knee. From this point there proceeded a long oblique fracture, running upwards and outwards, with some comminution of the inner aspect of the bone in the vicinity of the piece of shell. The sharp pointed lower fragment was overriding the upper, causing a shortening of about three inches, reduction of which, with such a wound, could not possibly be maintained with splints alone during transportation. Having made the requisite incision and extracted the impacted piece of shell, I proceeded to remove the looser fragments; then causing steady extension to be kept up while I kept my finger and thumb in the wound, I guided the fractured ends so that the corresponding serrations were accurately refitted to their original position for about two thirds of the circumference of the bone. Having somewhat enlarged the incision, I directed the limb to be so bent upon itself as to slightly reopen the fracture, while I drilled the requisite holes and passed a suture, which firmly secured the interlocked fragments, rendering shortening or shifting impossible. A straight splint was then applied, the wound being left exposed for the repetition of cold-water dressings. After the operation the patient ceased to complain of pain and seemed very comfortable. The next morning he was hurried away in an ambulance train, and I saw no more of the case. In consideration of his age, the nature of the wound, and his broken-down constitution, I was not surprised when subsequently I incidentally heard that he died on the road three days afterwards."

The amount of shortening[1] of the injured limb was indicated in seven hundred and thirty-two[2] of the sixteen hundred and eighty-nine cases of recovery after shot fractures of the femur treated by conservation, varying from one-quarter of an inch to eight inches, and averaging 2.31 inches.[3] In fifty-two cases the reports indicated shortening, but the precise amounts were not stated. In twelve instances it was recorded that there was no shortening whatever, and in eight hundred and ninety-two this point was not noted. One instance is reported in which the limb was found lengthened:[4]

---

source of irritation. 2d. Positively: In securing complete coaptation and perfect rest. This plan of treatment is new only in its application. Substantially the same operation, including the use of the wire suture, has for a long time been practised, and still meets with general approval, as a *secondary* operation for ununited fracture. Other things being equal, why should it be less advisable as a *primary* one, where, in the absence of all pathological changes, we have a healthy condition of all the parts, with sound bone in apposition and at rest. These considerations led me to hope for a healthy process of uninterrupted repair, with speedy use of the limb after union. The selection of the cases (which at most must be quite limited in number, either on the field or in civil practice), the amount of bone which may be with propriety removed, etc., must, of course, be a matter of careful judgment."

[1] The exact amounts of shortening in the 732 cases in which this point was ascertained are: ¼ of an inch in 1 instance; ½ in 1; ⅝ in 20; ¾ in 17; 1 in 77; 1¼ in 19; 1½ in 1; 1⅝ in 80; 1¾ in 13; 2 inches in 179; 2⅛ in 2; 2¼ in 5; 2⅜ in 82; 2½ in 14; 2⅞ in 1; 3 in 111; 3¼ in 5; 3½ in 23; 3¾ in 3; 4 in 42; 4½ in 6; 4¾ in 1; 5 in 16; 5½ in 3; 6 in 5; 6½ in 1; 7 in 2; 7½ in 1; 8 in 1.

[2] Assistant Surgeon DEWITT C. PETERS, U. S. A., in a letter to Medical Inspector JOHN M. CUYLER, U. S. A., dated Jarvis U. S. A. General Hospital, Baltimore, January 11, 1864, remarks: "Recently I had the opportunity of hurriedly examining twenty-five rebel prisoners who were wounded at Gettysburg, and had, up to a late period, been treated in hospitals near the field. They were lying side by side and had compound gunshot fractures of the femur. My time was limited, as they were under orders to embark for exchange; but I measured their injured limbs and found the greatest amount of shortening to be four inches, and the least about one inch. Average near two and a quarter inches. I believe you were instrumental in having these bad cases retained near the battle field, also many others, and the happy results prove your wise forethought. I have long argued that many of these cases were killed by transportation employed too early. The cases I saw fully show how much nature can do; but I cannot say so much about the treatment, for some of them were strangely crooked, bowing every way. I think with proper extension and counter-extension they might have been greatly improved. I thought the mention of them might be interesting, as they were prisoners and depressed in spirits; it further adds to our knowledge of nature's reparative powers when aided."

[3] The instances in which the shortening of the limb after recoveries from shot fractures of the femur has been recorded in military surgery are few: STROMEYER (L.) (*Maximen der Kriegsheilkunst*, Hannover, 1855, p. 724) remarks that he has notes regarding the length of the limb in 12 of the 15 cases of shot fractures of the femur that he observed. In one of these the shortening was 5 inches; in 1, 4 inches; in 4, 3 inches; in 5, 2 inches; and in 1, 1 inch, averaging 2¾ inches. CHENU (J. C.) (*Rapport, etc., pendant la Campagne d'Orient en* 1854–55–56, Paris, 1865, p. 375 *et seq.*) cites 126 cases of recovery after shot fractures of the femur. The amount of shortening is ascertained in 32 cases, varying from 3 to 11 centimetres, and averaging 5.7 centimetres, or about 2¼ inches. WILLIAMSON (GEORGE) (*Military Surgery*, London, 1863, p. 138) reports, from the mutiny in India, in 1857–58, 13 cases, viz: "Limb 3 inches shorter in 3; 2½ inches shorter in 1; 1½ inch shorter in 4; and 1 inch shorter in 5 instances;" an average of 1.7 inch. CHENU (J. C.) (*Stat. Méd. Chir. de da Camp. d'Italie en* 1859 *et* 1860, Paris, 1869, p. 715 *et seq.*) reports, among 118 cases of recovery, 25 cases with shortening varying from 2 to 15 centimetres, the average being 7 centimetres, or 2¾ inches. BECK (B.) (*Chirurgie der Schussverletzungen*, Freiburg, i. B., 1872, p. 694 *et seq.*) ascertained the shortening in 23 instances varying from 1 to 4½ inches, averaging 2.25 inches. CHENU (J. C.) (*Aperçu Hist. Stat. et. Clin.*, Paris, 1874, p. 453 *et seq.*) records 705 invalids after shot fractures of the femur treated by conservation. Shortening is stated to have existed in 426 instances; in 201 cases the amount of shortening is definitely stated, and varies from 3 to 23 centimetres, averaging 7.4 centimetres, or very nearly 3 inches. According to these limited statistics the average shortening in shot fractures of the femur is 2.7 inches.

[4] Professor F. H. HAMILTON (*A Practical Treatise on Fractures and Dislocations*, Philadelphia, 1875, p. 516) relates the following case as an example of lengthening of the limb after shot fracture of the femur: "Melchior Briétel, Private, 12th N. Y. V., was wounded in June, 1862, at the battle of White Oak Swamp, Virginia, by the fragment of a shell, which struck the left leg three inches above the condyles. He was taken to Richmond as a prisoner, and about a month later he was exchanged and sent within our lines. January 1, 1864, I found him in the United States General Hospital, at Newark, under the charge of Surgeon Taylor. The wound was still discharging matter occasionally, and several fragments of bone had been removed. Splints were not applied until after his exchange. No extension was ever employed. At the end of four months he began to walk about with crutches.

CASE 498.—Lieutenant J. Davis, Co. G, 73d Ohio, aged 35 years, was wounded at New Hope Church, May 25, 1864, and admitted to the field hospital of the 2d division, Twentieth Corps. One week after receiving the injury the patient was moved to Chattanooga, where the wound is described as an "injury to the trochanter major." He was subsequently sent to the Officers' Hospital at Nashville, whence he proceeded to his home on leave of absence, August 10th. He was mustered out of service May 5, 1865, and pensioned. Examiner O. J. Phelps, of Piketon, Ohio, certified, July 25, 1865: "The ball entered at the groin, passed through, shattering the trochanter major, and as yet rendering the limb entirely useless. It is still unhealed." Examiner J. Arnold, of Waverly, December 12, 1871, stated: "The hip joint is rendered entirely useless. There are two ulcerating sores that discharge very much all the time, and small pieces of bone are taken out. Has to use crutches to get about." Examiner W. Scarlock found no improvement in the pensioner's condition in September, 1873, and reported, two years later: "One running sore still exists on the outer side, over the great trochanter. There are four tender cicatrices that have recently healed, two on the inner and two on the posterior side, ranging from four to six inches below the original wound. The limb is lengthened some three inches, and its movements are painful and limited. The wound still requires dressing once or twice a day." At a subsequent examination, in 1877, the limb was still found to be in the same condition, lengthened, etc., and the pensioner was reported as wholly unfit for any occupation requiring manual labor. The pensioner was paid Sept. 4, 1879.

The side of the injury was recorded in three thousand and thirty-six instances; fourteen hundred and thirty-one were on the right, and sixteen hundred and five on the left side. Of the former, six hundred and sixty-one, or 46.1 per cent., and of the latter seven hundred and forty-three, or 46.2 per cent., were fatal. Here, as well as in the cases of shot injuries of the shoulder joint and arm (*Second Surgical Volume*, pp. 610, 806), the left extremity seemed to have been most frequently interested; but here, also, the number of cases in which this point could not be ascertained (four hundred and thirty-one) prohibited definite conclusions on this subject. In two hundred and eighty-four cases the fractures of the femur were accompanied by lesions of other portions of the body: fractures of the bones of the head in nine instances, penetrating wounds of the chest in five, penetrating wounds of the abdomen in three, fractures of the pelvic bones in thirteen, fractures of the upper extremities in thirty-three, fractures of the opposite lower extremity in twenty-five, and in one hundred and ninety-six instances the fractures of the femur were accompanied by shot flesh wounds of the upper or lower extremities. Pyæmia was noted in one hundred and fifty-one instances with one hundred and forty-seven deaths; tetanus in eighteen with seventeen deaths; gangrene in fifty-three with thirty-two deaths; erysipelas in forty-six with twenty-six deaths; and hæmorrhage in one hundred and thirty-three with one hundred and eighteen deaths. The external iliac artery was unsuccessfully ligated in one instance:

CASE 499.—Private M. Teel, Co. C, 73d Indiana, was wounded through the upper third of the right thigh, at Stone River, December 31, 1862. Assistant Surgeon F. L. Town, U. S. A., reported that the wounded man was admitted into hospital No. 4, Nashville, six days after receiving the injury, where, by reason of secondary hæmorrhage, the external iliac had to be ligated, resulting fatally on January 19, 1863; also that the severity of the original injury was sufficient to produce death.

The femoral artery was ligated in twenty-one instances, of which two proved successful. Socin[1] has remarked that in a shot fracture of the femur "accompanied by an injury of the artery alone, conservation might yet be attempted after an utmost early ligation;" but a most careful examination of all the cases of shot fractures of the femur treated by conservation during the American civil war has failed to disclose a single instance of recovery after fracture of the femur accompanied by an unquestionable primary lesion of the femoral artery. In the following instance the femur had been fractured and the femoral artery severed by a minié ball; the artery was promptly ligated. The patient survived nine months and eleven days, but finally perished from the effects of the injury:

On measuring I found this limb lengthened half an inch, and this measurement was confirmed by Surgeon TAYLOR and others. There was no anchylosis at the knee joint." Professor HAMILTON must have been mistaken as to the name of the patient. The name of Melchior Brictel is not borne on the rolls of the 12th New York Volunteers. A private, Melchior Breitel, I, 12th New Jersey Volunteers, wounded at Chancellorsville, Virginia, May 3, 1863, was admitted to the Newark U. S. A. General Hospital with a gunshot wound of the thorax and the left arm, September 9, 1863. He was discharged March 28, 1864, and has been a pensioner since. The records of the Newark hospital, as well as the soldier's certificate of disability, and the certificates of two pension examining surgeons, agree in the diagnosis: "Gunshot wound of chest and left arm," but no mention is made of a shot fracture of the femur or its treatment, and Professor HAMILTON himself, in his *Lectures on Gunshot Injuries of the Chest*, in *American Medical Times*, 1864, Vol. VIII, p. 182, cites the case as an example of perforating wound of the lung followed by empyema, without mentioning an injury of the femur.

[1] SOCIN (A.), *Kriegschirurgische Erfahrungen*, Leipzig, 1872, p. 128.

CASE 500.—Private *B. M. Dunn*, Co. D, 1st Louisiana, was wounded in the right thigh, at Gettysburg, July 2, 1863, and admitted into Camp Letterman four weeks after the injury. Assistant Surgeon W. F. Richardson, C. S. A., reported: "He was wounded by a minié ball, which entered at the inner anterior portion of the thigh about the middle third, and made its exit at the posterior and outer portion, severing the femoral artery and fracturing the femur in its course. The femoral artery was ligated in Scarpa's space on the day of the injury. When admitted in my ward the patient was suffering intolerable pain, occasioned by moving him four miles in an ambulance over a rough road, without splints, sand-bags, bandages, or any other appliance to the limb, and with the ends of the bones overlapping each other. I administered chloroform and placed the bones in apposition, attaching a twenty-pound weight to the leg. Three days afterwards I reduced the weight to ten pounds, and on August 8th Smith's anterior splints were applied. One ounce of whiskey was given three times a day. The patient improved under the treatment adopted. On August 16th, the splint was readjusted, and again on September 1st, when the wound was found to look well and healthy and to be still discharging laudable pus. After this, tincture of iron in doses of fifteen drops was given in addition to the whiskey, and on September 6th the ligature was removed. On September 8th, the patient complained of sharp shooting pains around the wound, extending downward to the knee; he was placed under chloroform, and an incision one and a half inches long was made behind the exit wound, through which four or five small pieces and one large piece of bone were removed. Considerable hæmorrhage ensuing, persulphate of iron was injected in the wound, after which the leg was again placed in a splint. By September 12th, the patient was again improving. On October 10th, the wound was still discharging freely, and the thigh was much swollen and very painful. The patient was also suffering from a rather troublesome diarrhœa. On November 10th, when he was transferred to Baltimore, his wound was still suppurating freely, but his general health was improving and union of the fractured bone was firm, so that he could bear about one-twelfth of his weight on the injured limb." In Baltimore, the patient was admitted to West's Buildings Hospital, and two months later he was transferred to Point Lookout. Surgeon A. Heger, U. S. A., in charge of the latter hospital, reported that the man died, from the effects of the fracture of the femur, April 13, 1864.

TABLE XLIX.

Summary of Twenty-one Ligations of the Femoral Artery in Cases of Shot Fractures of the Femur treated by Conservation.

No.	NAME, MILITARY DESCRIPTION, AND AGE.	DATE AND DESCRIPTION OF INJURY.	HÆMORRHAGE.	LIGATION AND OPERATOR.	RESULT AND REMARKS.
1	Union Lieutenant.	Comminuted fracture upper third of femur. Harrisburg, Miss., July 14, 1864	Femoral artery sloughed.	Ligation of femoral artery.	Complete recovery. Exch'd. *C.S.A.Med.and Surg.Jour.*, Jan., 1865, Vol. II, p. 9.
2	*Smith, F. A.*, Pt., G, 4th Alabama, age 24.	Conoidal ball fract're of lower third of left femur. Gettysburg, July 2, 1863.	.....	Ligation of femoral.	Exchanged April 27, 1864.
3	Wright, M., Pt., F, 25th Indiana, age 18.	Conoidal ball fractured portion of external condyle of right femur and passed thro' popliteal space. Savannah, Dec. 11, 1864.	Suppuration fetid; severe hæmorrhage from vessels in neighborhood of popliteal space; controlled temporarily by plugging.	January 2, 1865, ligation of femoral artery; Scarpa's triangle, by Acting Ass't Surgeon E. L. Mola.	Incision healed: ligatures came away on January 14. Discharged July 8, 1865. *U. S. San. Com. Memoirs*, Surg. Vol. I. p. 263.
4	*Brooks, A. M.*, Lieut., A, 26th Virginia.	Pistol ball fracture of lower third right femur. Burksville, April 6, 1865.	April 17, hæmorrhage caused by a sharp spicula of bone piercing the popliteal art'ry.	April 17, ligation of femoral artery below origin of profunda.	Died April 20, '65. *Post-mortem:* ant. wall of artery had sloughed $\frac{3}{8}$ths of an inch. *A. M. M., Specs.* 4084, 4085.
5	*Campbell, J. W.*, Pt., A, 17th Virginia, age 23.	Conoidal ball fracture of upper middle and lower thirds of femur. August 4, 1864.	August 13, hæm. amounting to 60 ounces from femoral.	August 13, ligation of femoral artery in continuity in Scarpa's space.	Hæm. did not recur, but patient died of exhaustion from loss of blood, Aug. 13, '64.
6	Campbell, S., Pt., H, 140th Penn., age 30.	Conoidal ball fractured upper third right femur, also wound of the left thigh, etc. May 29, 1864.	June 10, hæm. 8 oz.; profunda ligated and ligature placed under the femoral. June 13, hæm. recurred, 2 oz.	June 13, ligature around the femoral artery by Assistant Surg. W. Thomson, U.S.A.	Died June 13, 1864; asthenia. *A. M. M., Spec.* 3557.
7	Cox, T. C., Pt., G, 88th New York.	Conoidal ball comminuted fracture of upper third of left femur. Fredericksburg, Dec. 13, 1862.	January 9, 1863, severe hæmorrhage, controlled by cold water and compress. January 10, recurred.	January 10, ligation of femoral artery by Acting Ass't Surgeon R. Carroll.	Died Jan. 10, 1863; autopsy; artery torn for an inch or more, apparently by sloughing.
8	Coder, D., Corp'l, F, 16th Pennsylvania Cavalry, age 23.	Shot entering immediately over femoral artery, right thigh, splintering trochanter minor. Hanover C. H., May 28, 1864.	June 8, hæmorrhage amounting to 5 oz. from femoral. June 9, hæmorrhage recurred, 8 ounces.	June 9, ligation of femoral artery below profunda by Ass't Surgeon W. Thomson, U. S. A.	Died June 10, 1864; exhaustion and gangrene; autopsy.
9	Detweiler, C., Pt., A, 47th Pennsylvania, age 24.	Conoidal ball wound of left thigh, injuring femur in the middle third. Cedar Creek, Oct. 19, 1864.	Extensive sloughing March 5, 1865; hæm. 8 ounces from branch of ext. circumflex; lig. of profunda. March 9, femoral sloughed; hæmorrhage 20 oz.	March 10, 1865, ligation of femoral artery in continuity in Scarpa's triangle, one inch below origin of profunda, by A. A. Surgeon W. P. Moon.	Died March 10, '65; exhaustion. *A. M. M., Spec.* 1357.
10	*Dunn, B. M.*, Pt., D, 1st Louisiana.	Conoidal ball severing femoral artery and fracturing middle third of right femur. Gettysburg, July 2, 1863.	.....	July 2, ligation of the femoral in Scarpa's triangle.	Sept. 6, ligature rem'd; considerable hæm., arrested by persulp. iron. Died April 13, 1864.
11	Floyd, J., Serg't Major, 13th Pennsyvania Cav., age 32.	Conoidal ball comminuted fracture upper third of left femur. May 28, 1864.	June 19, neighborhood of wound much disorganized; hæmorrhage from profunda, 30 ounces.	June 19, ligation of femoral in continuity just below Poupart's ligament by Act. Ass't Surg. J. Newcombe.	June 20, 21, bleeding recur'd. Died June 25, 1864; hæmorrhage.
12	Freeman, A., Pt., H, 61st New York, age 19.	Partial fracture in the upper third of the left femur by conoidal ball. Antietam, Sept. 17, 1862.	Nov. 3, profuse hæmorrhage from femoral artery.	November 3, ligation of femoral artery.	Died November 24, 1862; exhaustive suppuration. *A. M. M., Spec.* 740.
13	Geitz, H., Pt., C, 15th New York Heavy Artillery, age 26.	Conoidal ball fracture right thigh. May 18, 1864.	May 29, hæmorrhage from profunda artery.	May 30, ligation of femoral artery in continuity by Surgeon D. W. Bliss, U. S. V.	June 7, hæm. recurred. Died June 8, 1864.
14	Harper, J., Pt., B, 16th Infantry.	Shot fracture of right thigh. Stone River, Dec. 31, 1862.	.....	Ligation of femoral artery.	Died February 14, 1863.

No.	Name, Military Description, and Age.	Date and Description of Injury.	Hæmorrhage.	Ligation and Operator.	Result and Remarks.
15	Johnson, V., Pt., I. 13th Indiana, age 22.	Conoidal ball fracture upper third of left thigh (also wound right). Petersburg, May 9, 1864.	May 19, hæmorrhage from profunda; ligated in continuity; hæm. recurred May 22; 26 ounces.	May 22, ligation of femoral artery above profunda.	May 24, hæmorrhage recurred. Died May 26, 1864.
16	*Kelly, J. A.*, Lieut., C., 9th Missouri.	Shot fracture upper third left femur. July 4, 1863.	July 12, 13, hæmorrhage, 7 ounces, from profunda.	July 13, ligation of the femoral artery.	Died July 13, 1863.
17	Parker, J., Corp'l, H, 58th Mass., age 38.	Conoidal ball fracture of middle third of the left femur.	Hæmorrhage.	June 27, ligation of femoral artery.	Died July 2, 1864.
18	Root, J. L., Pt., H, 77th New York, age —.	Conoidal ball fracture, splintering left thigh. Cedar Creek, Oct. 19, 1864.	.....	October 19, ligation of the femoral artery.	Died November 1, 1864.
19	*Sexton, J. M.*, Pt., A, 4th Virginia Cavalry, age 22.	Conoidal ball comminuted fracture mid. third of right femur. Monocacy, July 9, 1864.	August 5, femoral artery sloughed; hæmorrhage 10 ounces.	August 5, ligation femoral in continuity below profunda, above wound, by Act. Ass't Surgeon J. H. Coover.	Aug. 6, hæm. recur'd, 12 oz.; ligation of profunda. Died from exhaustion and loss of blood. *A.M.M., Spec.* 3971.
20	Smith, D. R., Pt., I, 93d Illinois.	Shot fracture of the right femur. Mission Ridge, November 25, 1863.	.....	November, 1863, ligation of femoral art'y by Ass't Surg. J. S. Prout, 26th Missouri.	Died December 5, 1863.
21	Walter, V., Pt., E, 8th Ohio, age 24.	Conoidal ball fracture upper third of right femur. Spottsylvania, May 10, 1864.	June 7, hæmorrhage, 16 oz., from femoral artery.	June 9, ligation of femoral artery above profunda.	Died June 17, 1864.

The profunda was successfully tied in one case, and the circumflex of profunda and the popliteal arteries[1] were unsuccessfully ligated in one instance each. In one case it is stated that the femoral vein was successfully ligated on the day of the injury; but unfortunately neither the records of the field hospital nor of the Columbian Hospital at Washington, where the patient was treated during the first five months after the injury, allude to the ligation of the femoral vein, and not until the soldier reached the hospital at Madison, Wisconsin, is the operation, said to have been performed on the field, mentioned, probably upon the patient's own statement. A brief account of the case is appended:

Case 501.—Corporal G. Bulman, Co. G, 36th Wisconsin, aged 22 years, was wounded through the upper third of the left thigh, at Hatcher's Run, October 27, 1864. He was sent from the field to Columbian Hospital, Washington, several days after the injury, and five months later he was transferred to Harvey Hospital, Madison. Surgeon H. Culbertson, U. S. V., in charge of the latter, reported that the femur was fractured by the missile, and that the femoral vein had been ligated on the day of the injury. The patient was discharged from service May 22, 1865, and pensioned. Examiner W. H. Walker, of Fond du Lac, certified, August 11, 1865: "He was wounded by a ball through the upper third of the thigh from without inward, fracturing the femur. The muscles are adherent and the thigh is diminished in circumference two and a half inches. The circulation of the limb is much impeded from extensive loss and induration of the soft parts from hospital gangrene." Several years after the same examiner reported "deep and extensive varices and ulceration on the outer aspect of the calf" from the obstruction of the circulation of the limb. The pensioner was paid December 4, 1879.

A fatal instance of ligation of the femoral vein and the profunda artery for secondary hæmorrhage is reported by Acting Assistant Surgeon T. J. Dunott:

Case 502.—Private E. Gilkey, Co. C, 17th Maine, age 27 years, was wounded at Petersburg, June 18, 1864, and admitted into Campbell Hospital, Washington, ten days afterwards. Surgeon A. F. Sheldon, U. S. V., reported: "Shot fracture of upper third of right femur. Hæmorrhage to the amount of twelve ounces occurred on July 5th, when the femoral vein and the profunda artery were ligated, the ligature of the former being applied at the seat of the injury. Hæmorrhage recurred on July 7, 1864, when the case resulted fatally."

Among the three thousand four hundred and sixty-seven cases of shot fracture of the femur treated by conservation referred to in this Section, were two thousand eight hundred and thirty-nine Union and six hundred and twenty-eight Confederate cases. The ratio of

[1] Surgeon G. M. B. Maughs, P. A. C. S. (*Conservative Treatment of Compound Comminuted Fracture of the Femur, with Cases*, in *Confederate States Med. and Surg. Jour.*, 1865, Vol. II, p. 9), reports that Private *W. T. Ivy*, 19th Mississippi Cavalry, aged 40, was wounded at Harrisburg, July 14, 1864; compound comminuted fracture of femur, upper third; ligation of arteria profunda; treated by position; union complete; shortened one inch. Acting Assistant Surgeon T. J. Dunott reports that Private E. H. Gibson, Co. A, 14th New Jersey, aged 15, was wounded at Monocacy, July 9, 1864. A conical ball perforated the right thigh in the upper third, on the anterior aspect, fractured the femur without producing much comminution, and emerged near the anus. The patient was admitted into the hospital at Frederick, and, on July 13th, the limb was placed upon a double-inclined plane. On July 19th, hæmorrhage set in, a large and continuous stream flowing out of the anterior wound. Dr. Dunott immediately enlarged the wound and tied the circumflex of the profunda above and below; on July 20th, violent hæmorrhage occurred from the wound. Compression was made at once, and a plug of lint introduced. A hot-air bath was ordered and stimulants given, but the patient died July 19, 1864, two hours after the recurrence of the hæmorrhage. Surgeon R. Nicolls, U. S. V., reports that Private C. A. Knight, Co. L, 2d Illinois Cavalry, aged 24, was accidentally wounded at Sikeston, Missouri, May 4, 1862, by a pistol ball, which fractured the left femur three inches above its lower extremity. He was admitted into the hospital at Quincy on May 10th, and the popliteal artery, which was wounded, was ligated above and below the wound. Buck's apparatus was applied. The ligatures came away on the fourteenth day. The wound of operation had nearly closed by the latter part of August, but the patient was reduced by diarrhœa and died September 29, 1862.

mortality of the completed cases was 51.1 per cent. on the Union, and 44.0 per cent. on the Confederate side, as exhibited in the following table:

TABLE L.

Numerical Statement of Union and Confederate Soldiers treated by Conservation after Shot Fracture of the Femur.

POINT OF FRACTURE.	TOTAL CASES.	UNION SOLDIERS.					CONFEDERATE SOLDIERS.				
		Cases.	Recoveries.	Deaths.	Undetermined.	Ratio of Mortality of Determined Cases.	Cases.	Recoveries.	Deaths.	Undetermined.	Ratio of Mortality of Determined Cases.
Fracture of Upper Third	1,254	1,036	551	480	5	46.5	218	118	92	8	43.8
Fracture of Middle Third	855	699	421	274	4	39.4	156	79	68	9	46.2
Fracture of Lower Third	620	502	304	192	6	38.7	118	71	40	7	36.0
Point of Fracture not specified	738	602	85	480	37	84.9	136	60	58	18	49.1
Aggregates	3,467	2,839	1,361	1,426	52	51.1	628	328	258	42	44.0

The rate of fatality among the Confederates as exhibited in this table is remarkably low; but it must be taken into consideration that in the enumeration of the Union cases, made up to a large extent from the casualty lists of the various corps, are included even those patients who died within the first few hours after the reception of the injury, before means of transportation could reach them, while the Confederate cases of a similar nature do not appear in these statistics.[1]

Excisions in the Shaft of the Femur.—Although the number of excisions in the shaft of the femur practised was comparatively large, little need be said about the operation, which, as already stated, was generally considered with disfavor by the American surgeons, and frequently those who had practised it became its strongest opponents.[2]

Amputations in the Thigh.—While the experience acquired during the War of the Rebellion indicates that the attempts to save the limb after shot fractures of the femur have, in many instances, met with favorable results, there are a large number of cases in which primary amputation remains the only alternative. When the fracture of the femur is accompanied by great comminution, or by extensive longitudinal fissuring, or by grave laceration of the soft parts, or by primary injury of the femoral artery or vein, the limb should be removed at once. Furthermore, the crowded condition of the field hospitals after large engagements, the infectious diseases likely to arise, the scarcity, and sometimes

[1] In the *Confederate States Medical and Surgical Journal*, Richmond, June, 1864, Vol. I, p. 89, will be found a consolidated statement of compound fractures of the femur treated without operation, compiled from the records of the Confederate Surgeon General's Office from June, 1862, to February 1, 1864, inclusive. The total number of cases treated was 221, of which 116 recovered, and 105 or 47.5 per cent., had a fatal termination.

[2] Surgeon C. A. COWGILL, U. S. V., who excised a portion of the shaft of the femur in the case of Private I. W. Hall, 92d New York (TABLE XXVI, No. 17, p. 210, *ante*), writes, in a letter to the editor dated Dover, Delaware, July 12, 1866: "The result of this case determined me never to attempt again to save a femur fractured by a gunshot wound by excising any portion of its continuity. The extraction of fragments almost entirely detached and displaced is all that I would do in a similar case. In severe injuries where there is no hope of saving the limb, the fracture involving the upper third, I would prefer waiting for some weeks until all primary irritation had subsided, and a degree of tolerance acquired by the system, and then *amputate*, believing that *secondary* amputations are more frequently followed by successful results when performed in the upper third of the femur than is the case when operations are performed immediately following the injury. The result has been equally unfavorable in formal excisions of the continuity of the humerus where there has been much shattering of bone and injury to the soft parts. There is danger of extensive sloughing, secondary hæmorrhage, and pyæmia following these operations, causing loss of life or necessitating a subsequent amputation. Conservative surgery is very popular in theory, but frequently dangerous to life when permitted to be the sole guide in practice." Surgeon A. F. SHELDON, U. S. V., who operated in Cases Nos. 12, 18, 22, and 25 of TABLE XXVI, p. 210, *ante*, in a letter to the editor dated July 5, 1866, remarks: "The prospects of recovery would have been much better in the enlisted men had no operation been performed. I should now excise very seldom in any part of the body, and I have never seen a case where excision of a portion of the femur in the continuity was performed, where I think the patient was benefitted by it." Surgeon W. H. TWIFORD, 27th Indiana, who excised in the cases of Private Wishmire, 27th Indiana (TABLE XXIV, No. 61, p. 206, *ante*), and Private Wilson, 13th New Jersey (TABLE XXV, No. 9, p. 208, *ante*), in a letter to the Surgeon General dated July 27, 1866, advises primary amputation rather than excision, providing the patient is able to bear up under the shock of the amputation, and remarks: "I am therefore opposed to excision of the shaft of the femur unless the exigencies of the case demand it." Surgeon A. J. PHELPS, U. S. V., in his *Report of the Operations of the Medical Department of the Left Wing of the Fourteenth Corps at the Battle of Murfreesboro'*, in *Appended Documents to Part I, Vol. I, Med. and Surg. History of the War of the Rebellion*, Washington, 1870, p. 260, says: "I consider exsections in the case of the shaft of the femur should very generally give way to amputation."

entire want, of surgical appliances to make the patient with a fractured thigh bone comfortable, the rough transportation to which the wounded man is liable to be exposed, are circumstances which will sometimes urge the military surgeon to forego all conservative inclination and prefer to sacrifice the limb rather than to expose the patient to the risks attending the attempts at preservation. Here, as well as in all questions of surgical interference, medical officers in the field will always be guided by the circumstances surrounding each case.

The modes of operating employed were the flap method[1] and its various modifications—the anterior, posterior, antero-posterior, and lateral flaps—in one thousand one hundred and forty-one, the circular method in eight hundred and sixty-three, the oval flap with circular division of muscles in one hundred and eight instances; but it is difficult to draw correct conclusions from the recorded cases regarding the value of the modes practised. Surgeon E. Batwell,[2] 14th Michigan Volunteers, observes: "The sort of operations performed is worthy of comment, and has been very closely watched, to try and give a preference to either circular or flap operations, based on observations as to their relative merits as far as healing was concerned; but no difference was discernible, except in lateral flaps, where the protrusion of the bone through the incision prevented the rapid union that took place in the antero-posterior ones. The only cases in which the healing process seemed retarded were those in which the operation urged by Malgaigne was performed—oval flaps with circular division of muscular tissue. The chief points in which they seemed to be deficient was the small anterior flap being unable to support the weight of the posterior larger one. This again granulated very freely, and thereby prevented approximation of the edges, and a large granulating surface was the result, instead of the nicely adjusted linear mark observable in either the flap or circular operations. From the observations made on the subject, I would urge that no modifications are worthy of being noticed by surgeons, and that the circular or flap operations amply fulfil all the requirements necessary." The Army Medical Museum possesses seventy-nine casts of stumps after amputations in the femur, six of which are shown in the accompanying plate (PLATE LXXIII). FIGURES 1, 2, 3, and 5 represent stumps after the anterior, posterior, antero-posterior, and lateral flap methods, FIGURE 4, after the circular method, and FIGURE 6, after an operation by the flap of skin and circular division of muscles method. An amputation after the method of Gritti,[3] of Milan, is reported by Surgeon W. Child,[4] 5th New Hampshire Volunteers, to

[1] Surgeon A. J. PHELPS, U. S. V., in his *Report of the Operations of the Medical Department of the Left Wing of the Fourteenth Corps, at the Battle of Murfreesboro'*, remarks: "The method of amputation employed was, very generally, the flap. Those cases of flap operation, however, that approached nearest to the circular method did best, and I have thought that our success would be greater if the circular method was adopted more generally. The only hope we have of an entire success is union by the first intention in the flap operation, and this depends upon the subsequent attention of the surgeon. We can seldom expect to realize it while we have to depend upon inexperienced nurses for dressers. The weight of an unsupported flap will invariably break those tender bonds of union that nature so readily attempts. (*Appended Documents to Part I, Vol. I, of the Med. and Surg. Hist. of the War.* Washington, 1870, p. 262.)

[2] Extract from a *Report on the Surgical Operations performed after the Engagement at Jonesboro', Georgia*, in *Appended Documents to Part I, Vol. I, of the Med. and Surg. Hist. of the War*, Washington, 1870, p. 304.

[3] R. GRITTI (*Dell amputazione del femore al terzo inferiore e della disarticolazione del ginocchio. Valore retativo di cadanna coll' indicazione di un nuovo metodo denominato amputazione del femore ai condili con lembo patellare*, in *Annali Universali di Medicina*, Milano, 1857, Vol. CLXI, p. 5. This operation will be referred to in the succeeding section.

[4] CHILD (W.), GRITTI'S *Supra-condyloid Amputation of the Thigh*, in the *Boston Med. and Surg. Jour.*, 1879, Vol. CI, p. 783. Dr. CHILD says: "After the battle of Antietam (September 17, 1862) it was determined to establish upon that battle-field a hospital for such severe cases as could not be conveniently removed to the general hospitals. Dr. BERNARD VANDERKIEFT, United States volunteer surgeon, was detailed surgeon in charge of this hospital. Among the patients was a soldier with an amputation of the right leg. After some weeks it was found that the leg must be amputated at or above the knee joint. Dr. VANDERKIEFT decided to amputate at the knee joint by "*a new operation*" (as he said), and the operation was certainly new to his associates and assistants. He made a circular incision from the internal tuberosity of the tibia across the leg below the patella to the head of the fibula, dissected this flap up to about the middle of the patella, cut through the ligamentum patellæ close to the lower border of the bone, and turned back the flap. He then made the posterior flap by passing the knife beneath the femur and cutting outward and downward. He then sawed through the femur just above the condyles, and removed a section from the posterior or internal surface of the patella by the saw. Next he adjusted the sawn surface of the patella to the sawn extremity of the femur and adjusted the flaps in the usual manner. The patient died in about sixteen hours, on account of previous exhaustion."

have been performed by Surgeon B. A. Vanderkieft, U. S. V., who was in charge of the Smoketown Hospital after the battle of Antietam, September 17, 1862. Another operation of this character was performed by Assistant Surgeon J. W. S. Gouley, U. S. A., December 16, 1862, three days after the battle of Fredericksburg:[1]

FIG. 219.—The lower half of right femur amputated above the condyles. *Spec.* 536.

CASE 503.—Private Grey Y. Barrett, Co. F, 5th New Hampshire, aged 20 years, was wounded at Fredericksburg, December 13, 1862, by a musket ball, which entered at the outer condyle of the femur, passed inward and upward, and, escaping posteriorly in the middle of the lower third of thigh, left the bone much comminuted at its exit. He was admitted to the hospital of the 1st division, Ninth Corps, where, on December 16th, Assistant Surgeon J. W. S. Gouley, U. S. A., amputated the femur a short distance above the wound of entrance, the patella being included in the anterior flap; the line of section not having escaped the wound, another third of an inch was removed (FIG. 219); the femoral surface of the patella was then sawn off, and the two cut surfaces of the bone were brought in apposition (FIG. 220). The laminated portion of the femur, however, was fractured half an inch above this point, and fissures extended two inches further. The operation was well borne, and the case continued to do well until the sixth day, when sloughing commenced; on the eighth, signs of gangrene were noticed; and, on the ninth, December 25th, Surgeon J. P. Prince, 36th Massachusetts Volunteers, amputated the femur in the middle third, on account of the burrowing of pus, for secondary hæmorrhage from the popliteal. No plastic deposit could be observed immediately after the operation. On the next day he was transferred to Washington, and admitted to the Douglas Hospital, where he died on December 27, 1862. The pathological specimen, which was contributed to the Army Medical Museum by Dr. Prince, with a history of the case, is numbered 536 of the Surgical Section.

FIG. 220.—The same with the sawn surfaces of the patella and femur in apposition.

Extension as a means of covering protruding bones after amputation of the thigh was successfully employed at the City General Hospital, St. Louis, after a plan[2] devised by Acting Assistant Surgeon A. S. Barnes.

How far the size of the thigh presented for amputation influences the result of the operation cannot be ascertained from the cases recorded in the preceding pages. M. Brasdor,[3] in 1774, observed that "plus la plaie de l'amputation a de surface, plus, toutes choses, égales, le danger que court le malade est grand," and Surgeon M. Goldsmith, U. S. V.,[4] in a letter to this Office notices the influence of the size of the limb upon the mortality of

[1] An account of this case by Surgeon JAMES P. PRINCE, 36th Massachusetts Volunteers, has been published in the *Boston Medical and Surgical Journal*, 1863, Vol. LXVIII, No. 4, p. 69, and by Dr. ROBERT F. WEIR in his excellent paper *On* GRITTI'S *Supra-Condyloid Amputation of the Thigh*, in *The Medical Record*, New York, 1879, Vol. XV, p. 338.

[2] HODGEN (J. T.). Letter to the Surgeon General, dated April 30, 1863: "The accompanying drawing (FIG. 221) shows its application to the thigh. The same is also applied to the arms, forearms, or legs. From three to six adhesive strips are applied, extending from the end of the stump up the limb to near the next joint; this is then covered by a smoothly applied bandage. The free ends of plaster are brought together several inches below the end of the stump and fastened by a cord, to which is attached a bag of sand weighing from 1 to 3 or 4 pounds; the cord, passed over a pulley placed at a proper point on the bedstead, the bag is suspended, thus making gradual constant extension on the flaps, which soon elongate and cover the protruding bone. Great numbers of such stumps have been brought to this hospital, in many the bone protruding three inches or more, and in but one case have we thought it best to saw off the end of the bone; and that was done before this method of treatment was practised. There have been very few cases in which the ends of bones have exfoliated, and then only a small part of what would have been lost if the usual course had been pursued. The credit of introducing this new method of covering protruding bones is due to Acting Assistant Surgeon A. S. BARNES of this city." Dr. W. W. KEEN, jr., in a letter to the Surgeon General's Office, dated U. S. A. General Hospital, West Philadelphia, May 26, 1863, ascribes this plan to Assistant Surgeon A. H. SMITH, U. S. A: "Assistant Surgeon A. H. SMITH, U. S. A., who was with me at Frederick, and afterwards here and now at Nashville, while at Frederick devised a very ingenious apparatus, which was afterwards adopted at hospitals nearer the battle-fields, and there claimed as original, and now, I learn, is claimed by J. T. HODGEN, Surgeon U. S. V., of St. Louis. The apparatus is the application of adhesive strips to the flaps after amputation (especially in the thigh), and the attaching to them of a weight running over a pulley, very much after the plan of BUCK'S apparatus for the thigh, the object being to prevent retraction of the flaps, and to overcome it if already established."

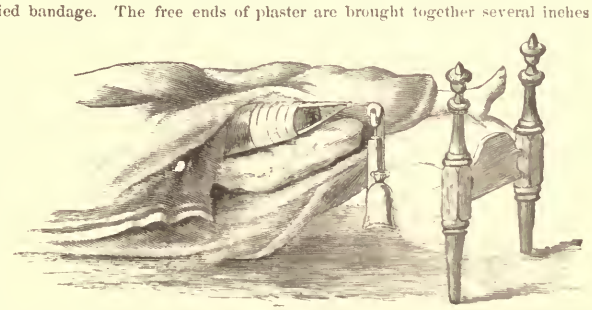

FIG. 221.—Dr. A. S. BARNES'S method of treating amputations with retracted flaps.

[3] BRASDOR. *Essai sur les amputations dans les Articles*, in *Mém. de l'Acad. Roy. de Chir.*, Paris, 1774, T. V, p. 757.

[4] GOLDSMITH (M.). Letter to the Surgeon General, dated Jeffersonville, Indiana, October 18, 1865: "It has been a subject of general remark in the Army that a much larger proportion of the lean, lithe, active men—hardy men, without a particle of encumbering fat, recovered from amputation, than equally hardy men—men oftentimes of much more muscular development and strength, with a larger accumulation of fat. Or, in other words, that small, light, active men, bore amputation of the thigh better than larger, stronger, and stouter men did. That other things being equal, the general

amputations, especially in the thigh, a subject which seems to him of "importance enough to challenge the attention of medical men."

Considering the results of the amputations according to the ages of the patients, as represented in TABLE LI, the mortality rate of four hundred and seventy-six patients under twenty years of age was 41.0 per cent.; of thirteen hundred and fifty-one patients

health of the two classes being alike, the injuries and subsequent exposures being the same, the mere size of the limb, controlling as it does the area of the traumatic surfaces, came to be the ruling element in the determination of the question of amputation in line cases. Professor BUSH, of the Transylvania University, was sent by the Governor of Kentucky to the succor of the wounded at the battle of Shiloh. He tells me that among those with amputated thighs, very few large fleshy men recovered, while much the larger proportion of those having small, lean, muscular limbs, arrived at Louisville in good condition. He was so much struck with this observation, that out of it he has drawn for himself a clinical rule, in determining the question of amputation, not a dominating rule, but one having much to do with the question. Dr. BUSH'S observation is all the more pertinent that it was an independent one. All of the leading surgeons with whom I have conversed upon the subject have made concurrent observations. For myself, I have been so impressed with the influence of the mere size, volume, or thickness of the limb presented for amputation, that in cases where the question was debatable the decision in the wavering balance was determined by the extent of traumatic surface necessarily incident to the operative procedure required. This consideration had all the more weight as the line of the contemplated division approached the trunk."

UNIVERSITY OF CALIFORNIA

Section IV.

WOUNDS AND INJURIES OF THE KNEE JOINT.

The injuries of the knee joint to be considered in this Section number three thousand four hundred and forty-nine. Twelve were punctured, thirty-nine incised, and three thousand three hundred and ninety-eight shot wounds. Of the latter, forty-three were shot contusions and three thousand three hundred and fifty-five shot fractures. The injuries of the knee from blows, falls, or railroad accidents are reserved for a future chapter. The number of cases of injuries of the knee joint followed by amputations of the thigh is very large. Of the thirty-nine patients with incised wounds, six submitted to amputation; of the forty-three shot contusions, ten, and of the three thousand three hundred and fifty-five shot fractures, two thousand three hundred and eighty-nine were succeeded by amputation in the thigh. The two thousand three hundred and ninety-nine cases of amputation in the thigh for shot contusion or shot fractures of the bones of the knee joint have already been cited in the amputation tables of the preceding section, and will therefore be only briefly alluded to in the concluding remarks of this Section.

PUNCTURED AND INCISED WOUNDS OF THE KNEE JOINT.—The instances of punctured and incised[1] wounds of the knee joint reported on the records number fifty-one—twelve punctured wounds and thirty-nine incised wounds. In some of the cases, undoubtedly, the cavity of the joint was directly implicated, but the meagre evidence

[1] Examples of punctured and incised wounds of the knee joint by bayonet, sword, or sabre, in military surgery, are not frequent. RAVATON (*Chirurgie d'Arm'e ou Trait' des plaies d'armes à feu et d'armes blanches*, Paris, 1768, p. 522. *Obs.* XXXVI) cites the case of Cuirassier Til, of Lulliers Company, who received, in 1761, a sabre puncture of the right knee opening the joint. The patient recovered. The author adds: "The bones of the thigh and the leg were anchylosed on account (doubtless) of the little attention paid to passive motion of the extremity." BRUNEAU (P.) (*Diss. sur les plaies des articulations*, Paris, Thèse, An XI [1802] p. 14) reports the case of a young man who received a sabre wound of the knee, dividing the patella and laying open the articular surfaces. The wounded parts were brought together, but tumefaction and fever, with intense pain, swelling, and abscesses followed, and death ensued. RABASSE (L. J.) (*Considérations Générales sur les plaies des articulations faites par les armes à feu ou les instrumens tranchans*, Paris, Thèse No. 84, 1811, p. 20) records two cases of sabre wounds of the knee joint: Maker, 84th line, who received, near Utrecht, in 1804, a sabre wound which cut the upper ligament of the right patella and penetrated the articulation. The parts were brought together and cataplasms employed. Abscesses formed on the interior and exterior sides of the knee, which were opened, and a seton was introduced to allow the escape of pus. The wounds healed and the patient recovered, but with complete anchylosis of the knee joint. A grenadier of the 54th regiment received, in a duel, a sabre wound just above the knee, running transversely and a little upward, and dividing the tendons of the extensor muscles of the leg near their insertion on the upper part of the patella: the articulation was opened. The wound was about three inches long and presented an opening into which a finger could be readily introduced. Union of the parts was maintained by bandages and a splint applied to prevent flexion. Union took place, and the patient recovered without accident. BLONDEAU (JEAN) (*Propositions de l'athologie fondées sur des Observations*, Thèse, Paris, 1815, No. 64. p. 21) describes the case of a sergeant of the 122d regiment, who received, in a duel near Salamanca, a sabre wound of the knee, which cut the patella transversely and penetrated to the middle of the condyles of the femur. A splint was placed at the posterior part of the limb and the wounded surfaces brought together. He had nearly recovered when he fell a victim to an adynamic fever. LARREY (D. J.) (*Mémoires de Chirurgie Militaire et Campagnes*, Paris, 1812, T. II, p. 475) records the following: Grenadier J. Grandi received an incised wound of the right knee, which divided the patella through the whole of its thickness and involved the condyles of the femur. Extravasation of blood into the joint and suppuration and disorganization of the soft parts took place; the femur was denuded and the cartilages destroyed; death resulted. Jean Lepaix, a grenadier, aged 30, received a sabre wound of the right knee. He walked two leagues to the hospital. The incision was about three centimetres long, running obliquely downward, opening the joint and allowing synovia to escape. Amputation was proposed but refused by the patient. The edges of the wound were united to exclude the air and prevent extravasation of blood. The usual remedies were employed without benefit. The soldier demanded amputation, which was performed on the fifth day. The patient died on the fifteenth day. LARREY adds that he saw several patients with similar wounds, who perished because amputation had not been risked. DEGUISE (J. F. C.) (*Dissertation sur les plaies des articulations*, Paris, 1815, Thèse No. 4, p. 10) cites the case of Adju't Major M. Des—, 41st regiment, who received, during the Russian campaign, in 1812, a sword thrust of the knee joint, allowing the escape of synovia. The parts were drawn together and the wound healed by first intention, without pain; "in spite of the cruel fatigues experienced on the retreat through Silesia, the healing was complete in a few days." EHRLICH (J. A.) (*Chirurgische Beobachtungen*, Leipzig, 1815, B. II, pp. 106, 109) records two cases of sabre wounds of the knee: A soldier of the 21st Chasseurs, aged 16, received, on August 4, 1813, a sabre wound of the knee. There was considerable hæmorrhage, and synovia escaped freely.

and the fact that the injuries in several of the cases healed with very slight inflammatory action render it possible that they were periarticular wounds only.

Punctured Wounds of the Knee Joint.—The twelve punctured wounds of the knee joint terminated in recovery. Seven were caused by bayonets, two by knives, two by falls on nails, and one by a fall on a pair of scissors. The seven cases of bayonet wounds are:

CASE 504.—Private C. Smith, Co. H, 30th Iowa, aged 17 years, received, September 20, 1862, a bayonet puncture of the left knee joint. He was discharged from service at Benton Barracks Hospital, October 5, 1863, Surgeon J. H. Grove, U. S. V., certifying to "anchylosis and chronic synovitis" resulting from the wound. His claim for pension was rejected.

CASE 505.—Private J. S. Oldscamp, Co. K, 16th Maine, aged 22 years, was wounded and captured at Spottsylvania, May 8, 1864. He was subsequently exchanged, and ultimately discharged for disability June 22, 1865. Examiner C. Rowland, of Brooklyn, New York, reported: "A bayonet wound penetrated the right knee; also a shot wound of right thigh, and of right foot injuring the little toe. The result is lameness and inability to labor." The man was a pensioner until March 4, 1866, when he was dropped, his disabilities, in the opinion of the examiner, having ceased.

CASE 506.—Surgeon W. O'Meagher,[1] 37th New York, reports: "Private ——— received an accidental wound of the knee joint between the border of the patella and the internal condyle of the femur. At first little was thought of it, a few adhesive straps and a roller bandage being applied, and the patient returned to duty. In a few days, owing, doubtless, to imprudence and over exercise, inflammation, accompanied by pain, fever, swelling, and effusion, set in, while the wound assumed an angry fungoid appearance; but by means of rest in the recumbent position, elevation of the extremity, and water dressing, the pain and other symptoms slowly abated at the end of three weeks, leaving the patient, however, lame and stiff at the joint."

CASE 507.—Musician J. H. Getman, Co. E, 115th New York, aged 19 years, was wounded at Fort Fisher, January 16, 1865. He was conveyed to McDougall Hospital, New York, and subsequently to Troy. Surgeon George H. Hubbard, U. S. V., in charge of the latter hospital, reported that the patient's injuries consisted of "a bayonet wound of the posterior portion of the right knee joint." Getman was furloughed April 28th, and was mustered out of service May 19, 1865; he is a pensioner.

CASE 508.—Sergeant S. M. Ingraham, Co. K, 64th New York, aged 34 years, received a bayonet wound of the left knee, at Spottsylvania, May 12, 1864. He was mustered out and pensioned October 13, 1864. Examining surgeons represent him as suffering from permanent weakness of the knee as a result of a bayonet wound of the patella followed by suppuration.

The remaining two cases of bayonet wounds of the knee joint have already been cited, viz: cases of Private C. A. Ball, Co. K, 89th New York (CASE 3, page 6, *ante*), and Private Lewis Francis, Co. I, 14th New York (CASE 331, page 154, *ante*). The former recovered without any bad results; the latter after amputation in the middle third of the thigh and subsequent disarticulation at the hip.

Amputation above the knee was advised, but refused by the patient. The arteries were ligated and the edges of the wound drawn together by sutures, care being taken that synovia and blood were allowed to escape. August 6th, inflammation, swelling, and pain. Synovia continued to escape until August 10th. Death from exhaustion August 23, 1813. A soldier of the 7th line, aged 27, received, on August 16, 1813, near Dresden, a sabre cut through the left patella. He secured the wound with bandages, and was received into the military hospital on August 24th, very much exhausted. An examination revealed a cut about 4 inches in length, splitting the patella and opening the joint; blood and synovia escaped freely and symptoms of tetanus appeared. August 28th, escape of synovia diminished. September 19th, cut edges of patella were united and the escape of synovia had ceased. The patient recovered. LEFRANCOIS (JEAN) (*Dissertation sur les plaies pénétrantes de l'articulation du genou*, Paris, 1820. Thèse No. 28, pp. 17, 18) cites two cases: A soldier of the 7th chasseurs à cheval received, in December, 1814, a sabre wound across the anterior part of the right knee, extending from the internal to the external part of the knee and opening the joint. Simple dressings were applied. The limb was painful during the first eight days; tetanus appeared on the fifteenth day and death resulted. A soldier of the 18th line received a sabre wound on January 15, 1815. The cut was transversely across the upper part of the knee joint and opened the cavity of the joint about an inch. There was copious hæmorrhage. The edges were brought together and simple dressings applied. There was little pain during the first three days; but on the fourth there was some fever and gastric disturbance. Numerous abscesses appeared, which were incised. The patient recovered in 27 days. FOURNIER (JULES) (*Essai sur les plaies des articulations*, Paris, 1823, Thèse No. 150, pp. 11, 14): Bottari, 8th guards, received, November 6, 1822, a sabre puncture over the left patella and two others on the anterior and upper portion. Considerable swelling ensued and synovia escaped through the small wound. By November 15th the wound had cicatrized and the patient was able to walk; there was very little stiffness in the articulation. A young chasseur received, in 1815, a sabre wound of the external portion of the right knee. The wound was three inches long and penetrated the synovial capsule, from which there was considerable effusion. The wounded surfaces were brought together and the limb permanently extended. On the tenth day cicatrization was complete. MALLE (P.) (*Clin. Chir. de l'hôpital Mil. d'instruction de Strasbourg*, Paris, 1838, p. 622): V——, fusilier, 26th line; entered hospital at Strasbourg March 25, 1830, with a sabre wound of the right knee. The tendons of the extensor muscles of the leg were divided near the insertion at the upper border of the patella. The wound was about three inches long. Clots were removed by the finger, the wounded surfaces brought together, and immobility secured by splints. Inflammation and suppuration ensued and the patient suffered from nausea and insomnia, but his condition improved; he had recovered on June 12, 1830. CHENU (J. C.) (*Rapport, etc., pendant la Campagne d'Orient en* 1854, 1855, 1856, Paris, 1865, p. 410) tabulates 5 cases of recovery after sabre, bayonet, and lance wounds of the knee, but gives no details. GARDEN (A. M.) (*Conservative Surgery—Treatment of Sword Wound of the Knee*, in *The Lancet*, 1859, Vol. I, p. 631): On September 13, 1857, a woman received sword cuts of both knees; the left was only slightly injured; the right knee was opened and a portion of the head of the tibia severed; the muscles and ligaments attached to the patella were cut through, leaving the patella itself attached by a very small piece of integument. Limb placed in position; patella replaced; union with anchylosis in about four months. WILLIAMSON (GEORGE) (*Military Surgery*, London, 1863, p. 173): Private John Cunnell, West York Rifle Regiment, was stabbed in the left knee by a bayonet on February 5, 1858. The wound was small and deep and just beneath the level of the patella; the pus was excessive; delirium and great agony followed; knee became swollen; abscesses formed outside of the joint and were opened. Profuse purulent discharge continued. April 6th, amputation of thigh; patient recovered. The specimen is preserved in the Museum of the Army Medical Department, at Netley, and is numbered 3633. VOLKMANN (R.) (*Penetrirende Kniegelenkswunde, Zweimalige Gelenkpunction, Heilung ohne Ankylose*, in *Deutsche Klinik*, B. XIII, 1861, p. 411): A mason, on June 23, 1861, received a sabre wound of the left knee joint; escape of synovia, fever, and extensive burrowing of pus; incisions, ice; recovery.

[1] O'MEAGHER (WILLIAM), *Cases in Military Surgery—Bayonet Wound of Knee Joint—Synovitis*, in *Am. Med. Times*, 1862, Vol. IV, p. 7.

The instances in which the penetrations of the knee joint were caused by falls on nails or scissors or by knife stabs are:

CASE 509.—Private S. Galliway, Co. B, 32d Ohio, was injured March 18, 1863, at Lake Providence, by falling on a nail, which entered the right knee joint at the external and inferior border of the patella, and penetrated downward and inward about an inch. Surgeon J. T. Hodgen, U. S. V., reported the case, and that the man entered the City Hospital at St. Louis three weeks after the reception of the injury. He was transferred to the Veteran Reserve Corps July 15, 1863; he is not a pensioner.

CASE 510.—Musician B. Williams, Co. C, 1st New York, aged 17 years, is reported by Acting Assistant Surgeon P. B. Goddard as having been treated at the Master Street Hospital, Philadelphia, from August 12 to November 26, 1862, for "synovitis of the knee joint from puncture by a nail of a cracker box on which he fell." There is no record of his ever having applied for a pension.

CASE 511.—Private T. A. Jackson, Co. H, 1st Rhode Island Cavalry, aged 23 years, entered Satterlee Hospital, Philadelphia, May 7, 1863. Acting Assistant Surgeon W. W. Keen, jr., reported: "The case is one of punctured wound of the knee joint followed by partial anchylosis. The patient states that in December, 1862, he fell from his horse, and that a pair of scissors in his knapsack punctured the right knee joint and broke off; that the points were removed three days after the accident, being three inches deep, and that severe inflammation followed, and a large number of abscesses formed about the joint. When admitted the injured joint was smaller than the sound one, the hamstrings were contracted, and motion was limited from complete flexion to an angle of 135° with the thigh. On motion there was marked crepitation, the movement of the patella being much restricted. The cicatrix of the wound is located just to the inside and above the tubercle of the tibia, and all about the joint are old cicatrices from abscesses. The evidence of penetration of the joint is manifest, both by the position of the cicatrix as well as the escape of synovia, which took place according to the patient's statement. The patient walks about on crutches, and is unable to bear weight on the limb." He was discharged from service June 1, 1863. There is no record of his ever having applied for pension.

CASE 512.—Private E. Rice, Co. E, 100th Indiana, was discharged from service February 28, 1863, by reason of anchylosis of the right knee joint. Medical Inspector G. T. Allen, U. S. A., reported that the disability arose from a wound inflicted, September 16, 1862, by a pointed knife entering beneath the patella and penetrating the knee joint. The man is not a pensioner.

CASE 513.—Private D. R. Ewell, Co. G, 39th Massachusetts, received a knife wound of the left knee in April, 1864. He was successively admitted to the regimental, Harewood, and Portsmouth Grove hospitals, and returned to duty May 26, 1864. He is not a pensioner.

Incised Wounds of the Knee Joint.—The thirty-nine cases of this group were axe or hatchet wounds with the exception of perhaps one, in which the instrument with which the injury was inflicted is not named. Thirty-three cases were treated without operative interference and six were followed by amputations in the thigh.

Incised Wounds of the Knee Joint treated without Operative Interference.—Thirty-three cases, of which four proved fatal, are included in this category. In the majority of the cases the reports are brief, and the evidence regarding the penetration of the joint is very vague. A few cases of recovery are cited:

CASE 514.—Private N. Bacon, Co. C, 11th Michigan, aged 17 years, entered Cumberland Hospital, Nashville, May 17, 1864, with an incised wound of the left knee joint, caused accidentally by an axe two weeks previously. Surgeon B. Cloak, U. S. V., reported the case and that the patient was returned to duty June 4, 1864. The man is not a pensioner.

CASE 515.—Private J. H. Fuller, Co. K, 3d Massachusetts, age 28 years, received, October 20, 1862, an injury of the left knee joint by a hatchet, which penetrated outside of the patella and made quite a deep cut, causing much arterial hæmorrhage. The patient recovered, and was discharged April 1, 1863. He was pensioned on account of lameness and anchylosis of the joint. The case is reported by Surgeon Z. B. Adams, 32d Massachusetts.

CASE 516.—Private L. H. Hudson, Co. K, 1st Missouri Engineers, received an accidental blow from an axe in the left knee joint, at Waverly, June 3, 1864. The patella, half the capsular, and all the lateral ligaments were severed, allowing the synovia to escape from the joint. The patient passed through various hospitals, and was discharged January 11, 1865, and pensioned. Examining surgeons describe him as very badly disabled and suffering from looseness of the joint, the consequence of loss of parts of the outer side of the knee.

CASE 517.—Private W. Trahey, Co. H, 71st New York, was discharged from service May 31, 1862, by reason of lameness and partial anchylosis of the knee joint. Surgeon A. J. McKelway, 8th New Jersey, certified that the disability was caused by a wound made with an axe in February, 1862, which laid open the joint. The man is not a pensioner.

CASE 518.—Sergeant A. E. Waterman, Co. H, 1st Michigan Light Artillery, is reported by Acting Assistant Surgeon D. O. Farrand as having been admitted into St. Mary's Hospital, Detroit, August 20, 1864, with an "accidental incised wound of the right knee, penetrating the joint," and that he was returned to duty October 3, 1864. He is not a pensioner.

CASE 519.—Private J. Williams, Co. H, 2d Sharpshooters, aged 32, received an accidental wound of the right knee by an axe, April 3, 1864. Assistant Surgeon W. Webster, U. S. A., in charge of De Camp Hospital, reported that the joint was penetrated and that the patient was returned to duty May 27, 1864. He is not a pensioner.

The evidence in the remaining twenty-three cases[1] of recovery after incised wounds of the knee is of a similar nature. The fatal cases are:

CASE 520.—Private G. M. Sadler, Co. B, 22d Michigan, was admitted into hospital No. 3, Nashville, where he died February 8, 1864 Surgeon S. D. Turney, U. S. V., reported that the cause of death was "an accidental incised wound of the left knee joint, caused by an axe, and inflicted during the previous month.

CASE 521.—Sergeant J. A. Wynkoop, Co. E, 39th Iowa, aged 26 years, was accidentally wounded at Athens, Georgia, April 30, 1864. He was admitted into hospital No 19, Nashville, whence Surgeon W. H. Thorn, U. S. V., reported: "An axe wound of the left knee, penetrating the joint. Death on May 26, 1864."

CASE 522.—Private A. Hatfield, Co. I, 129th Illinois, aged 25 years, was admitted into the hospital of the 3d division, Twentieth Corps, October 7, 1864, with an accidental incised wound of the right knee, inflicted with an axe. On October 31st, he was transferred to hospital No. 1, Chattanooga, whence Surgeon J. H. Phillips, U. S. V., reports that he died on December 7, 1864, "of incised wound of right knee."

CASE 523.—Private A. G. Hill, Co. G, 43d New York, aged 25 years, was admitted into Finley Hospital, Washington, March 25, 1864, with an incised wound of the right knee, inflicted with an axe, accidentally, at Brandy Station, Virginia, February 19, 1864. Surgeon G. L. Pancoast, U. S. V., reports that he died May 21, 1864, from the effects of the wound.

Amputations in the Thigh after Incised Wounds of the Knee Joint.—Burrowing of pus, extensive sinuses above or below the knee, and sloughing, necessitated amputation in the thigh in six cases of incised wounds of the knee joint. Only one of the patients survived the operation:

CASE 524.—Private F. O'Brien, Co. A, 4th New York, aged 24 years, was cut in the left knee by an axe during a fight in a private house near Baltimore, February, 1862. He was admitted to hospital in Baltimore, where, on account of the diseased condition of the injured joint and adjacent parts, the limb was subsequently amputated about the middle of the thigh by Surgeon G. Taylor, U. S. A. The patient was discharged from service April 28, 1863, and supplied with an artificial limb. A cast of the stump was contributed to the Army Medical Museum by Assistant Surgeon J. W. S. Gouley, U. S. A., and constitutes specimen 919 of the Surgical Section. The man subsequently served in the Veteran Reserve Corps, and was discharged December 15, 1864. His application for pension was rejected.

CASE 525.—Corporal M. J. Allen, Co. I, 33d Indiana, aged 22 years, while putting up a tent on June 17, 1865, received an axe wound of the right knee joint. He was admitted to Brown Hospital, Louisville, several days afterwards, and on July 27th to Crittenden Hospital. Assistant Surgeon J. C. G. Happersett, U. S. A., in charge of the latter, reported that the injured knee was affected with synovitis; also that pus had penetrated the joint and was burrowing in the tissues above and below, necessitating amputation of the thigh, which was performed July 31st, by Acting Assistant Surgeon D. J. Griffiths, at the middle third. The patient died of diarrhœa August 11, 1865.

CASE 526.—Private H. C. Frazer, Co. A, 40th New York, while cutting wood, on June 20, 1862, accidentally struck the left knee. He entered Ascension Hospital, Washington, July 4th, whence Acting Assistant Surgeon J. W. Bulkley reported that the cut ran obliquely across the outside of the joint and had nearly healed when the patient was admitted. About ten or eleven days afterwards, however, the leg and joint became greatly swollen and inflamed, the skin rapidly assuming a bright red color. This was attended with excessive pain in the joint upon motion. Ice, cold irrigations, and tincture of iodine were applied, and salines, small doses of tartar emetic, and sweet spirits of nitre were administered. Bandages were applied from the foot to the knee joint with good effect. On July 26th, a small incision was made inside the ligamentum patella and gave exit to a large amount of sanious and highly offensive pus. About July 27th, the pus was noticed to be accumulating in the joint and burrowing above it in the muscles of the thigh. The bandage was still used, and cold, alternated with warm, applications were continued. Quinine and tincture of iron was now given, and beef tea and brandy punch freely. About the beginning of August an incision, made in the calf of the leg, gave exit to still more offensive pus. After August 5th the patient was slowly sinking. A small blackish discoloration was then seen on the inside of the leg, midway between the knee and the ankle; the foot, which from the first had remained œdematous, was puffed and pitting on pressure. On August 13th the black spot was noticed to be rapidly increasing and was recognized as gangrene, when a lotion of nitric acid was applied. On the following day, the necessity of amputation becoming manifest, two doses of one-half grain of morphia each were administered, after which the limb was removed about six inches below the trochanters by the antero-posterior flap method. The operation was performed by Surgeon J. C. Dorr, U. S. V., assisted by others, the patient being under the influence of chloroform, and losing but a slight amount of blood. Dead and disorganized tissues were found in the flaps and dissected out, after which the lips of the wound were closed by silver sutures and adhesive plaster. Stimulants were freely given, but the patient sank rapidly, and died at 5 P. M. on the same day. An examination showed that the soft parts were extensively disorganized nearly to the trochanters; also that the original wound had communicated with the knee joint.

CASE 527.—Private R. B. Swift, Co. H, 1st Regiment Michigan Engineers and Mechanics, aged 23 years, was accidentally cut in the right knee joint by an axe, while engaged on duty on the Northwestern Railroad in Tennessee, November 24, 1863.

[1] The cases are: 1. Pt. D. Bird, Co. G, 107th New York; 2. Pt. G. Blucher, Co. C, 119th New York; 3. C. Bradley, Government employé; 4. Pt. A. Capp, Co. H, 13th Illinois; 5. Pt. J. M. Condon, Co. B, 3d New York Cavalry; 6. Pt. H. Coon, Co. F, 143d New York; 7. Pt. T. Decker, Co. D, 15th New Jersey; 8. Pt. J. Elliott, Co. E, 4th California; 9. Pt. D. Geigheimer, Co. B, 131st New York; 10. Corp'l J. Howard, Co. D, 78th Illinois; 11. Pt. M. Kelley, Co. B, 59th Illinois; 12. Pt. J. Kimball, Co. A, 1st Wisconsin Cavalry; 13. Pt. L. B. Lewis, Co. C, 11th New Hampshire; 14. Pt. H. T. Marsh, Co. I. 8th Ohio; 15. Pt. J. Martin, Co. D, 159th New York; 16. Pt. R. M. Morris, Co. C, 84th Indiana; 17. Serg't J. L. Morse, Co. D, 21st N. York Cavalry; 18. Pt. G. W. Proctor, Co. D, 16th Illinois; 19. Pt. H. A. Smith, Co. G, 141st New York; 20. Pt. E. S. Spangler, Co. F, 145th Pennsylvania; 21. Pt. D. A. Stephens, Co. B, 2d Penn. Cavalry; 22. Pt. A. M. Sutton, Co. L, 4th New York Artilley; 23. Pt. J. Wood, Co. G, 79th Ohio.

On the following day he was admitted to hospital No. 3, Nashville, where the limb was amputated on January 5, 1864, by Surgeon S. D. Turney, U. S. V., at the lower end of the middle third of the thigh. The operation was performed by the circular method with little loss of blood, chloroform and ether being used and four ligatures applied. At the time of the operation the knee was greatly swollen and very painful, the internal condyle was laid bare by sloughing, and the joint had opened extensively, the discharges being very offensive. There were also extensive sinuses above the joint, and below it free incisions had been made to effect drainage. The patient had become quite reduced and was unable to sleep without opiates. He slept some during the night following the operation. Milk punch and beef tea were freely given, but the patient died from exhaustion January 7, 1864. The case was reported by the operator.

CASE 528.—Private R. H. Turner, Co. E, 1st Maryland, aged 23 years, was admitted to hospital at Frederick, October 3, 1864, having received an axe wound of the left knee joint. Acting Assistant Surgeon P. O. Cornish reported that the patient was not a very strong man and apprehensive of a fatal result from the first. Two and a half hours after the injury the wound was firmly closed with a stitch and adhesive plaster, after which cold lotions were used. Two days afterwards the joint became swollen and painful, and, on October 12th, synovia was flowing from the wound, the patient's tongue was coated, and his appetite poor. On October 15th, pus having formed in the joint, it was freely opened on both sides, also an abscess located above the knee but not communicating with the joint. Diarrhœa now set in and indications of pyæmia came on, and all the symptoms growing worse, amputation of the thigh at the middle third, by the circular method, was performed by Assistant Surgeon R. F. Weir, U. S. A., on October 18th. An examination of the amputated limb disclosed abscesses above and below the knee and in the popliteal space, and showed that the cartilages of the joint had commenced to break down. The treatment consisted of tonics, opiates, and stimulants. The stump having commenced to discharge unhealthy pus, it was opened on October 21st, and washed with bromine solution. Subsequently iodide of starch was administered, and iodine was applied to the stump. The patient died October 25, 1864. The *post-mortem* examination confirmed the existence of the pyæmic infection. The stump showed no reparative process around the bone, numerous small abscesses being present in the cellular tissues nearly to the hip joint. The fascia surrounding the femoral vein was closely adherent from inflammatory action, the coats of the vein being much thickened and filled with broken down clots. The valves of the vein and the coats of the femoral artery were also thickened and very friable. No pus was found in the hip joint.

In the next case the external wound had partly healed by first intention so that a probe could not be made to enter the joint, but insidious burrowing of pus and disorganization of the tissues finally rendered amputation unavoidable:

CASE 529.—Private O. F. Reams, Co. B, United States Engineers, aged 23 years, accidentally cut his right knee joint open with an axe while in the act of chopping down a tree in camp, on March 12, 1864. He was admitted to hospital in Alexandria, March 21st, at which time there was but little suppuration, the external wound having partly healed by first intention, so that a probe could not be made to enter the joint. The patient was doing very well and had a good appetite, and hopes were entertained that the joint might be saved. On April 12th, the limb was somewhat swollen and painful, and his appetite began to fail. On April 22d, fluctuation was distinctly detected, when an opening was made and two ounces of pus escaped On April 24th, the thigh was amputated in the upper third by lateral flaps, by Surgeon E. Bentley, U. S. V. The tissues below the point of amputation were found to be infiltrated with pus and badly disorganized. The patient reacted well, though not very promptly. Pyæmic chills began two days afterwards, and secondary hæmorrhage set in on April 28th, when the femoral artery was ligated just below Poupart's ligament. The patient died from the effects of pyæmia, May 1, 1864. At the autopsy large quantities of serous fluid were found in the pleural cavities and a number of pyæmic abscesses in the left lung. One abscess was also discovered in the spleen. The latter organ, together with the bones of the amputated knee, were contributed to the Museum, with the history, by the operator, and constitute specimens 2253 and 2234 of the Surgical Section.

SHOT INJURIES OF THE KNEE JOINT.—Of the three thousand three hundred and ninety-eight cases of shot wounds involving one or more bones of the knee joint, forty-three were designated on the reports as shot contusions, and three thousand three hundred and fifty-five as shot fractures.

SHOT CONTUSIONS OF THE KNEE JOINT.—Contusions of the knee joint[1] involving the condyles of the femur, the patella, or the head of the tibia by small projectiles or fragments of shell, were noted in forty-three instances. Thirty-three were treated without operative interference, and ten were followed by amputation.

[1] Examples of shot contusions of the knee joint are reported by JOBERT DE LAMBALLE (*Plaies d'armes à feu*, Paris, 1833, p. 265), who cites two successful cases. CHENU (J. C.) (*Rapport, etc., pendant la Campagne d'Orient*, Paris, 1865, p. 410) tabulates 70 cases of shot contusions of the knee joint, of which 4 proved fatal. CHENU (J. C.) (*Stat. Méd. Chir. de la Campagne d'Italie en* 1859 *et* 1860, Paris, 1869, T. II, p. 766) records 21 cases of shot contusions of the knee joint; 17 patients recovered and 4 died. HEINE (C.) (*Die Schussverletzungen der Unteren Extremitäten*. Berlin, 1866, p. 57) cites a case in which a bullet struck the lower third of the thigh on the inside just above the knee, passed over the knee, hugging the bone closely, and escaped on the outer side of the knee. On the third day after the injury a viscid fluid escaped from the wound of entrance. During the first days the symptoms were slight, and the wounds looked well, but they soon assumed an angry appearance. Immense infiltration and pyæmia supervened, and death occurred 14 days after the injury. At the *post-mortem* examination the bone was found entirely intact; no roughening was noticeable, the periosteum only being partially destroyed where the ball had passed along the bone. . . The synovial sac was opened at its inner and upper circumference and was filled with pus. STROMEYER (L.) (*Erfahrungen über Schusswunden im Jahre* 1866, Hannover, 1867, p. 55) tabulates 8 shot contusions of the knee joint, but gives no results. RUPPRECHT (L.) (*Militärärztliche Erfahrungen während des Deutsch-Französischen Krieges im Jahre* 1870–71, Würzburg, 1871, p. 10) tabulates 8 cases of shot contusions of the knee joint and patella but does not indicate the results in the cases.

Shot Contusions of the Knee Joint treated by Conservation.—Of the thirty-three cases of this group, eleven, or 33.3 per cent., were fatal. More or less swelling, extensive inflammation often involving the synovial membranes, necrosis, and exfoliations of small pieces of bone, abscesses, and effusions into the joint were the most prominent symptoms following shot contusions of the bones of the joint, and the cases of recovery were followed by wasting of the limb, partial or complete anchylosis, and, in a few instances, by permanent enlargement of the joint and exacerbations of pain and swelling during damp seasons.

Recoveries after Shot Contusions of the Knee Joint treated by Conservation.—Twenty-two cases of this group are reported. The patella was the seat of the contusion in nine, the condyles of the femur in seven, the patella and condyles of the femur in two, and the head of the tibia in one instance; in three cases the parts injured are not specified. Four were Confederate and eighteen were Union soldiers. Of the latter, one was returned to duty and afterwards killed in battle; fifteen became pensioners, of whom one died of phthisis four years after the injury; two have not applied for pensions.

CASE 530.—Private C. Bowers, Co. D, 84th Pennsylvania, aged 23 years, was wounded in the left knee, at Winchester, March 23, 1862, a ball striking the patella, passing upward one and a half inches, and lodging. He was admitted to St. Joseph's Hospital, Philadelphia, April 2d, where the missile was extracted by an incision. Considerable pain and inflammation ensued, and an abscess formed above the wound, discharging itself through the opening made for the removal of the ball. The patient was discharged July 16, 1862, and pensioned. Examining surgeons report him suffering from weakness in walking.

CASE 531.—Private G. W. Clark, Co. G, 126th Ohio, aged 27 years, was wounded at Winchester, September 19, 1864, by a musket ball, which passed through the right knee, grazing the patella. He was treated at various hospitals, and was ultimately mustered out June 25, 1865, and pensioned. Examining surgeons report partial anchylosis of the knee, difficulty in walking up and down hill, and considerable wasting of the limb.

CASE 532.—Private *G. Deacon*, Co. G, 14th Virginia Cavalry, aged 25 years, was wounded at Boonsboro', July 8, 1863, by a spent ball, which entered the outer and lateral surface of the right knee, passed inward and forward, striking the patella and lodging. He entered Frederick Hospital one week afterwards. The patient stated that he worked the ball out with his fingers on the field. About July 25th, an abscess formed at the point where the ball had lodged, when the external opening was enlarged, allowing the escape of about half an ounce of pus. Though no synovial fluid escaped, marked evidence of the joint being involved existed, the swelling being more extensive on the following day and fluctuation well marked. Tincture of iodine was then freely applied and the limb was placed in Smith's anterior splint. By August 10th the wound was nearly closed, the effusion within the joint had almost entirely subsided, and the patient was comfortable. On August 20th the wound was entirely healed, the appearance of the joint being natural, though considerable anchylosis existed, partly perhaps from deposit and partly owing to long continuance in one position. About a week later the splint was removed, and, on September 1st, passive motion was exercised without producing much pain or tenderness. On September 5th, the patient was transferred to Baltimore, having considerable and daily increasing motion of the knee. The man was paroled for exchange September 25, 1863.

CASE 533.—Private J. Hammond, Co. B, 98th Ohio, aged 25 years, was wounded in the left knee by a musket ball, at Chickamauga, September 20, 1863. He was admitted to hospital at Chattanooga, whence Surgeon J. T. Woods, 99th Ohio, reported: "The missile entered at the inner hamstring precisely opposite the centre of the patella, and emerged an inch from the inner border of the patella." The patient was transferred to hospital No. 1, Nashville, where he was discharged from service March 3, 1864, by reason of "chronic synovitis and anchylosis of the knee joint." His name was subsequently admitted on the Pension Rolls, examining surgeons certifying to his disabilities, and reporting some enlargement of the bone and also swelling of the leg.

CASE 534.—Sergeant J. Hendricks, Co. F, 105th Pennsylvania, aged 32 years, was wounded in the right knee, at Gettysburg, July 2, 1863. He was admitted to hospital at Annapolis two weeks after the injury, and several months later he was transferred to Philadelphia. Surgeon I. I. Hayes, U. S. V., in charge of Satterlee Hospital, reported that the wound was caused by "a rifle ball striking the inner portion of the patella and involving the knee joint. The patient recovered with an anchylosed joint. He was assigned to the Veteran Reserve Corps December 11, 1863." On September 16, 1865, the man was discharged from service, and subsequently he became a pensioner. In 1878, the examining surgeons reported: "The power to extend and flex the injured knee is still slightly impaired."

CASE 535.—Private G. Hodges, Co. B, 7th Michigan, aged 25 years, was wounded at Gettysburg, July 2, 1863, and entered Satterlee Hospital, Philadelphia, one week afterwards. Acting Assistant Surgeon M. J. Grier noted: "A shot wound of left knee by a minié ball passing over the patella, cutting through the outer laminæ of the ligamentum patella and scratching the surface of the bone." A portion of the patella became necrosed during the progress of the case. The wound closed about October 1st, but reopened some ten days later, when a small piece of bone exfoliated. The wound healed about November 1st. Some days afterwards, however, the patient, while wrestling, fell on his injured knee, breaking open the tissues down to the tendon over the patella for an inch and a half in length. After this rupture reclosed the patient had an attack of facial erysipelas, which was cured, and subsequently he suffered with otorrhœa. On March 24, 1864, the patient was returned to his regiment for duty. He was killed at the battle of the Wilderness, May 6, 1864.

CASE 536.—Corporal L. P. Miller, Co. G, 124th New York, aged 27 years, was wounded at Chancellorsville, May 3, 1863, by a minié ball, which entered the left knee one-half inch external to the inner condyle of the femur and emerged two inches anteriorly, bruising the bone. Surgeon D. W. Bliss, U. S. V., reported his admission to Armory Square Hospital, Washington, May 8th, with the knee joint in a swollen condition. Irrigation was made by water dressings, and subsequently tincture of iodine was applied to the knee. By June 6th the wound had nearly healed, but there was considerable effusion in the joint and contraction of the flexor tendons. The patient subsequently passed through several hospitals, was assigned to the Veteran Reserve Corps March 2, 1864, and ultimately discharged August 13, 1865, and pensioned. Examining surgeons report swelling of the knee, owing partly to enlargement of bone and partly to œdematous condition of the tissues; also anchylosis from injury of the bony structures and from contraction of the tendons and ligaments.

CASE 537.—Private M. Piggott, Co. K, 88th New York, aged 19 years, was wounded at Savage Station, June 29, 1862, by a minié ball, which grazed the right knee joint between the patella and the inner condyle of the femur. He was captured and remained a prisoner for nearly a month, when he was exchanged and conveyed to Philadelphia. Acting Assistant Surgeon J. B. Bowen reported that the patient was admitted to Fourth and George Streets Hospital, suffering from synovitis and a very painful wound as well as a much swollen knee. The treatment consisted of cold-water dressings, and afterwards fly blister and solution of lead and opium was used. On August 24th, the adhesions were broken up by Acting Assistant Surgeon S. D. Gross, and splints were applied. This was followed by more severe painfulness and enlargement of the knee. The patient was discharged from service and pensioned February 10, 1863, Assistant Surgeon L. D. Harlow, U. S. V., certifying to the "wound causing an external communication with the knee joint and resulting in permanent anchylosis. Surgeon E. P. Vollum, U. S. A., reported that the pensioner subsequently served in the 43d Infantry (Invalid Regiment), his injured knee being free of pain, but perfectly anchylosed and considerably bent inward, and flexed so that the heel did not reach the ground by about four inches. On May 10, 1869, the man was again discharged and re-admitted on the Pension Rolls.

CASE 538.—Brigadier General T. G. Pitcher, U. S. V., was wounded at Cedar Mountain, August 9, 1862, by a musket ball, which entered the right knee at the internal condyle of the femur, striking the bone perpendicularly upon its anterior face. The result of the injury, as apparent nine months after its reception, was recorded by Surgeon R. S Satterlee, U. S. A., before whom the patient appeared for examination in April, 1863, as follows: "There is an unusual accumulation of fluid in the joint, enlargement of and more or less painfulness generally of the knee, and inability to extend the leg completely. The knee is subject to pain and swelling during cloudy weather, and the General is, at all times, required to use a crutch and cane. It would be exceedingly imprudent for him to travel. It is not known whether the missile remains in the knee or came out." General Pitcher was mustered out of the Volunteer service April 30, 1865, returned to the Regular Army, and was ultimately retired June 28, 1878.

CASE 539.—Adjutant *J. R. Youre*, Caswell's Georgia Sharpshooters, was wounded at Liberty Gap, June 25, 1863, and admitted to hospital at Murfreesboro' the following day. Assistant Surgeon W. P. McCullough, 78th Pennsylvania, in charge, recorded the following history: "A gunshot wound of left knee by a minié ball. The missile struck the outer condyle of the femur, glancing downward and opening the capsular ligament of the joint, and making its exit at the middle of the fibula. The wound looked healthy and there was no inflammation. Ice was applied to the knee. One-half ounce of whiskey was given three times a day, and anodynes at bedtime. On July 27, 1863, the patient was sent to the prison at Nashville, his wound being entirely well, and there being but partial anchylosis of the joint."[1]

Fatal Cases of Shot Contusions of the Knee Joint treated by Conservation.—Ten cases of shot contusions of the knee joint terminated fatally. The patients survived the injury from twenty to seventy days, experiencing extensive burrowing of pus and ulceration of the joint, erysipelatous swelling, arterial bleeding, and, in one instance, gangrene. A few cases are detailed:

CASE 540.—Private G. W. Perkins, Co. G, 1st Massachusetts Cavalry, aged 22, was wounded at Beverly Ford, June 9, 1863, by a pistol ball, which entered the left knee at the lower outer edge of the patella, passed downward, and came out over the head of the fibula. Three days after the reception of the injury he was admitted to Douglas Hospital, Washington, where he was etherized and an incision made to examine the wound, when the head of the tibia was found to be grazed and the joint opened, allowing synovia to escape on motion of the limb. Ice-water dressings were applied for a couple of days. It was then resolved by Assistant Surgeon W. Thomson, U. S. A., in charge of the hospital, to lay the knee joint freely open by means of liberal incisions on either side of the patella and through the original track of the wound. By this means it was hoped to give free exit to pus, which was already filling the joint, and to save the limb with anchylosis, the operation being adopted as the only alternative to amputating the thigh. A large quantity of bloody pus and synovia escaped when the lateral incisions were made; two or three cutaneous vessels were tied, and by means of a syphon the limb was kept constantly under the effect of ice water. The patient, though having some fever and retention of urine, had very little pain in the knee and felt comfortable. Morphia and sweet spirits of nitre were prescribed. On June 17th, there was some fluctuation along the base of the internal condyle, for which a free horizontal incision was made, and flaxseed poultices were applied. All the incisions about the knee continued to discharge freely. About one week later an erysipelatous swelling was noticed, a deep-seated abscess having apparently formed and fluctuation being detected below the head of the tibia. A large quantity of pus was then liberated by a careful dissection, and the painful tension of the leg was thereby relieved. On June 26th, the patient had a severe chill for the first time, and his stimulants were at once increased and quinine and capsicum added to the prescription of morphia. On the following day the fever had disappeared, but pneumonic symptoms were detected, and a mustard plaster was applied over the left chest.

[1] This case has been noted by Surgeon I. MOSES (*Surgical Notes of Cases of Gunshot Injuries, etc.*, in the *American Journal of Medical Sciences*, 1864, Vol. XLVII, p. 340).

Suppuration still continued freely from all the openings. On the morning of July 1st, a large amount of arterial blood was found to have escaped through the incision along the gastrocnemius muscle, and compression was at once made in the groin and the wound was cleaned out carefully, the source of the bleeding being apparently the anterior or posterior tibial artery near the bifurcation, and too deeply seated to be reached without careful dissection. Meanwhile the patient, already moribund, was stimulated, but without avail. He died within a half hour, from the immediate effects of the hæmorrhage. At the autopsy a diffused abscess was found following the course of the vessels in the popliteal space into Hunter's canal but not otherwise involving the thigh; all the connecting tissue in the ham was in a sloughing condition. When the artery was dissected out the perforation was found in the anterior tibial, about three-fourths of an inch from its origin, the vessel being much thickened, soft, and tough, though not materially diseased. The left lung was found firmly adherent and much congested. The bones comprising the injured knee joint were contributed by Dr. Thomson (*Cat. Surg. Sect.*, 1866, p. 323, *Spec.* 1339), and the history of the case was furnished by Assistant Surgeon C. C. Lee, U. S. A.

CASE 541.—Private J. McAllister, Co. C, 72d Pennsylvania, was wounded in the right knee, at the Wilderness, May 6, 1864, by a minié ball, which entered four inches above the external condyle and lodged on the outside of the patella, without perforating the capsular ligament. Surgeon D. Prince, U. S. V., reports that the following treatment was resorted to in the case: "The bone was cut down upon and the missile pulled out. No inflammation of the joint ensued until the eleventh day after the injury, when the joint swelled and became excruciatingly painful, attended with free discharge of synovia from the wound in front, on the outer side of the patella. On May 18th, this opening was enlarged and a counter-opening was made behind the external lateral ligament and tendon of the biceps, the patient being under the influence of ether. The limb was subjected to moderate extension for the following purposes: 1st, to separate the opposing joint surfaces and obviate the ulceration attending contact and pressure, at the same time lessening the amount of irritation; 2d, to obviate the caries and necrosis of bone apt to follow, and making bony anchylosis impossible; 3d, to preserve the limb in a position to be afterwards useful. The patient was relieved of suffering by the incision and experienced a feeling of comfort from the moderate extension." The records in this case show that the patient was admitted to the field hospital of the 2d division, Second Corps, with "shot wound of knee," and Surgeon T. R. Crosby, U. S. V., reported that the man entered Columbian Hospital, Washington, May 28th, with "shot wound of right knee joint," of which he died on the following day, May 29, 1864.

CASE 542.—Private A. D. Seelye, Co. A, 136th Pennsylvania, was wounded at Fredericksburg, December 13, 1862, by a musket ball, which entered the right knee over the external condyle of the femur and passed out in the popliteal space. He was admitted to Lincoln Hospital, Washington, ten days after the injury. Cold-water dressings and afterwards iodine tincture were applied at first; subsequently warm dressings. The wound did badly; the joint became inflamed, and unhealthy pus was secreted in large amounts. On January 16, 1863, an incision was made extending six inches from the wound of entrance up the thigh. Considerable bleeding followed and several small vessels were tied, after which the wound was packed with cotton bandages soaked in persulphate of iron. Another lateral incision, two and a half inches long, was made below the popliteal, opening an abscess. On January 25th, an opening was made opposite the large one for the purpose of better drainage. Up to this time his appetite had been good, but now it failed, and the patient became delirious and had a troublesome diarrhœa. The wound remained open and exposed the blackened surface of the femur for the space of three inches. Death supervened on February 3, 1863. At the *post-mortem* examination the internal condyle was found to be injured in its posterior aspect. The cartilages of the joint were destroyed and the surfaces of most of the bones roughened and honey-combed. An abscess in the thigh had dissected the femur half way up the limb. The history of the case was recorded by Acting Assistant Surgeon T. H. Dearing.

CASE 543.—Private J. Tetlow, Co. F, 23d New Jersey, was wounded at Fredericksburg, December 13, 1862, by a ball entering the outer side of the popliteal space of the right leg. The patient, a strong healthy man, was admitted to hospital at Alexandria six days after receiving his wound. The knee was tender and the inflammation slight at first, but soon grew worse. On December 23d, the patient had a chill and there was high constitutional fever, with great swelling and pain in the knee. On the following day the ball was discovered lying loose in the wound and was removed. On December 29th, pus was detected and let out by free incision, giving much relief. Subsequently the patient became delirious at times, and on December 31st he again had a chill, with pain in the stomach. He died January 2, 1863. At the autopsy it was ascertained that the ball had impinged upon the under side of the internal condyle, killing the periosteum for over a space of half a dime. The other articulating bones were also found bare of periosteum, and pus had filled the knee joint and dissected up the lower third of the femur. The case was reported by Acting Assistant Surgeon G. F. French.[1]

CASE 544.—Private L. D. Wells, Co. D, 74th Indiana, aged 22 years, was wounded at Chickamauga, September 20, 1863, by a musket ball, which entered about two inches above the inner condyle of the right femur, passed obliquely under the bone between the two condyles, grazing the inner, and emerged about three inches below the head of the fibula. He was admitted to hospital at Chattanooga, and thence transferred to hospital No. 8, Nashville, on October 30th. There was little swelling of the parts, and the relative constitutional condition of the patient was good until he became greatly prostrated from hæmorrhage, the precise seat of which could not be determined. On November 17th, the femoral artery was ligated at Scarpa's space by Surgeon W. C. Otterson, U. S. V. Reaction was perfect by the following day. The limb was wrapped in cotton batting. No particular change occurred until November 24th, when the wound suppurated excessively and injections of solution of sulphate of iron were ordered. The leg and foot were œdematous. On the next day the wound made by the operation broke open and suppurated freely. On November 27th, the patient was worse in every respect and marks of gangrene appeared. Remittent hæmorrhage from the anterior tibial artery caused death on December 1, 1863. The autopsy showed that the ligature had not yet cut away. The femoral was obliterated on the cardiac side for about one inch; the profunda was greatly enlarged. The femoral vein was discolored and contained a clot three or four inches long and not entirely obstructing the circulation. The structures at the seat of the hæmorrhage were greatly disintegrated. The history of the case was reported by the operator.

[1] BELLANGER (J. B.), *Report of Five Cases of Gunshot Injury of the Knee Joint treated at Mansion House Hospital, Alexandria, Virginia, May 16, 1863*, in *American Journal Medical Sciences*, 1863, Vol. XLVI, p. 44.

CASE 545.—Private C. Werth, Co. K, 1st New York, aged 22 years, was wounded in the left knee and right ankle, near Richmond, June 30, 1862. Acting Assistant Surgeon J. B. Bowen reported: "A ball entered one inch above the knee, and emerged at the inner portion of the leg one inch below the patella, grazing that bone and the head of the tibia; the other ball entered at the external malleolus and comminuted the tarsal bones. The wounded man was taken prisoner and sent to Richmond. He was received at the Fourth and George Streets Hospital, Philadelphia, July 25th, in a debilitated state and with both wounds in a very bad and painful condition, there being synovitis of the knee and purulent discharges. Linseed poultices and solution of sulphate of copper were applied to the ankle, and cold-water dressing and subsequently blister, followed by solution of lead and opium, were used to the knee. The patient gradually sank, and died from exhaustion August 8, 1862."

Amputations after Shot Contusions of the Knee Joint.—The ten instances comprising this group have already been cited in the tables of amputations in the thigh in the preceding section of this Chapter. Five were intermediary and five secondary operations.[1] Eight of the ten operations terminated fatally.

SHOT FRACTURES OF THE KNEE JOINT.—The cases to be considered in this group are those involving primarily the bones composing the knee joint. They number three thousand three hundred and fifty-five, and are classified in the subjoined table:

TABLE LII.

Numerical Statement of Thirty-three Hundred and Fifty-five Cases of Shot Fractures of the Bones of the Knee Joint.

PARTS INJURED.	MODE OF TREATMENT.																				
	CONSERVATION.					EXCISION OF KNEE JOINT.				EXCIS. OF KNEE J'T FOLLOWED BY AMPUTAT'N OF THIGH.			AMPUTATION AT KNEE JOINT.				AMP. AT KNEE J'T FOLLOWED BY AMPUTAT'N OF THIGH.			AMPUTATION OF THIGH.

It will be seen that the table embraces a great variety of injuries. In two hundred and eighty-three instances the bony lesion interested the patella only; in five hundred and ninety-four the condyles of the femur were fractured; in eighty-nine the condyles of the femur and the patella; in eighty-six the condyles of the femur and the head of the tibia; in twenty-seven the condyles of the femur, the patella, and the head of the tibia; in thirty-three the patella and the head of the tibia; in four hundred and forty the head of

[1] The cases of intermediary operations are: Pt. J. Kimm, E, 152d New York, recovery (No. 99, TABLE XXXV, p. 281); Pt. C. Berkey, A, 10th Pennsylvania Reserves, fatal (No. 221, TABLE XXXV, p. 283); Serg't J. Walker, F, 2d Maryland, fatal (No. 453, TABLE XXXV, p. 286); Serg't M. Akeman, I, 13th Indiana, fatal (No. 220, TABLE XXXVI, p. 296); Pt. J. Wright, D, 7th New York Heavy Artillery, fatal (No. 676, TABLE XXXVI, p. 303). The secondary operations are: Pt. *I. Bradley*, D, 25th North Carolina (No. 32, TABLE XXXVIII, p. 308); Pt. J. Jones, K, 13th Tennessee Cavalry, recovery (No. 46, TABLE XXXIX, p. 314); Corp'l *R. H. McCann*, G, 13th Mississippi, fatal (No. 141, TABLE XXXIX, p. 315); Pt. T. Nevins, F, 63d New York, fatal (No. 172, TABLE XL, p. 322); Corp'l J. D. Touhey, B, 14th New York, fatal (No. 196, TABLE XL, p. 323).

the tibia was involved; and in one thousand eight hundred and three the fractured portion of the articulation was not specified. Eight hundred and sixty-eight were treated on the expectant conservative plan; forty-nine by excision; seven by excision and subsequent amputation of the thigh; forty-nine by amputation through the articulation; five by amputation at the knee joint and subsequent amputation of the thigh; two thousand three hundred and seventy-seven[1] by amputation of the thigh, six of which were followed by amputation at the hip.[2]

SHOT FRACTURES OF THE BONES OF THE KNEE JOINT TREATED BY CONSERVATION.—Of the three thousand three hundred and fifty-five cases of shot fractures of the bones of the knee joint, eight hundred and sixty-eight, or about one-fourth, were treated throughout without operative interference.[3] The results in nine instances

---

[1] There are noted in this table 2,389 amputations of the thigh for shot fractures of the bones of the knee joint, of which 12 had been preceded by excisions or amputations at the knee joint, and 6 had been followed by disarticulation at the hip. To these 2,389 amputations should be added 10 operations for shot contusions of the knee joint, making the total of 2,399 cases of thigh amputations for shot injuries of the knee joint, as indicated in TABLE XLVI, on page 332, *ante*.

[2] Cases of Pt. Julius Fabry, Co. K, 4th Artillery (CASE 330, p. 153, and No. 2 of TABLE XVII, p. 159); Pt. Eben E. Smith, Co. A, 11th Maine (CASE 332, p. 155, and No. 4 of TABLE XVII, p. 159); Serg't E. D. Ulmer, Co. G, 15th New Jersey (CASE 333, p. 156, and No. 5 of TABLE XVII, p. 159); Pt. *R. A. Vick*, Co. E, 43d North Carolina (CASE 334, p. 157, and No. 6 of TABLE XVII, p. 159); Henry Campbell, sutler's clerk (CASE 335, p. 157, and No. 7 of TABLE XVII, p. 159), and Pt. Lewis Larry, Co. A, 1st New Orleans Regiment (CASE 336, p. 158, and No. 9 of TABLE XVII, p. 159).

[3] Examples of shot wounds of the knee joint treated without operative interference have been cited by FRAMBESARIUS (N. A.) (*Canonum et Consultationum*, Libri III, *quibus aphoristica methodus medendi omnibus affectibus corporis continetur*, Paris, 1565): A ball lodged in the knee joint appeared afterwards on the surface and was cut out. SCHMIDT (J.) (*Speculum Chirurgicum oder Spiegel der Artzney*, Augspurg, 1656, pp. 153 *et seq.*): On December 12, 1632, a Swedish dragoon was shot through both knees; both patellas were fractured; the patient recovered, but could walk only poorly on crutches. In October, 1647, a Bavarian soldier was shot through the right knee; he remained for three days without assistance; a "jury of six" recommended amputation; Dr. SCHMIDT refused to operate, dressed the wounds, and placed the limb in a straight position; pieces of bone came away; recovery in six weeks. G. Basch, shot through the left knee joint, May 18, 1648; fracture of bones; recovery. Th. Rosen, shot through right knee; recovery. Z. Neschin, shot through right knee, May 20, 1648; swelling; suppuration relieved by incision; recovery. GUILLEMEAU (J.) (*Les Oeuvres de Chirurgie*, Rouen, 1649, Chap. IV, p. 652): M. de la Tour received, in the barricades of Paris, a shot wound of the left knee joint; ball entered above the crest of the tibia, fractured "*le petit fossile*" in several pieces. Barber-surgeon Habicot made an incision and removed the spiculæ; recovery. WISEMAN (R.) (*Severall Chirurgicall Treatises*, London, 1676, p. 430): A page of Lieut. General D. L—— was shot through the knee, the ball fracturing the joint; excessive pain and aneurismal bleeding; putrefaction, delirium, spasms, death. BELLOSTE (*Le Chirurgien d'Hôpital*, Paris, 1710, p. 216): A captain, shot through the right knee, at Pignerol, in 1691; extensive suppuration; wound of entrance enlarged by incision; recovery in five months. MORAND (*Opuscules de Chirurgie*, Paris, 1768, T. II, p. 252): General Keith, shot at the siege of Okzakow, in 1738, through the right knee; extensive suppuration followed; two pieces of cloth escaped; the General recovered and was afterwards killed at the battle of Chemnitz. DESPORT (*Traité des plaies d'armes à feu*, Paris, 1749, p. 222 *et seq.*): A cannonier, at the siege of Milan, in 1733, received a shot wound of the knee joint, fracturing the inferior extremity of the femur; wound enlarged and the ball, found embedded in the femur, removed. The patient recovered in two months.—A soldier, shot in the right knee, at the battle of Parma, in 1733; the ball lodged in the joint. The external condyle of the femur was fractured; the ball was extracted, and the patient recovered with complete anchylosis. A volunteer was shot, in Corsica, in the outer and anterior part of the knee. The wound was enlarged and fragments of the outer condyle of the femur and of the patella were removed, and the ball extracted; the patient recovered in two and a half months. THEDEN (J. C. A.) (*Neue Bemerkungen und Erfahrungen zur Bereicherung der Wundarzneykunst*, Berlin, 1782, B, I, p. 78): Major Kamke, wounded at Striegau, in 1745; the ball perforated both condyles of the femur; the wound was enlarged and a large number of spiculæ removed from the extremity of the femur; recovered with a stiff knee joint. BOUCHER (*Observations sur des playes d'armes à feu, etc.*, in *Mém. de l'Acad. Roy. de Chir.*, Paris, 1753, T. II, p. 295): A drummer, wounded May 2, 1749, at Lille, through the internal condyle of the femur; wound enlarged and fragments removed; recovery, with stiff knee and one and a half inch shortening. BELMAS (BORDENAVE) (*Précis de plusieurs observations sur les playes d'armes à feu, etc.*, in *Mém. de l'Acad. Roy. de Chir.*, Paris, 1753, T. II, p. 527): A captain of an Algerian vessel was shot through the knee, the ball carrying away about three inches of the upper part of the tibia, a small portion of the patella, the head of the fibula, and a portion of the condyle of the femur. Dr. BELMAS removed several fragments, and the patient recovered with anchylosis of the knee joint. Two similar cases are detailed by MEIHÉE (J.) (*Traité des plaies d'armes à feu*, Paris, An. VIII (1800), p. 175): A cavalier, wounded at Ludzerberck; the ball passed through the right knee from before backwards, shattering the patella and the condyles of the femur; extensive incisions were made and numerous pieces of bones, some loose, some partly attached, were removed; recovery, with complete anchylosis. A laborer of Meaux was shot through the right knee from the outer to the inner side, shivering the articulation; swelling of the thigh and gangrene; large incision to allow the escape of fetid pus; a piece of bone the size of a dollar, and of the thickness of the little finger, from the condyles of the femur, was removed, and other sharp points of bone were cut off; 15 days later another piece of bone, an inch long, from the loose portion of the shaft of the femur, was removed; recovery, with hardly any defect of the articulation. HUNTER (JOHN) (*A Treatise on the Blood, Inflammation, and Gunshot Wounds*, London, 4to, 1794, p. 531): A French soldier at Bellisle, in 1761, shot through the knee, the ball traversing the joint without fracture of bones; recovery. L. J. RABASSE (*Sur les plaies des articulations faites par les armes à feu ou les instrumens tranchans*, Thèse à Paris, 1811, No. 84, pp. 10, 18): General Charles de Lameth, wounded at the siege of New York 1783,[?] the ball traversing the left knee through the condyles in its greatest diameter from the right to the left. The patient, who was treated by Surgeon-Major ROBILLARD, of the French army in the United States, recovered without the least immobility of the limb. In a second case the condyles of the femur were fractured, and the ball lodged. The missile could not be found. Extensive swelling followed, but the patient recovered in about three months, with anchylosis of the knee. The author regrets that the man's pantaloons were not examined, as the ball might have been found. DESAULT (*Journal de Chirurgie*, Paris, 1791, T. I, p. 321): V. Viry, aged 15 shot in the right knee on January 6, 1790; fracture of the patella and the condyles of the femur; recovery without anchylosis. GERMAIN LEVIELS (*Essai sur les avantages qu'il peut y avoir à amputer la cuisse, lorsqu'un coup de feu a traversé l'articulation du genou, ou lorsque la balle y est demeurée profondément engagée*, Paris, Thèse, Vol. XXXII, An XI–1803, p. 40 *et seq.*) cites six fatal cases: J. Bourdon, wounded in Italy, November 22, 1793; shot wound of knee joint; bones not fractured; fatal. Young man, aged 20; shot through knee joint in June, 1797; bones crushed; amputation refused; fatal. Two soldiers shot in the knee joint in October, 1793. The patella and the condyles of the femur were fractured in one case; the ball lodged; erysipelatous swelling; death. In the other case the ball passed through the joint, perforating the condyles of the femur; several spiculæ were removed; suppurative fever and death. Captain Milet, 72d Grenadiers, shot through the knee joint June 27, 1798; no bony lesion; suppuration relieved by incision; fever; death. Barot, 72d Grenadiers, shot in the right knee on October 2, 1799; extreme pain, swelling, inflammation, and death. PERCY (*Manuel du Chirurgien-D'Armée*, Paris, 1792, p. 164) alludes to the case of M. d'Almons, an engineer;

could not be ascertained. Three hundred and thirty-eight were successful, and five hundred and twenty-one fatal, a mortality of 60.6 per cent.

Recoveries after Shot Fractures of the Bones of the Knee Joint treated by Conservation.—Examples of the three hundred and thirty-eight recoveries after shot injuries of the bones of the knee joint treated throughout on the expectant plan, will be cited in the order of the groups indicated in TABLE LII. In the following five cases the joint was opened and the condyles of the femur injured:

CASE 546.—Captain A. P. Fisk, Assistant Adjutant General, U. S. V., was wounded at Fair Oaks, June 1, 1862, by a conoidal musket ball, which entered the inner side of the right knee and was cut out from beneath the skin on the outer aspect. The hæmorrhage following the injury was slight. The case was reported by Surgeon G. Grant, U. S. V., who, together with Surgeons J. A. Lidell and A. N. Dougherty, was satisfied that the joint was implicated. Immediate amputation was advised but rejected by the patient. The pain in the joint was excruciating. Surgeon Grant dressed the wound, after which the patient

the ball encrusted itself in the condyle of the femur, and the patient recovered. WEDEKIND (GEORGE) (*Nachrichten ueber das Französische Kriegs-spitalwesen*, Leipzig, 1798, B. II, p. 205): J. H. Barzon, Corporal, 10th demi-brigade of Light Infantry; shot comminution of right knee, in 1795, near Rastadt; tetanus; death. CHEVALIER (T.) (*A Treatise on Gunshot Wounds*, 1804, p. 116): J. T——, aged 19, August 27, 1799, external condyle of femur split; October 1st, a piece of bone removed; 10th, amputation proposed but abandoned as the patient fainted on moving; death in a few days. At the *post-mortem* the ball was found in the internal condyle of the femur. LARREY (D. J.) (*Mém. de Chir. Mil. et Camp.*, Paris, 1812, T. III, p. 256): Ibrahim, a mameluke, received, in August, 1799, a shot fracture of the patella; the ball traversed the knee joint; the patient recovered. FENECH (E.) (*Obs. recueillies à l'armée d'Espagne sur les plaies d'armes à feu aux extremites*, Paris Thesis, 1813, pp. 13, 19): Obs. XIII, soldier of 62d regiment, wounded at Vimeira, in Spain, August 17, 1808; fracture of inner condyle of femur; recovery. Obs. XXVII, Gracieux, Adjutant, 62d regiment, wounded August 17, 1808; fracture of patella and inner condyle of femur; fatal. MÉALONIER (*Sur les plaies de l'articulation du genou faites par les armes à feu*, Paris, Thèse No. 16, 1814, pp. 19, 22, 24): Lecoeur, 50th line, shot through the right knee, at Salamanca, July 12, 1812; the ball traversed the joint; no bony lesion; death. A dragoon, 15th line, in Galitzia, in 1806, was shot in the left knee; ball lodged in the external condyle of the femur; incision made, and ball and large fragment of bone removed; death. A soldier, at Pultusck, December 26, 1806, received a shot fracture of the inner condyle of the femur, the ball traversing the joint; tumefaction; death. DEGUISE (CH.) (*Dissertation sur les plaies des articulations*, Paris Thèse, 1815, No. 4, p. 17): A sub-lieutenant of the 80th line; shot in Spain, through the knee; no lesion of bone; complete recovery. BLONDEAU (J.) (*Propositions de pathologie fondées sur des observations*, Paris, 1815, Thèse No. 64, p. 21, Obs. X): A soldier at the battle of Aropiles, in Spain, in 1810, was shot in the right knee, the ball lodging under the patella, whence it was removed; he recovered. BELL (C.) (*Report on Gunshot Wounds of the Knee Joint in Surgical Observations; being a Quarterly Report of Cases in Surgery treated in the Middlesex Hospital*, London, 1816, p. 429): D——, shot in the knee September 6, 1812; ball lodged in condyle of femur; recovery. TROWBRIDGE (A.) (*Gunshot Wounds*, in *Boston Medical and Surgical Journal*, 1838, Vol. XVIII, p. 342): Colonel McNeil, shot in the knee, at the battle of Bridgewater, July 25, 1814; the ball entered above the patella and injured the condyles of the femur; recovery, with partial anchylosis. MANN (JAMES) (*Medical Sketches of the Campaigns of* 1812–13–14, *etc.*, Dedham, 1816, p. 211): A soldier of the 33d regiment, admitted into hospital at Burlington with a shot wound through the knee; amputation proposed but refused; sinuses laid open and a spiral bandage applied from foot to trunk; recovery, with a stiff joint. EHRLICH (J. A.) (*Chir. Beobachtungen*, Leipzig, 1815, B. II, p. 115): A soldier of the 5th Italian regiment, aged 22, shot at Lützen, May 3, 1813, through the right knee joint, fracturing the external condyle of the femur and internal condyle of tibia; recovery, with anchylosis of joint. CHAMPION (L.) (*Traité de la Résection des os cariés dans leur continuité ou hors des articulations*, Paris, 1815, No. 11, p. 77, Obs. XIV): Chauveau, 42d demi-brigade, shot in the right knee, at Lützen, May 2, 1813; ball struck internal condyle of tibia and lodged, and was removed in April, 1814, by chiseling away the carious surface of the bone; recovery, with good use of limb. BLENKINS (G. E.) (Article *Gunshot Wounds*, in COOPER'S *Dictionary of Practical Surgery*, London, 1861, Vol. I, p. 816): A soldier of the 95th regiment was shot through the knee joint, at Merksam, near Antwerp, in 1814; he died after several months' suffering. CAMBRAY (*Journal de Chirurgie*, par M. MALGAIGNE, 1846, T. IV, p. 361): A young man, aged 15, shot through the patella, at the storming of Cambria, near Waterloo, in 1815; recovery. HENNEN (JOHN) (*Principles of Military Surgery*, London, 1829, p. 147 *et seq.*): A soldier, shot in the knee joint at the storming of Nivelle, Nov. 10, 1813, the ball perforating the joint; inflammation, and death on the fourth day. Lieutenant-Colonel R——, shot in the right knee joint, June 18, 1815; the patella was fractured; the missile lodged; recovered, with good use of limb, in about five weeks. Major B——, aged 28, received a shell wound of the right knee, June 18, 1815; the patella was fractured and the femur grazed; fever; swelling of lower part of thigh; incision on external part of thigh four inches deep; a pint of pus evacuated; July 6th, portion of patella removed; recovery, with complete anchylosis. BEGIN (L. J.) (*Mémoire sur le traitement des plaies des articulations*, in *Rec. de Mém. de Méd. de Chir., etc.*, 1825, T. XVI, 1st sér., p. 6): J. A——, chasseur, wounded at Barcellona, Spain, September 15, 1823; fracture of patella and condyle of femur; recovery. JOBERT DE LAMBALLE (*Plaies d'armes à feu*, Paris, 1833, p. 266 *et seq.*) gives brief details of 11 penetrating wounds of the knee joint from the revolution in Paris, in 1830; 10 recovered and 1 proved fatal. In the fatal case the femur and tibia were interested; of the 10 cases of recovery the condyles of the femur were injured in 5, and in 5 there was no bony lesion. LARREY (H.) (*Rel. chir. des événemens de Juillet*, 1830, Paris, 1831, p. 110): C——, 50th line, in July, 1830, received a shot in the left knee; the internal condyle of the tibia was fractured; swelling, pain, and infiltration, and death on August 25, 1830. MENIÈRE (P.) (*L'Hotel Dieu de Paris en July et Aout*, 1830, Paris, 1830, pp. 314–320) briefly cites 5 cases; 4 were fatal and the result in 1 is not indicated. In one case the head of the tibia was fractured; in the other 4 cases no mention is made of fracture of the bony structure. ARNAL (*Mém. sur quelques particularités des plaies par armes à feu*, in *Jour. univ. et hebd. de Med. et de Chir.*, Paris, 1831, T. III, p. 38) alludes to 8 cases of shot wounds of the knee joint, with injuries of the bony structure; all recovered with false anchylosis. DE MORTAIN (*Observation d'un coup de feu ayant traversé l'articulation tibio-fémorale droite; guérison avec ankylose*, in *Rec. de Mém. de Méd. de Chir. et de Phar. Mil.*, 1839, 1st sér., T. XLVI, p. 99): C——, 48th line; perforation of knee joint; articular surfaces ploughed through; recovery, with anchylosis. ALCOCK (R.) (*Observations on injuries of Joints*, in *Med.-Chir. Transactions*, 1840, Vol. XXIII, pp. 260, 261) tabulates 18 cases of shot wounds of the knee joint: 3 recovered, 15 were fatal. HOME (WILLIAM) (*Report on various cases of Gunshot Wounds received in actions in Upper Canada, in* 1838, in *Edinburgh Med. and Surg. Jour.*, 1840, Vol. LIV, p. 28) relates a case of fracture of condyle of femur, the ball traversing the joint; recovery, with anchylosis. WARD (BRANSBY COOPER, *The History of a Gunshot Wound in which the Patella was carried away and the Knee Joint completely laid open*, in GUY'S *Hospital Reports*, 1840, Vol. V, p. 88): E. M——, patella shot away, November 2, 1838; joint opened; recovery, with considerable motion of joint; walks without a cane. BAUDENS (L.) (*Clinique des Plaies d'Armes à feu*, Paris, 1836, p. 446): A sergeant, 20th regiment, in 1831, was shot through the condyles of the right femur; small fragments of bone removed from osseous channel; recovery, with slight anchylosis. WILLIAMSON (G.) (*Military Surgery*, London, 1863, p. 172) cites a case from the war in India, in 1833: E. Marr, 20th regiment; patella fractured, joint opened October 21, 1833; recovery, with anchylosis; died 19 months later, of disease of the liver. LEBERT (*Obs. Cliniques sur les plaies d'armes à feu et sur quelques autres blessures*, in *Arch. Gén. de Méd.*, 1845, T. VII, IV sér., p. 327): Ottwiller, aged 24, wounded at Trient, May 21, 1844; joint perforated; recovery, with good use of limb. Coudray, aged 35, ball passed through the joint behind the patella; several pieces of the patella and head of the tibia removed; severe pain and inflammation; death. The space assigned to this section of Chapter X will not permit a detailed reference to the cases of shot wounds of the knee joint treated by conservation during the last 30 years. A numerical statement of these cases will be given in the concluding remarks of this section of Chapter X.

was sent to the rear, where he was examined by Assistant Surgeon A. J. Baxter, U. S. A., who stated that he found the inner condyle of the femur fractured and that he passed his finger into the joint. The patient was subsequently sent to New York, where he came under the care of Dr. Willard Parker. Surgeon J. F. Hammond, U. S. A., August 19, 1862, certified to a description of the wound and stated: "The knee is swollen and the joint semiflexed. The orifices of the wound are healed, but one retains the crust. It is subjected to passive motion and gradual extension." In a certificate dated three months later, Surgeon Hammond reported: "He is gradually convalescing from the gunshot wound of the knee joint described in my former certificate. He cannot flex his leg quite to a right angle, and the knee becomes painful and swollen when exercised," etc. Surgeon Grant added to his report that Captain Fisk ultimately recovered, and served as Assistant Adjutant General in the Department of the East. He was mustered out of service November 22, 1865. He did not apply for pension until nearly thirteen years afterwards, when the New York City Examining Board described his condition as follows: * * * "Circumference of right knee over patella one-half inch larger; loss of bone probably from both the femur and tibia; bony projection on one side of aperture of exit. Motion of extension nearly complete; flexion one-third impaired. External curvature of the limb at knee joint. Crepitus on motion in joint; pain from effort always, from change of weather, and also from maintaining one position; walking and standing particularly irksome," etc. Captain Fisk was paid as a pensioner, September 4, 1879.

CASE 547.—Private P. Stuck,[1] Co. E, 116th Pennsylvania, aged 18 years, was wounded in the right knee, at Spottsylvania, May 12, 1864, and entered Douglas Hospital, Washington, six days afterwards. Acting Assistant Surgeon H. Gibbons, jr., described the case as follows: "The missile, probably a minié ball, entered at the inner border of the patella and escaped a little external to the center of the popliteal space, going directly through the joint and grooving the articular surface of the internal condyle, but passing mainly through the intercondyloid notch. The patient was a man of delicate organization. He had but little constitutional disturbance and not much inflammation in the joint, which, however, was somewhat swollen. Simple water dressings were applied. The discharge was free, abundant, and thin, the pus being mixed with synovial fluid. On June 9th, there was some loss of appetite, with small, frequent pulse, and the patient complained of pain in the knee, which was swollen considerably. Flaxseed poultices, applied for two or three days, procured a free discharge from the posterior wound (the anterior wound having healed), when the symptoms immediately abated. In the latter part of August the patient began to walk about on crutches, the leg being flexed at an angle of about 135° with the thigh. The discharge was now not so copious, nor the pain at all severe; his appetite was fair, bowels regular, sleep refreshing, etc., as had indeed been the case during the greater part of the time. In the latter part of October, in order to reduce the flexion, the limb was bandaged to a double-inclined plane splint, which resulted in almost entire extension without occasioning any bad symptoms in the joint or confining the patient to his bed. For the following eight months nothing of special interest occurred, though there were several inflammatory attacks, moderate in degree and readily subdued by poulticing. On these occasions abscesses sometimes formed on the posterior thigh. The case is doubly interesting from the fact that the wound only received the ordinary dressing of cold water on cloths, with charpie to absorb the discharge. Tincture of iodine and poultices, or hot fomentations with flannel covered with oiled silk, were used when signs of inflammation showed themselves. No ice was used in the treatment. A photograph (*Surg. Phot. Series*, No. 63, A. M. M.) of the patient, taken July 9, 1865, is represented in FIG. 2 of PLATE LXVIII. The soldier was discharged from service July 13, 1865, in good health, the posterior wound being still open and permitting the introducing of a probe for three inches. There was also a large deposit of new bone, and the patella was firmly anchylosed to the femur. Some motion of the joint remained." Examiner H. Brubacker, of Somerset, Pennsylvania, certified, September 23, 1867: "The knee is very much enlarged, and the muscles of the thigh are gradually shrinking away. The wound is still discharging pus very freely, and there is evidently some disease of the bones about the joint, which keeps up the discharge." In January, 1876, the same examiner reported: "The joint is completely anchylosed and the leg flexed upon the thigh, so that the heel cannot be made to touch the ground. He walks on the front of the foot. The ball of the foot behind the great toe is enlarged, hardened, and tender, which renders walking very difficult. The leg, including the thigh and hip, is becoming atrophied. His condition is gradually growing worse." The pensioner was paid March 4, 1880.

CASE 548.—Private J. C. Simmerman, of the Marine Corps, aged 21 years, while serving on board of the U. S. Steamer Minnesota, was wounded in the knee during the attack on Fort Fisher, January 15, 1865. He was treated at the Naval Hospital at Portsmouth, whence he was discharged June 19, 1865, and pensioned, by reason of "shot wound of left knee joint, causing compound fracture, and resulting in anchylosis of the joint with incapacity to use the leg, which may ultimately require amputation." In the succeeding year, while at Philadelphia, the pensioner presented himself for treatment to Dr. G. H. Napheys, formerly connected with the Navy and with the Army, who made the following report of the case (*Medical and Surgical Reporter*, Vol. XVI, 1867, p. 307): "He was struck, while lying down, by a grapeshot entering the inner condyle of the femur and passing through the articulation. When discharged from hospital his knee was perfectly stiff and flexed at right angle. Afterwards there was a constant discharge and the passage from time to time of pieces of bone from the part, the last fragment coming away in June, 1866. When he presented himself at the clinic he had bony anchylosis of the wounded knee, and the leg was flexed at such an angle with the thigh that the distance between the heel and the corresponding buttock was only seven and a half inches. The operation consisted in breaking up the extensive osseous adhesions by means of perforators and other instruments. The hamstring muscles were divided subcutaneously. The limb was then bandaged throughout its whole length. It was afterwards placed upon a double-inclined plane with a screw arrangement, so that it could be gradually brought down. About two months after the operation the limb was straightened sufficiently to enable him to rest on the ball of the foot, which is all that can be desired. The heel is somewhat elevated; it will be brought down at some future time by dividing subcutaneously the tendo-Achilles. He walks readily by the aid of a cane. On April 1, 1867, the patient writes that he has good motion of the ankle joint and walks with increasing ease and comfort." The Philadelphia Examining Board, in 1873, and at subsequent dates, certified to the injury and to firm anchylosis as resulting therefrom, together with dislocation of the tibia backwards. In 1873, the leg was described as being flexed at an angle of 25°, and two years later at 40°, with the heel drawn up two and a half inches. An operation on account of necrosed bone is also alleged to have been performed.

PLATE LXVIII.—RESULTS OF SHOT INJURIES OF THE KNEE-JOINT.

1. Case of Lieutenant T. W. Robertson
29 9th New York.

2. Case of Private Peter Stuck
116 Pennsylvania

LIBRARY
OF THE
UNIVERSITY
OF
CALIFORNIA

Examiner J. A. Armstrong, of Camden, reported, September 17, 1877: "At present the leg is in a straight position, the knee joint anchylosed, and the parts surrounding it calloused and indurated." At a subsequent examination by the Board the thigh and leg were represented as being much wasted, and the condition of the foot was described as that of a case of "talipes equinus." The pensioner was paid December 4, 1879.

CASE 549.—Private N. Gray, Co. H, 4th Maine, aged 24 years, was wounded in the right knee joint, at the Wilderness, May 5, 1864, and entered Harewood Hospital, Washington, three weeks afterwards. Surgeon R. B. Bontecou, U. S. V., contributed the following history: "The ball entered in the middle of the internal condyle three-fourths of an inch above the inferior margin, passing in an oblique direction inward and downward. At the time of his admission the general state of his health was good and color of skin normal; knee joint a little swollen. The patient complained of a fixed pain right below the centre of the patella, which was increased by pressure upon the patella. The thigh was swollen, especially on the inner side, about five inches upward, and fluctuating. On enlarging the opening upward a quantity of pus was discharged and the ball was discovered and removed. The hole made by the ball was one inch deep; its direction inward and downward. An ice bag was applied to the joint. On June 2d, an incision was made in the fossa poplitea three inches long, and the lower third of the posterior side of the femur was found to be surrounded with pus, but the bone was yet covered with periosteum. The discharge was free and copious; the ice was still kept on. On July 20th, there was œdema of the right leg, which was bandaged from the toes to the knee joint; discharge healthy and copious. Solution of chlorinate of sodæ was now used in the dressing. By September 1st, the wound was doing well, discharging but little, and the incision in the fossa poplitea being healed. Exudation below the patella had disappeared, and the movements of the knee joint were perfectly free and painless. The patient went on furlough, and returned on September 14th. Small pieces of bone were coming from the wound in the condyle; movement of the joint perfect. On December 1st, erysipelas of the right leg commenced below the patella, attended with high fever, vomiting, and headache. For this ten drops of muriated tincture of iron were given every three hours. By December 10th, the erysipelas had disappeared and the patient was doing well. The process of exfoliation was going on slowly on January 1, 1865. On February 13, 1865, the patient was discharged from service, the process of exfoliation not yet having terminated, but the knee joint being of normal size and color, and its movements perfectly free and painless in every direction." Examiner I. H. Harding, of Ellsworth, Maine, February 1, 1867, certified to the injury and added: "The joint and leg are weakened and atrophied so much that he walks quite lame." The Boston Examining Board reported, September 13, 1875: "There are two large adherent cicatrices in the popliteal space, which impair the motions of the hamstrings." The pensioner was paid December 4, 1879. The wood-cut (FIG. 222) is a copy of a photograph contributed by Surgeon Bontecou (*Card Photographs*, Vol. 3, p. 22).

FIG. 222.—Shot fracture of internal condyle of right femur. [From a photograph.]

In the next instance a conoidal ball struck the left knee, passing through the centre of the patella and through the inner condyle of the femur:

CASE 550.—Private J. T. Long, Co. G, 16th Wisconsin, aged 26 years, was wounded at Shiloh, April 6, 1862. Acting Assistant Surgeon J. A. Murphy, in charge of Third Street Hospital, Cincinnati, described the injury as "wound of the left knee joint," and reported: "A ball entered the centre of the patella and passed inward and backward, escaping through the inner condyle of the femur. The patient entered this hospital May 2d, having been brought here on a hospital boat from Pittsburg Landing. He was free from fever and diarrhœa, and his general health on admission was excellent. In stature six feet and two inches, well and strongly developed in every respect, he was a man who had always enjoyed very good health and never indulged in ardent spirits. The injured joint was much swollen and very red when he arrived here; a copious discharge of pus and synovial fluid was escaping from the wounds. A few days afterwards a large abscess, exterior to the joint, developed itself and was opened, discharging about one pint of pus. After this, from time to time until the wounds healed, sixteen abscesses formed around the joint and in the leg as low down as the middle third. They were opened and healed readily. Cold-water dressings and fomenting poultices were the only applications used to the wounds. He was kept on low diet throughout the treatment. Tonics were given for a very short time and then discontinued, as the inflammation about the wound seemed to increase under their use. On the subsidence of the inflammation about the joint crepitation could be heard in moving the patella; a fissure could also be felt in the patella. On July 16, 1862, the patient was discharged from service. At that time he had mobility of the joint and was able to walk with great ease to himself. Just before completing extension or flexion, however, he would feel a slight obstruction, causing him to make an increased effort to complete the extension or flexion, when the former or the latter was accomplished." The man subsequently became a pensioner, the nature of his injury being corroborated by various examining surgeons, the last of whom, Dr. W. T. Nichols, of Menomonee, stated November 17, 1877, that "the wounded joint is weak and the leg a little lame." The pensioner was paid June 4, 1879.

CASE 551.—Sergeant P. H. McGrew, Co. F, 17th Ohio, aged 22 years, was wounded in the left knee while on picket near Corinth, May 22, 1862. He was discharged from service at Camp Chase, March 18, 1863, Surgeon D. Stanton, U. S. V., certifying to "partial anchylosis and necrosis of head of tibia resulting from a shot wound through the knee joint." Dr. W. L. Schenck, late Surgeon 17th Ohio Volunteers, who personally treated the case, communicated the following history: "The missile, supposed to have been a small conical ball, entered just above the outer tuberosity of the left tibia and passed diagonally through the joint, slightly fracturing the articulating surface of both condyles of the femur and the spine of the tibia. I was at

the Brigade Hospital at the time, a mile or two in the rear, and did not see the wound for two days. The knee had become very painful then and was greatly swollen, so I concluded there was no time to consider the propriety of an operation, and put the patient upon active antiphlogistic treatment with irrigation to the parts. The next day Medical Directors Smith and Strew, with several other surgeons, called to see the case, and all, excepting Surgeon I. A. Coons, 38th Ohio, and myself, decided in favor of exsection or amputation; but I was allowed to use my own judgment, declined to operate, and continued the treatment. When the acute stage had passed and suppuration was well established, I used water dressings and prescribed a liberal diet, with some preparation of iron—hydrochlorate of the sesquioxide, iodide, citrate with quinine, or phosphate with lime, etc. When the pain was intense or destructive metamorphosis greatly in excess, opium and brandy was administered. On the 15th of June, I received a leave of absence, and was permitted, through the kindness of the General Commanding and the Medical Director, to take the patient with me to Ohio. He was carried on a stretcher over all the bad roads from Corinth to Pittsburg Landing and there placed on a cot, from which he was not removed until he reached my home in Franklin, Ohio, where I treated him until the expiration of my furlough. During that time several small pieces of bone were removed, and when I left him the outer wound had healed and he was able to go about his room on crutches. I left him in charge of the Ladies' Aid Society, who cared for him until he was able to go to his home in Lancaster, Ohio. On the 15th of December following he wrote to me: 'Since leaving Franklin there have two tolerably large and twenty-three small pieces of bone come out of my knee. It is getting along fine. I can put out my foot and take a good old-fashioned step, such as I used to take in the long marches down in Dixie. I do nothing for it now but wash it in salt water. I am in a hurry for it to get well that I may get satisfaction out of those rebels,' etc. After McGrew had been discharged from service for disability, he recovered sufficiently to again enter the army, and accepted a commission as 1st Lieutenant of the 178th Ohio. On April 2, 1865, he wrote to me from Shelbyville, Tennessee: 'Thanks to you this leg of mine, which so many predicted would have to come off or be worthless, is worth a good many cork legs yet. I can do anything with it but run, and that is not in our line. I was at a ball the other evening and danced several sets. That is better than even you expected.' By this time the injured joint was sound and the leg could be straightened or bent to a right angle." Lieutenant McGrew left the service in April, 1865. He had been a pensioner under his former designation until his re-entry into the service in September, 1864, since when he has not communicated with the Pension Bureau. Drawings of the wounds of entrance and exit, shown in the wood-cuts (FIGS. 223, 224), were contributed by Dr. Schenck.

FIG. 223.—Wound of entrance at left knee. [From a sketch by Dr. SCHENCK.]

FIG. 224.—Wound of exit at left knee joint. [From a sketch by Dr. SCHENCK.]

In the following remarkable case the ball passed diagonally through the left elbow, entered the left knee joint, and lodged in the outer condyle of the femur, where it remained innocuously for over fifteen years:[1]

CASE 552.—Lieutenant E. B. Blake, Co. F, 35th Massachusetts, aged 25 years, was wounded at the battle of Antietam, September 17, 1862. While he was stooping down to tie his handkerchief around the thigh of a bleeding comrade whose leg had been carried away by a cannon ball, he received a shot which passed diagonally through the left elbow and entered the outer aspect of the left knee joint. Copious bleeding from the exit wound in the elbow denoted injury in the large vessel. The bleeding was checked by a strap around the arm. He limped off on his injured leg to the nearest ambulance station, where the wound in the knee joint was examined by a surgeon. The probe entered the joint freely; but the ball could not be detected. From the strongly bent position of the limb, it had apparently escaped the tibia and passed in between the condyles of the femur, where it was securely lodged and concealed. His arm and leg had water dressings applied, and were put in splints; and he was immediately placed in the cars and transported to Boston, where he arrived in the course of a week, with many other soldiers, some of whom had received equally serious wounds, and to whom the danger of transportation, except under existing circumstances, would have been considered almost a fatal movement. The foregoing account is taken from J. Mason Warren's *Surgical Observations, with Cases, etc.*, Boston, 1867, p. 563. Dr. Warren attended Lieutenant Blake on his arrival in Boston. He was then in a feeble condition, having an almost constant diarrhœa. Dr. Warren remarked: "It is probable that to this condition he owed his safety." The knee joint was free from pain and inflammation, but the wound on the outside suppurated slightly. It was dressed with a ham splint and kept in a state of entire rest. The elbow joint was quite loose, both condyles broken off, the joints swollen, with an effusion on

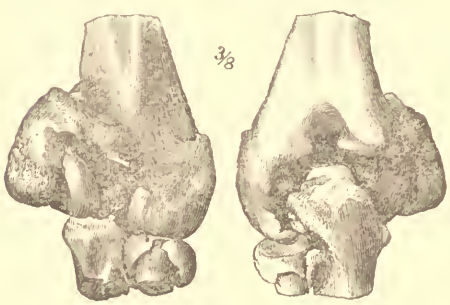

FIG. 225.—Anterior and posterior views of the left elbow joint. *Spec.* 6811.

[1] Examples of missiles remaining lodged in the bones of the knee joint have been reported by PERCY (*Manuel du Chirurgien d'Armée ou Instruction de Chir. Mil.*, Paris, 1792, p. 164), who alludes to a case in which the missile became incrusted in the condyles of the femur "hasard heureux dont on a eu un exemple dans la personne de M. d'Almons, ingénieur employé dans la dernière guerre." RABASSE (L. J.) (*Considérations générales sur les plaies des articulations faites par les armes à feu ou les instrumens tranchans*, Paris, 1811, Thèse No. 84, p. 18) reports that Weber, a miner at the siege of Dantzig, in April, 1807, was struck by a ball at the outer portion of the left knee joint. From the depression and cavity in the external condyle of the femur the ball was believed to have lodged in the articulation, as there was no wound of exit. Futile searches for the missile were made; extensive swelling followed, but the patient recovered in about three months with anchylosis of the knee. BELL (C.) (*Report on Gunshot Wounds of the Knee Joint in Surgical Observations; being a Quarterly Report of Cases in Surgery treated in the Middlesex Hospital*, London, 1816, p. 429): Russian General Baron Driesen, wounded at Borodino, September 6, 1812; musket ball struck the inner condyle of the left femur; ball remained in condyle; improved in spring of 1813. Wound closed and reopened in 1816; inflammation, abscess, incision; amputation January 7, 1817; recovery. ALCOCK (R.) (*Observa-*

the inside, a bullet hole below the joint on the outside and above it on the inside. The elbow was made immovable with splints, and, after a moderate amount of inflammation, which at no time amounted to anything threatening, both the knee joint and the elbow joint did perfectly well; and at the end of two months he was able to go out of doors. He finally recovered all the motions of the elbow joint; he could walk without the least sign of lameness, the ball still remaining in the knee. The power of entire flexion only of the leg was wanting. He continued actively engaged in business until February 11, 1878, when he died of pneumonia. An autopsy was made by Dr. J. Foster Bush,[1] of Boston, who presented the specimens of the injured elbow and knee to the Army Medical Museum, where they are numbered 6811 and 6812, respectively, of *Section I.* There was not a trace of caries in the cancellated structure around the ball. The articulated cartilages were perfectly smooth, and the foreign body had apparently remained innocuously in the outer condyle for over fifteen years. The bones of the elbow are shown in the wood-cut (FIG. 225); the articular extremities of the femur and tibia (*Spec.* 6812, and *Photo. Series*, No. 366, A. M. M.) are represented in PLATE LXVII, opposite p. 372, a vertical section of the femur bisecting the ball.

CASE 553.—Private J. McDonnell, Co. C, 124th Ohio, was wounded at Chickamauga, September 19, 1863, by a conoidal ball, which entered over the inner crest of the left tibia, passed upward through the inner condyle of the femur and lodged. He was made a prisoner, and confined at Richmond, Danville, and Andersonville. Treatment: Two stitches in the wound and cold-water dressings. A portion of the ball was removed, also sixteen spiculæ of bone at various times. He suffered from scurvy whilst in prison; was exchanged March 28, 1865, and finally discharged from service July 8, 1865, from Camp Chase, Ohio. He received a pension of six dollars per month. Mr. McDonnell called at the Army Medical Museum September 17, 1872, made the above statement, and exhibited his wound, when the photograph (No. 329, *Surg. Phot. Series*, A. M. M.) was taken, of which the annexed wood-cut (FIG. 226) is a copy. His general health was indifferent. There was a large cicatrix on the inner side of the knee joint, and several smaller ones about three inches above the outer condyle; there was tenderness and preternatural mobility about the joint; it seemed to have undergone a spontaneous dislocation, the femur and patella projecting forward over the tibia. The foot could be inverted and everted much farther than usual, and the limb was shortened about two inches. He could walk with comparative ease, and could readily ascend a stairway. A plaster cast of the injured knee was made and numbered 6199 of the Surgical Series. His pension was paid December 4, 1879.

FIG. 226.—Appearance of knee joint nine years after injury. [From a photograph.]

In the next case a round musket ball passed through the middle of the patella and, perforating the joint, crushed the articular ends of the femur and the tibia:

CASE 554.—Private X. Gauter, Co. D, 14th Missouri Home Guards, aged 18 years, was wounded in the right knee, at Lexington, September 18, 1861, and was conveyed to St. Louis one month afterwards. Assistant Surgeon S. M. Horton, U. S. A., in charge of the New House of Refuge Hospital, reported: "This is a case of gunshot wound through the knee joint, which at present (September 17, 1862) is discharging sanious pus at the point of entrance, from which pieces of necrosed bone are being extracted every few days. The use of the limb is but partial, the joint being rendered immovable. The patient came here from the City General Hospital on 5th Street seven months ago. He had been wounded by a round musket ball, which penetrated the patella through its centre, going right through the joint and escaping through the popliteal space, crushing in its course the articulating ends of the femur and the tibia." The patient was discharged from hospital June 3, 1863, and pensioned, his term of service having expired one month after being wounded. Examiner W. P. Boulware, of Lexington, Missouri, at successive dates certified to the injury and reported anchylosis of the knee joint as resulting therefrom. Dr. F. Cooley, of the Kansas City Examining Board, reported September 17, 1875, that he found "depression with adherent cicatrix over the patella, and also adherent cicatrix with considerable loss of bone on outer condyle of femur, so that I can pass my fingers into it for three-fourths

---

tions on Injuries of Joints and their Treatment, in *Medico Chirurgical Tranasactions*, London, 1840, Vol. XXIII, p. 298) records a case in which the ball remained in the condyle for four years: "A sailor of a man-of-war steamer, in 1836, received a musket shot while rowing a boat employed in the disembarkation of troops. He was immediately forwarded to one of the hospitals, under my direction, in San Sebastian. Although there was every reason to believe that the ball had lodged in the cancellated structure of the femur, yet, from the absence of any detached portion of bone, or rough fracture in the articulating surface of the bone, so far as I could ascertain, I felt warranted in an endeavour to save the limb. In a few weeks the wound healed, and the knee, to all appearance, was undiseased,—the patient only complaining of some weakness and difficulty in walking, with occasional pain; he was invalided home. Three months ago he came to me with a request that I would amputate his leg, for that, to use his own expression, 'it so bothered him' in walking, and gave him occasionally such acute pain, that he would infinitely rather stump about on a leg of wood. Not being attached to any metropolitan hospital, I sent him down to the Westminster, to my friend, Mr. GUTHRIE, who removed the leg, which externally presented a cicatrix, but no other mark of injury or disease, past or present. The ball was found to have passed through the internal condyle, and presented a somewhat flattened, yet convex, smooth surface, on a level with the articulating surface, resembling a piece of metal let in. It had fissured the bone (as may be seen in a very slight and hasty sketch I made at the time) and this fissure *had been nearly entirely filled up with osseous matter.* In four years the only mischief done to the joint was some thickening of synovial membrane and a partial absorption of cartilages. No very active, acute, or destructive disease had been developed either at the time of the accident or since." ROCCO GRITTI (*Nuovi Documenti in favore della cura conservativa nelle fratture del femore per arma da fuoco*, in *Annali Universali di Medicina*, Melano, 1868, Vol. CCV, p. 524, case 37): Pompeo Morandi, 3d Volunteers, wounded at Monte Suello; wound of knee joint with lodgement of the ball in the condyle; recovery. The ball remains in the joint, which is anchylosed. STROMEYER (L.) (*Erfahrungen über Schusswunden im Jahre* 1866, Hannover, 1867, p. 58) remarks: "Among the noteworthy cases of shot fractures of the knee joint treated by conservation, is the case of a young officer, the bullet yet remaining in the outer condyle of the left femur. . . At present there is no exudation into the capsule, and the ball lies so near the surface that it can be felt through the soft parts covering it. But as it is nearly immovable, and causes hardly any suppuration, it has been considered the wisest course to avoid operative interference." GROSS (S. D.) (*A System of Surgery*, Philadelphia, 1872, 5th ed., Vol. I, p. 1039): Knee joint opened by a pistol ball, which lodged permanently in one of the condyles of the femur; recovery with slight lameness.

[1] BUSH (J. F.), *Penetrating Gunshot Injury of the Elbow and Knee Joints*, in *Boston Medical and Surgical Journal*, 1879, Vol. C, p. 144.

of an inch. There is also loss of portion of the tibia some four inches below the patella, and I find very large varicose veins of the leg and thigh. The knee is entirely anchylosed. Just below the condyle, on the outer part, there is a small hard substance, the size of a goose-shot, floating under the skin. The muscular tissues on the outer and lower part of the thigh are destroyed. I also find shortening of the limb one and a half inches, and the old cicatrices look as though they might break out at any time," etc. Subsequently the same Board found increase of size and number of varicose veins, tumefaction of limb, etc. The pensioner was paid December 4, 1879.

In the following four cases the patella was fractured. In two of the cases the synovial sac was involved; in one instance both knees were injured:

CASE 555.—Private W. H. Hirst, Co. A, 118th Pennsylvania, aged 22 years, was wounded through the left knee, at Shepherdstown, September 20, 1862. Surgeon J. Neill, U. S. V., reported: "The wounded man was admitted to Broad and Cherry Streets Hospital, Philadelphia, September 27th, with a compound comminuted fracture of the patella involving the knee joint. The injury was produced by a minié ball, which entered in front, one inch above the patella, passed downward and outward, and made its exit on the outer side of the leg just below the head of the fibula. At the time of admission the patient's general condition was good, but the knee was very much inflamed and the wound suppurated freely. Flaxseed poultices were applied around the joint, and the limb was kept at rest in a fracture box; the patient was ordered a good diet, with tonics and stimulants. A few days afterwards a large abscess formed on the outer side of the thigh a short distance above the joint, which was opened and discharged freely. Under the treatment adopted the patient improved rapidly, the limb bidding fair to be a useful one. One fragment of bone was extracted." The fragment of the patella removed from the wound is *Specimen* No. 670 of the Army Medical Museum. The patient was subsequently transferred to Haddington Hospital and thence to Christian Street. On July 4, 1864, he was discharged from service and pensioned, Acting Assistant Surgeon R. J. Levis certifying to "wound of knee joint, resulting in great lameness from anchylosis." The Philadelphia Examining Board at various intervals certified to the injury and its results, and described the limb as wasted and the veins varicosed. The pensioner was paid December 4, 1879.

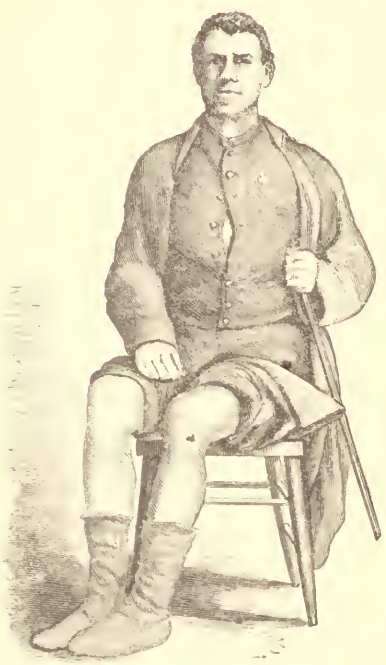

FIG. 227.—Appearance of knee joint a few months after injury. [From a photograph.]

CASE 556.—Corporal D. Golden, Co. M, 14th New York Artillery, aged 33 years, was wounded at Petersburg, June 17, 1864. He was admitted to the field hospital of the 1st division, Ninth Corps, where Surgeon M. K. Hogan, U. S. V., noted: "Wound of left knee by minié ball; simple dressings applied." From the field the wounded man passed to the Depot Hospital at City Point, and thence, on July 2d, to Harewood Hospital, Washington. Surgeon R. B. Bontecou, U. S. V., in charge of the latter, described the injury as "a wound through the patella," and reported that the patient was discharged from service April 14, 1865, for total disability. Examiner C. C. Bates, of Potsdam, N. Y., April 29, 1865, certified: * * "He can flex but cannot extend the leg, except enough to touch the toe to the floor. Thigh and leg much atrophied; knee much swollen and painful." Examiner G. R. Baldwin, of Fort Scott, Kansas, reported November 13, 1877: "The pensioner received a wound of the left knee. The ball entered at the lower border of the patella, passed outward and upward, and made its exit at the outer border of the patella. Synovial fluid escaped. There is a large, irritable, and tender cicatrix. The patella is immovably attached to the tibia. The leg requires rest, motion and strength being very much impaired. Pain is a prominent symptom." The pensioner was paid September 4, 1879. A photograph (*Card Photographs*, Vol. I, p. 17), represented in the annexed wood-cut (FIG. 227), was contributed by Surgeon R. B. Bontecou, U. S. V.

CASE 557.—Private W. Patterson, Co. K, 6th Wisconsin, aged 36 years, was wounded through both knees, at Gainesville, August 28, 1862. He was treated at Carver Hospital, Washington, whence he was discharged and pensioned December 9, 1862, Surgeon O. A. Judson, U. S. V., certifying to: "Shot wound of both knee joints, involving a fracture of the right patella and causing extensive effusion in the left knee joint." Examiner J. Hobbins, February 18, 1863, certified to "imperfect flexion and limited and difficult extension," resulting from the wounds. Examiner D. C. Green, of Mauston, Wisconsin, reported, April 28, 1870: "The wound was caused by a ball which entered the left knee at the left side and passed through, striking the bone. The missile then, being slightly turned in its course, struck the right knee and passed through it anteriorly, fracturing the patella and lacerating the muscles badly. At present both knee joints are stiff." Subsequent examiners report no additional information. The pensioner was paid December 4, 1879.

CASE 558.—Private J. W. Warrington, Co. C, 110th Ohio, was wounded on April 2, 1865, at Petersburg, by a round ball from a spherical case shell. The ball entered the centre of the patella, and, producing a stellate fracture of that bone, passed downward, backward, and inward, and was cut out, on the field, one and a half inches below the tuberosity of the tibia. On April 12, 1865, the patient was admitted into Judiciary Square Hospital. There was no pain in the knee joint, and but little swelling. The treatment had been limited to dressings of cold water, which were continued for a few days, and followed by applications of ice. The patient was removed to Douglas Hospital June 19, 1865, when three small necrosed fragments of the patella were removed. A photograph of the patient, taken July 9, 1865, is No. 64, *Surg. Phot. Series*, A. M. M. The wounds had healed and the patient walked about with a cane. There was at no time any indication of the formation of pus within the joint. The facts of the case were communicated by Acting Assistant Surgeon H. S. Colton. Warrington was discharged July 24, 1865, and pensioned. He was paid September 4, 1879.

Fracture of the head of the tibia and of the patella was noted in the next example:

CASE 559.—Corporal G. L. Keyser, Co. B, 8th Pennsylvania Cavalry, aged 21 years, was wounded at Snieker's Gap, November 1, 1862, and admitted to hospital at Knoxville two days afterwards. Surgeon B. Beust, U. S. V., reported: "A gunshot wound through knee joint. The patient, a man of small stature and delicate appearance, was in a kneeling posture when he was struck by a conical ball, which entered the right knee at the inner side of the patella, near the lower border, striking against the inner condyle of the tibia, producing considerable injury by shivering to some extent the epiphysis, and emerging on the outer side of the leg two inches below the joint. When the patient was brought here the knee was much swollen and painful. Applications of cold water were immediately made and continued for four weeks. When the active inflammation had entirely subsided, a small quantity of healthy pus was discharged from both openings. The patient, feeling strong and quite well at this time, became careless and moved his leg, in consequence of which very active and extensive inflammation set in. The cold-water dressings were then (December 3d) changed to warm flaxseed poultices. From the 15th to the 31st of December the patient suffered much from irregular chills, delirium, sleepless nights, and loss of appetite, and showed great symptoms of exhaustion. Large quantities of fœtid pus were discharged from both openings. On December 31st, an examination was made with the finger, which proved the upper portion of the tibia to be much fissured. Amputation was then proposed but objected to by the patient, who wished to save his limb if there was any possible chance. He continued to fail, and his night vigilance and loss of appetite persisted undiminished. On January 6, 1863, the fever assumed a periodical character, coming on in the afternoon. For this he was treated with quinine and morphine, followed by wine and cinchona bark. Since then he has improved rapidly. By January 31st, the patient had regained a good appetite, slept well, and was improving in strength; the discharge of pus was now very slight and healthy. He will undoubtedly recover if no unexpected change or accident occurs to intercept or impede the restorative progress." Three weeks later the patient was transferred to Camden Street Hospital, Baltimore, whence Acting Assistant Surgeon E. G. Waters reported the following result in the case: "When admitted his condition was moderately good, the knee being much swollen and inflamed, however, for which solution of lead and opium was applied. Small fragments of bone came away at various times from the external opening. Absolute rest was maintained, and mercurial ointment, with camphor, was used locally to diminish the swelling. On May 30, 1863, the patient was discharged from service, with his knee joint permanently anchylosed and some deformity consequent upon a partial dislocation of the extremity of the femur inwardly." The man became a pensioner; but in the following year he re-entered the army as Lieutenant of the 195th Pennsylvania, and while belonging to that organization sustained an additional injury to his wounded limb by a railroad accident in October, 1864. He was ultimately mustered out February 26, 1865, when his name was again placed on the Pension Rolls. Examiner J. S. Crawford, of Williamsport, at successive dates certified to the injury and its results, and added, in January, 1867, that the injured joint was very much enlarged. On July 16, 1873, he reported: "The leg is flexed on the thigh at an angle of about forty degrees, with an enlargement on the inside of the joint. The flexion of the knee shortens the limb, which throws the weight in walking on the toes and necessitates a high heel to the boot. The thigh and leg are both very much atrophied and he complains of soreness in the joint." No changes were reported in the condition of the patient in September, 1875, since when he has been exempted from further examinations. His pension was paid June 4, 1879.

In the succeeding six cases the seat of fracture appeared to be confined to the head of the tibia:

CASE 560.—Private John O'Neil, Co. M, 1st Artillery, aged 26 years, was wounded at Pocotaligo, October 22, 1862. On the following day he was admitted to hospital at Hilton Head, where Assistant Surgeon J. Bell, U. S. A., recorded: "Gunshot wound by a ball from a spherical case, in left side of left knee, entering deeply and lodging." The patient was subsequently transferred to hospital No. 1, at Beaufort, whence Surgeon F. L. Dibble, 6th Connecticut, reported that he was discharged March 7, 1863, by reason of "a gunshot wound involving the left knee joint." Examining Surgeon J. E. King, of Buffalo, certified May 19, 1863: "The ball entered near the head of the tibia, passing through and lodging in the popliteal space, whence it has been extracted by incision. The wound is healed, leaving the leg useless. There is complete anchylosis, and wasting of leg," etc. In February, 1867, the pensioner enlisted in the 44th Infantry (Invalid), in which organization he served until March 29, 1869, when he was again discharged. Examining Surgeon J. W. Toward, of Augusta, Maine, at various subsequent dates examined the pensioner, and described the injury by the ball "breaking both bones and remaining embedded in the joint. Leg quite crooked, appearing as if upper ends of bone had been pushed outward; knee slightly bent and perfectly stiff, swelling badly after walking; limb painful to hip joint." The pensioner was paid December 4, 1879.

A case in which the missile was extracted from the head of the tibia six months after the injury and the patient finally recovered with a useful limb, is reported by Surgeon R. A. Kinloch,[1] P. A. C. S. A brief abstract is appended:

CASE 561.—Private *L. C*——, 6th South Carolina, aged 17 years, was wounded at Seven Pines, May 31, 1862. The ball entered upon the inner side of the right knee, apparently, a line or two below the articulation; there was no orifice of exit. When wounded he was lying on his back, reloading his gun, with his knee slightly flexed. The patient walked some distance after he was shot without experiencing very great pain. On the following day he was sent to the St. Charles Hospital, at Richmond. The limb was then much tumefied and very painful. In the opinion of most of the examining surgeons the ball had lodged; but a few of them, after the progress of the case, were inclined to believe that it had escaped through the orifice of entrance. He remained in hospital until August 3d, never leaving his bed, and scarcely ever changing from the supine position; he suffered continually from fever, and a portion of the time from traumatic delirium. About the middle of October he tried the

[1] KINLOCH (R. A.), *Case of Gunshot Wound of the Knee Joint. Ball lodged in the Head of the Tibia—Extracted through the Joint Six Months after the Accident—Recovery with a Useful Limb*, in *Confederate States Medical and Surgical Journal*, 1864, Vol. I, p. 102.

use of crutches, but was compelled to take to bed again, and was a week in recovering from a very painful and inflamed condition of the limb engendered by the efforts he had made. The patient enjoyed the comforts of a home and good nourishing diet, and gained flesh and strength; but the irritation of the knee persisted in a sub-acute form, and the wound continued to discharge, the suffering being always less when the discharge was free. On November 23, 1862, he was seen by Dr. Kinloch. The limb was flaccid and attenuated. A fistulous opening upon the inner side of the joint, just below the articular margin of the tibia, indicated the original orifice of entrance, which was discharging a thin pus. The joint was imperfectly anchylosed; the leg very slightly flexed upon the thigh. Dr. Kinloch believed the ball had lodged in the head of the tibia and determined to search for it. On November 29th, the patient was fully chloroformed. A semi-lunar flap of integuments, including the fistulous opening, was dissected and turned up from the deeper tissues over the inner side of the joint; with the finger, and afterwards with a large probe, the track of the ball could be traced through the lateral ligament of the joint to the depth of several inches. The lateral ligament was incised freely and a piece of necrosed bone, a portion of the articulating surface of the tibia about the size of the last phalanx of the finger, was discovered and turned out. As the joint was but slightly flexed the finger could only advance to a certain depth because of the inner condyle of the femur. Forcible flexion of the joint was instituted and the finger pushed on into a deep cavity in the outer portion of the head of the tibia, where it rested upon the foreign body, which was seized with a pair of bullet forceps and extracted with great ease. It proved to be a large minié, much flattened, and having a piece of the patient's pantaloons attached. A sponge full of warm water was thrown two or three times into the joint to wash out the debris from the cavity in which the ball had rested. The tegumentary flap was brought into position and secured by three points of suture, only the dependent corner of the wound being kept open by a tent; the limb was extended upon a bolster, cold-water dressing applied, and a full anodyne administered. The wound healed kindly, and in three weeks the patient experienced a feeling of relief that he had not known since the accident. In a letter to Dr. Kinloch, dated April 23, 1864, the patient states: "The only drawback to my convalescence was an attack of erysipelas, in January 1863, which I attributed to imprudence in eating. On the 17th of February, 1863. I began to move about on crutches, the wound having entirely healed before this. Since then, the limb has gained rapidly in strength. In May, I laid aside my crutches and took to using a stick. I can now walk a mile without resting, and often walk some without my stick. My joint is stiff, but I think I shall some day be able to run. I can now run a few steps, and can truly say the leg is well. I practise walking without my stick as much as I can."

CASE 562.—Private M. Hoffman, Co. H, 8th New Jersey, aged 21 years, was wounded at Williamsburg, May 5, 1862. He was admitted to the field hospital at Allen's Farm, where his injury was recorded as "a serious wound of the left knee joint." From the field the wounded man was moved to Hygeia Hospital at Fort Monroe, whence he was sent to his home on furlough May 21st. Surgeon R. B. McCay, U. S. V., reported that the patient was discharged from Chesapeake Hospital September 6, 1862, by reason of "partial stiffness of the knee joint resulting from the wound." The man was subsequently admitted on the Pension Rolls, his physicians certifying to the following description of his injury: "A ball entered the popliteal space, passed into the knee joint, and produced partial anchylosis, within all probability obliterating the synovial sac; perceptible crepitation resulted, together with inability to extend the limb." Assistant Surgeon R. B. Browne, U. S. V., who contributed the photograph of the patient (*Contributed Photographs*, Vol. XII, p. 5) shown in the adjoining wood-cut (FIG. 228), reports the following history: "The missile entered about one inch below and behind the knee, directly in the median line of the limb, passed upward, forward, and inward through the head of the tibia, and lodged, as was surmised at the time, somewhere in the centre of the joint, between the head of the tibia and the internal condyle of the femur. After his admission into hospital the patient was strongly advised to submit to amputation of the thigh. To this he stoutly objected, however, and shortly afterwards he was sent to his home on furlough, where I saw him and commenced the treatment of his case somewhere about the 1st of June, 1862. I searched carefully for the bullet but was unable to reach it. The patient had but little pain, was in good health, strong and robust, and the wound suppurated nicely. There was little or no inflammation of the joint, nor could I detect any synovia in the discharge. The treatment was therefore simple. I made use of emollient applications and enjoined rest, but not perfect rest, as I permitted him to move carefully about the house. The wound healed about the middle of July, from which time he was able to go about on crutches, the limb being flexed at an angle of 135°, or rather incapable of extension beyond that point. About the middle of the following September I entered the army as Surgeon of the 31st New Jersey, and consequently lost sight of the patient until the summer of 1863, when I was mustered out. At this time he had regained some mobility of the joint and could, by giving the limb a peculiar twist, make apparent the position of the bullet. He himself at least was so confident of its whereabouts that I concluded to cut down to the point indicated with a narrow-bladed bistoury. This operation I performed on September 7, 1863, being aided by Dr. Edward Swift, of Easton, Pennsylvania, who put the patient under the influence of an anæsthetic. I entered the knife immediately over the middle and inside of the joint and fortunately struck the bullet in its centre, about an inch below the integuments. I then enlarged the opening just far enough to enable me to extract the missile with the aid of a forceps, and quickly closed the wound so as to admit as little air as possible. A small quantity of synovial fluid made its escape. The ball, which proved to be a spherical one, five-eighths of an inch in diameter, was slightly battered, and appeared to have embedded itself between the articulating extremities of the femur and the tibia, being fairly covered by the synovial sac. The limb was then placed in a splint and kept at perfect rest until all fear of inflammation of the joint had subsided. The wound healed by first intention, and in one month the patient was again able to get about with the aid of crutch and cane, both of which he dis-

FIG. 228.—Shot perforation of the head of the left tibia. [From a photograph.]

pensed with after a period of five months. When last I saw him, in July, 1868, the man was walking with scarcely a limp, free from all pain, in perfect health, and without deformity excepting a slight bony prominence where the ball had been extracted. The joint retained all its motions except that of extension, which was limited, the leg assuming an angle of about 170° when fully extended." Various examining surgeons at successive dates have certified to the pensioner's disability, which is rated one-half. His pension was paid June 4, 1879.

The following interesting case was reported to this Office as an illustration of controlling inflammation of the knee joint through ligation of the femoral artery. The details were given by Assistant Surgeon A. A. Woodhull, U. S. A., in an essay on "*Ligation of Arteries as a Means of modifying Traumatic Inflammation of the Joints*," read before the Atlanta Academy of Medicine, at its meeting,[1] June 1, 1874. The subject of preventing or controlling inflammation of the joints through cutting off the supply of blood was, in the early part of the present century, considered by D. L. Rogers:

CASE 563.—Captain W. H. Jordan,[2] 9th Infantry, was wounded in the right knee, at the battle of Gaines's Mill, on the afternoon of Friday, June 27, 1862. "I saw him not far from the line of battle shortly after he was shot, and had him conveyed to my field station hard by. By examination with the little finger I satisfied myself that the joint was perforated and that the articulating surface of the tibia was grooved as if by a round ball or buckshot. He was immediately put into an ambulance wagon and sent across the Chickahominy to the field hospital at Savage Station, a few miles distant. This was the general rendezvous for the disabled of General McClellan's army, and in addition to the commissioned medical officers there were present a few civil surgeons who had volunteered their temporary services. Among them was Dr. David L. Rogers, of New York, who had long been an advocate of the control of traumatic inflammation of the joints by the ligation of the main artery of supply.[3] As I am informed, the wounded officer would not consent to primary amputation as was proposed, and Dr. Rogers then suggested the ligation of the femoral at the apex of Scarpa's triangle, with the view of preventing, or at least of modifying, the inevitably ensuing inflammation of the joint. This was acceded to, and it was at once done I believe by Dr. Rogers himself. The operation must have been performed within forty hours of the reception of the injury, and was probably done on the succeeding day, for the hospital was abandoned on Sunday, the 29th, the second day after the battle. The general belief that the serious operation of ligating the femoral would add to instead of detracting from the perils already due to the wounded joint, the fact, as it was understood, that the severely wounded whom the Army of the Potomac was obliged to leave at Savage's were conveyed to Richmond, a distance of about fifteen miles, over rough roads, and the unfortunate condition of that city as to temperature, supplies, and general accommodations, precluded, in my mind, the possibility of this officer surviving the double injury, as we were tempted to call it. Accordingly, in writing to his friends at the north, he was reported as having probably died of his wounds in the hands of the enemy; for, at that time, there was no exchange of prisoners. Between three and four weeks after the battle, however, an exchange or release on parole of the wounded was negotiated, and, with the first boat load from Richmond that passed Harrison's Landing, I was sent north for a few days. To my great surprise, on this boat I found my friend, greatly emaciated and suffering; but the ligature had come away successfully, and the primary violence of the joint inflammation was fairly overcome. At that time, although both wounds were suppurating, the incision over the artery gave quite as much apparent trouble as the original injury. His general strength was much prostrated and he appeared to be in a condition of hectic irritation. He was carried to Baltimore, and I saw no more of him until the following December, when, on being ordered out of the field, it so happened that I was for a time placed in charge of sick and wounded officers in that city. At this date his general health was good, the wound in the knee had healed, the incision in the thigh, singularly, had not entirely cicatrized, and, which was of the most inconvenience, the leg was partly flexed upon the thigh and was fixed by false anchylosis. This condition must be attributed to the position that the limb had naturally assumed under the influence of whatever inflammation had occurred at the time of the severest suffering, and which his medical attendant had neglected or feared to alter while the healing was in progress lest the inflammation might be again excited. Fortunately there was no torsion, whence it may be inferred that the morbid action was not severe. In a week or two he passed from under my charge to that of Surgeon Thomas P. Gibbons, U. S. V., but I saw him frequently during the winter of 1862–63. By the repeated application of force, sometimes with the hands and

FIG. 229.—Appearance of limb 18 years after injury. [From a photograph.]

[1] The essay is only briefly adverted to on page 288 of the *Atlanta Medical and Surgical Journal*, 1874–75, Vol. XII. A manuscript copy of the lecture was forwarded to the Surgeon General's Office by its author.

[2] The case is identical with the case referred to at the meeting of the New York State Medical Society in February, 1863, by Dr. JOHN SWINBURNE (*Resection of Joints and Conservative Surgery*, in *Transactions of the Medical Society of the State of New York*, for the year 1863, Albany, 1863, p. 170, and *Medical and Surgical Reporter*, 1863, Vol. IX, p. 401): "A captain in the Regular Army was wounded by a ball passing through the knee joint. We could not ascertain to a certainty that the same was injured, as the course of the ball was directly through the centre of the joint, from side to side, so it is possible that only the cartilage was wounded. Dr. ROGERS tied the femoral artery, so as to interrupt and break the current of blood to the injured parts. When I last saw him, thirty days after the injury, there had been little inflammation, and the prospects were good for entire recovery. I have since learned that he *has* entirely recovered, with a good limb."

[3] ROGERS (DAVID L.), *A memoir on the utility of tying Large Arteries, in preventing Inflammation in wounds of the principal joints and important surgical operations, illustrated by cases*, in *New York Medical and Physical Journal*, 1824, Vol. III, p. 453.

sometimes with a screw apparatus, the adhesions were gradually broken up, and he gained a fair passive use of the joint; in the spring he was able to go on sick leave to his home in Ohio, and in the summer of 1863 was, I believe, assigned to duty as a mustering officer. He saw no more campaign service, but, while the war was still in progress (I think in 1863), joined his regiment on the Pacific coast. It is now nearly twelve years since he was shot, and it is more than eleven years since I have seen or heard directly from him; but I have seen officers who have served with him in garrison who were not aware that he had been wounded. I should suppose that he is practically a sound man, although it is probable that he cannot discharge the more fatiguing duties of the field." A letter of inquiry by the editor, in March, 1880, elicited the following response from Captain Jordan: "Recruiting Rendezvous, U. S. Army, No. 9 South Clark Street, Chicago, Illinois, April 2d, 1880. Dear Doctor: Your letter of the 29th ult. was received yesterday. In reply thereto, I would inform you as follows—viz: The ball (spherical) with which I was wounded entered just below the patella through the left side of the ligament of the same and the head of the tibia, and passed out a little below the centre of the popliteal space. The synovial sac, I think, was injured, although I did not have synovitis, as the doctors feared, but am under the impression that some synovial fluid escaped from the joint. There was profuse bleeding; so much so, that my pantaloon leg and stocking had to be cut off on account of being so stiff from the blood. I have never had any pain in the knee except when I have hurt it. There is no stiffness except after using the limb in marching or much dancing. The joint is nearly as good as the other one, although I cannot flex the wounded limb quite as much as the other one. No bone came out of or was removed from the wounded joint. The patella of the wounded limb is one inch and a half lower than the other one. The femoral artery was ligated a little over half way up from the knee, to prevent inflammation. I am not certain whether Dr. Rogers or Dr. A. K. Smith did it. Dr. Woodhull attended me in hospital in Baltimore as late as February, 1863, and saw me on the ferry boat between Oakland and San Francisco in September, 1877. A few days after I was wounded I was taken prisoner and remained so about three weeks. I was then taken to Baltimore, Maryland, where I remained in hospital until, in February, 1863, I was granted a sick leave, and was on crutches thereafter for about six months. When my wound had healed while in hospital, my limb was stiffened with the lower part of the leg at right angles to the upper part. Dr. Woodhull and another surgeon placed me under the influence of chloroform and partially removed the stiffness. I then wore an apparatus for about six months until the limb had become very nearly as straight as the other, *i. e.*, straight enough, my other leg being a little knock-kneed. * * Very respectfully, your obed't servant." (Signed.) Wm. H. Jordan, Captain, 9th Infantry. The letter was accompanied by a photograph, a copy of which is shown in Fig. 229.

Ligation of the femoral artery for secondary hæmorrhage was successfully performed in two instances of shot fracture of the head of the tibia:

Case 564.—Lieutenant Thomas W. Robertson, 79th New York, was wounded, on June 16, 1862, in the assault on the works on James Island, by a musket ball, which struck the outer side of the head of the left tibia and passed upwards and lodged, as was believed, in the intercondyloid notch of the femur, or somewhere about the knee joint. Amputation of the thigh was advised but refused by the patient. The limb was then placed in an easy position and cold-water dressings were applied. The patient was treated in the regimental hospital until June 28th, when he was sent to New York. On July 6th, there was profuse hæmorrhage from the anterior tibial artery. On July 8th, the femoral artery was tied by Professor Willard Parker. At this date the knee joint was excessively swollen, and there was free suppuration from the wound. After a very protracted confinement the patient ultimately recovered, with complete anchylosis of the knee joint, the straight position of the limb being preserved. Lieutenant Robertson was transferred to the Veteran Reserve Corps on February 29, 1864, and was on duty at Emory Hospital in 1865. On July 18, 1865, the photograph (*Surg. Phot. Series*, No. 78, A. M. M.) was taken, a copy of which is shown in Fig. I of Plate LXVIII, opposite p. 370. The facts of the case were communicated by Surgeon N. R. Moseley, U. S. V., who reported that Professor Parker and the other surgical advisers of Lieutenant Robertson entertained no doubt that the knee joint was primarily involved in this case. The exact location of the ball was never ascertained. Lieutenant Robertson was discharged and pensioned. Examining Surgeon E. Bradley, of New York, reported October 24, 1866: "Ball shattered upper third of left fibula; resection of a portion followed. The femoral artery had to be tied. Knee is anchylosed, foot atrophied, cold, paralyzed, and limb of little more use than an artificial limb." Examiner Th. F. Smith, in September, 1873, states: "Ball entered outside of upper part of left leg and has never been removed; there is a large cicatrix on the opposite side of the leg, the result of an abscess; complete anchylosis of the knee joint." Drs. J. F. Ferguson and M. K. Hogan report, September 7, 1875: "The femoral artery has been tied. The knee joint is solidly anchylosed." The Examining Board, consisting of Drs. S. S. Burt, A. B. Judson, and Wm. O. McDonald, state, September 14, 1877: "Left knee anchylosed, nearly straightened; femoral artery tied on left side." Pension paid March 3, 1880.

Case 565.—Private A. J. Scott, Co. A, 9th Maine, aged 24 years, was wounded at Deep Bottom, August 16, 1864, and admitted to hospital at Beverly six days afterwards. Assistant Surgeon C. Wagner, U. S. A., reported: "Shot wound of right leg, injuring the head of the tibia. Secondary hæmorrhage took place from the anterior tibial artery and sixteen ounces of blood was lost on December 17th, when the femoral artery was ligated in its continuity at the lower third of the thigh by Acting Assistant Surgeon J. C. Morton. Chloroform was used and the patient reacted promptly. Two weeks after the operation he had recovered." He was discharged from service June 6, 1865, and pensioned. Examiner C. E. Snow, of Calais, Maine, March 7, 1866, certified to the wound and to its being "well healed; but there is considerable lameness as yet, the weakness of the joint forbidding any continued use of the limb." Examiner E. H. Vose in his report, April 15, 1874, stated that the ball lodged and remained in the bone for four months; also that when it was extracted hæmorrhage occurred and necessitated ligation of the femoral. "Head of tibia enlarged and somewhat tender to the touch. Rheumatism from the joint downwards. Leg weak, and he cannot bear his weight upon it when at work; foot slightly extended; walks lame with a peculiar swinging gait." In the following year the same examiner described the joint as stiff; circulation feeble; considerable numbness on inner side of leg, etc., and added: "He has been under my personal observation for eight years and the disability has largely increased." The pension was paid December 4, 1879.

The series of recoveries after shot fractures of the knee joint will be concluded with three examples, in which particular bones injured were not specified:

CASE 566.—Private H. W. Pomroy, Co. F, 1st Maine Heavy Artillery, aged 36 years, was wounded at Laurel Hill, May 19, 1864, and entered Mount Pleasant Hospital, Washington, three days afterwards. Assistant Surgeon H. Allen, U. S. A., reported: "The wound was apparently through the knee joint. A conoidal ball entered at the inner border of the right patella and made its exit posteriorly at the external central part of the popliteal space, on a line with the inferior border of the condyles. The progress of the case has been imperfectly recorded. All that can be ascertained is to the effect that the patient was bed-ridden for eight weeks; that in the third week two pieces of bone were removed from the posterior wound, and in the fifth week two others were taken out; also that he suffered greatly, and according to his account had marked rigors. The patient came under my notice in January, 1865, when presenting himself for discharge. At this time the appearance of the limb was as follows: The entire extremity was rigid, the knee joint permanently anchylosed, and the region of the joint much swollen: all original contour of the outline was destroyed, and the integuments were semi-œdematous up to the hip joint. The skin was of a dead purplish red color and extremely sensitive, especially around the knee joint. The surgeons at the field hospital were desirous of amputating the limb, but the patient refused to give his consent, and the case was then treated conservatively. The patient was discharged from service January 26, 1865, and asserted, prior to his departure for his home, that should the limb continue to be so excessively painful he would have it amputated. Thus it is shown that, should conservative treatment be successful in this class of cases, the limb resultant of months of suffering is apt to be worse than useless." Examiner R. K. Jones, of Bangor, October 8, 1866, certified: "The wound is healed and he retains the power of flexing the leg slowly and feebly to an angle of 135°. He walked with crutches till the fall of 1865. He now walks with one cane, flexing the body on the left thigh and swinging with much effort the right limb forward—not flexing the knee. The foot and leg swell much after use and are now œdematous. The outside of the leg and foot are numb. He suffers much from pain after use," etc. Subsequent examiners substantially show the same disabling effects, and the Bangor Board in September, 1876, described the exit wound as very tender, and stated that a solid substance like a buckshot or a spicula of bone could be felt under the cicatrix. The pensioner was paid June 4, 1879.

FIG. 230.—Appearance of left knee joint about 2 months after injury. [From a photograph.]

CASE 567.—Allison Shutter, Drummer, Co. C, 7th Pennsylvania Reserves, received, in one of the earlier of the seven days' battles before Richmond, in June, 1862, a shell wound of the left knee joint. He was taken prisoner, and while he was in the enemy's lines it was decided that primary excision of the knee joint should be performed on the field. The operation was commenced, but was interrupted by an advance of the Union troops, who regained the ground they had lost earlier in the day. The parts were brought in apposition and the limb secured to a splint, and the patient was sent to Fort Monroe, and admitted to Hygeia Hospital on June 30th. On July 6th, he was sent to Philadelphia on the steamer Daniel Webster. He was admitted, on July 7th, to the Satterlee Hospital. The wound cicatrized and left a comparatively useful limb. This soldier was discharged February 5, 1863, by Surgeon I. I. Hayes, U. S. V., for "lameness resulting from a shell wound of the left knee." His name does not appear on the Pension List. The photograph of the patient (*Surg. Phot. Series*, No. 204, A. M. M.), represented in FIG. 230, was contributed by Surgeon R. B. Bontecou, U. S. V.

CASE 568.—Private C. Volgel, Co. F, 14th Connecticut, aged 37 years, was wounded before Petersburg, October 2, 1864, and admitted to the field hospital of the 2d division, Second Corps, where Surgeon I. Scott, 7th West Virginia, recorded: "Shot fracture of right knee." Surgeon J. C. McKee, U. S. A., reported that "the patient was admitted to Lincoln Hospital, Washington, October 8th, with shot wound of right knee joint, the ball entering antero-posteriorly, severing the capsular ligament on its internal aspect and opening the joint. When admitted, the parts were highly inflamed and synovial fluid was constantly discharging from the wound. The limb was placed in a box splint and surrounded with bran. Improvement followed the treatment. In the course of three months recovery had taken place with complete anchylosis of the joint." On June 2, 1865, the patient was discharged from service and pensioned. Examiner H. L. Burritt, of Bridgeport, Connecticut, at successive periods certified to the character of the wound and to the leg being fixed "in a nearly straight position; joint painful and whole limb swollen on motion and useless." The pensioner was paid December 4, 1879. A photograph of the injured limb, taken at Lincoln Hospital, was contributed by Surgeon McKee (*Contributed Photographs*, Vol. 3, No. 34), and is represented in the wood-cut (FIG. 231).

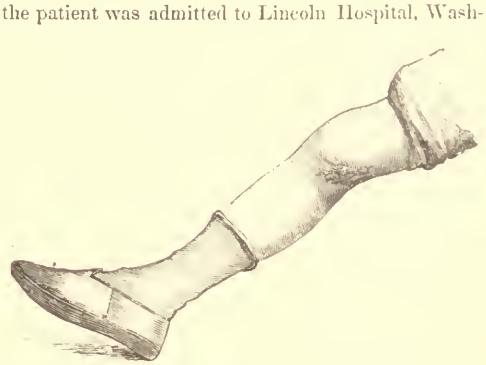

FIG. 231.—Anchylosed knee joint, about 6 months after injury. [From a photograph.]

The records in the cases of recovery after shot fracture of the bones of the knee joint treated by conservation show that of the three hundred and thirty-eight patients, fifty-nine recovered with complete, and one hundred and sixty-five with partial anchylosis; in twenty-three instances impaired motion, with lameness or weakness of the limbs, or partial

paralysis with atrophy of muscles, was indicated; in eight instances the motions of the joint were reported perfect, and in eighty-three cases the condition of the limb has not been ascertained. Thirty-two of the patients were Confederate and three hundred and six Union soldiers. Two hundred and thirty-six of the three hundred and six Union soldiers became pensioners; but twenty of them have died, since the close of the War, of phthisis and other diseases, and one has committed suicide.

Fatal Cases of Shot Fractures of the Bones of the Knee Joint treated by Conservation.—This group comprises five hundred and twenty-one cases. The graver complications were pyæmia in seventy-seven instances, tetanus in two, gangrene in seventeen, and erysipelas in eighteen instances. Forty-three of the patients were Confederate and four hundred and seventy-eight Union soldiers.

CASE 569.—Private S. Kisner, Co. E, 7th Michigan,[1] aged 29 years, was wounded on picket near Chantilly, June 19, 1863, by a carbine shot, which entered the left thigh anteriorly at about its middle, passed downward and inward, and lodged beneath the integument on the inner side of the knee joint. He was brought to Washington and admitted to Stanton Hospital six days after being wounded. On June 27th, a conical ball was readily extracted through an incision, its situation being superficial. The joint at this time was neither swollen nor tender and did not appear to be involved in any way. On July 2d, some pain and swelling was noticed for the first time, when an ice-bag was applied to the knee. Two days later the swelling had extended up the thigh, and by July 6th there was well-marked erysipelas as well as effusion in the knee joint. Tincture of iodine was applied and tincture of muriate of iron was administered; stimulants were given freely. By July 8th, the erysipelas had extended clear up to the groin. On July 12th, the discharge of pus was free, and in consequence the tension and swelling of the thigh were sensibly diminished. The patient, however, was manifestly failing. On July 18th, he was seized with diarrhœa, and death supervened in the evening. The autopsy showed that the bullet had lacerated the sartorius muscle extensively and splintered the internal condyle of the femur. The joint and the cellular tissues of the thigh were filled with dark colored and very offensive pus, and the articular surfaces of the femur and tibia were denuded of cartilage. Surgeon J. A. Lidell, U. S. V., who furnished the history, with the pathological specimen (FIG. 232) and the missile (*Specimen* 3074, *Surgical Section*, A. M. M.), remarks: "The case interested me greatly, because when the bullet was extracted there was not the slightest evidence of injury to the inner condyle, nor indeed to any other bone whatever. The bullet was located quite superficially and not in relation with the injured condyle. During the eight days which elapsed between the receipt of the wound and the extraction of the missile said bullet must have slipped away from the bone into a new position. When, therefore, on July 2d, some inflammatory trouble in the knee appeared, we thought it was not due to an injury of the bone, but that the involvement of the joint originated from the soft parts. The case also affords a good illustration of the obscurity of the symptoms and the difficulty of diagnosis which may attend a serious gunshot injury of an articulation so thinly covered with soft parts and so easy of examination from every side as the knee joint."

FIG. 232.—The bones of the left knee; the posterior portion of the internal condyle is split off. *Spec.* 1309.

CASE 570.—Private *A. Simms*, 19th Georgia, was wounded in the right knee, at Antietam, September 17, 1862, and treated at a hospital near Sharpsburg. Surgeon J. H. Rauch, U. S. V., forwarded the specimen (FIG. 233), with the following history: "This was a robust young man, 19 years old. The surgeon who first attended him could not find the ball, the external opening of the wound being about four inches below the knee joint, but was satisfied that it had passed obliquely in the direction of the knee joint. Acting Assistant Surgeon H. De Young called my attention to this case five weeks after the man was wounded. His limb was much swollen, and his constitutional symptoms such that I decided against amputation, which was proposed, and placed him on a stimulating and nourishing diet, hoping that we thus might get him into a fit condition for an operation. For a week he seemed to improve, but after this he lost his appetite, and gradually sank from exhaustion, and died on November 10, 1862. This man's life would no doubt have been saved had an immediate amputation of his limb been made." The specimen consists of the bones of the knee, with the outer condyle shattered, and shows that there has been a trivial deposit of callus, with much caries and destruction of the articular surfaces of the joint.

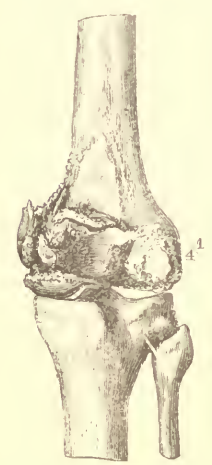

FIG. 233.—The right knee with outer condyle of femur shattered. *Spec.* 351.

CASE 571.—Private I. N. Sarvis, Co. C, 131st Pennsylvania, was wounded at Fredericksburg, December 13, 1862, and was admitted to Mount Pleasant Hospital, Washington, four days afterwards. Acting Assistant Surgeon J. C. Wyer forwarded the pathological specimen (FIG. 234) and reported the following detailed history: "Sarvis received his wound by a ball perforating the patella of the left leg, passing through the knee and making its exit at a point nearly opposite in the popliteal space. When admitted his whole constitution was suffering from the effects of the injury; the pulse quick and frequent (120), denoting irritability; the skin dry and hot; appetite poor; sensibility of the joint extreme, the patient shrieking on account of the pain occasioned by the slightest motion of the limb. The discharge from the wound consisted of synovia and

[1] A brief abstract of this case was published in *Circular* No. 6, War Department, S. G. O., Washington, 1865, p. 36.

thin unhealthy pus. There was nothing peculiar about the aspect of the limb except a general tumefaction. The tongue was furred lightly, and the expression anxious; bowels constipated. On the tenth day after admission he was attacked with a severe chill, which was followed by fever, and from this period the hectic flush began to appear upon the cheeks periodically. Subsequently there were recurrences of the rigors. Occasionally the mind wanders. The features are pinched, the skin is sallow, and countenance exhibits the icteroid appearance always present in pyæmia. There is great thirst, and the respiration is quick and irregular. On December 28th, he was attacked with a cough, the expectoration being tough, gelatinous, and streaked with blood. Auscultation revealed crepitant and sibilant rales through both lungs. On the 5th of January, 1863, Surgeon J. H. Brinton, U. S. V., visited the hospital and his attention was called to the case. At this period the case was one of well-marked pyæmia; the lung complication Dr. Brinton pronounced as multiple or metastatic abscess. 6th, no abatement in any of the symptoms. 7th, rales and rhonchi still audible through the lungs; pulse continues 120 beats in the minute; skin dry and hot; tongue dry and fissured; appetite much impaired; patient lies drowsy and dull most of the time. The discharge from the knee is profuse, ichorous, and of a sickening odor. From the 8th to 13th the symptoms have continued the same: respiration quick, pulse 130; tongue dry and crusty; discharge from the knee ichorous and extremely offensive; expectoration rusty and gelatinous. Has had slight rigors. Rales and rhonchi still present. Complains of pain on the least motion of his body. Urine scanty and turbid; bowels constipated; loss of appetite. Continues in a semi-comatose, dull condition. 14th: This morning he is unable to protrude his tongue; the features are pinched and sunken; pulse very feeble and rapid; deep hectic flush. Evening: has been moaning all day and refused his stimulants. The peculiar odor is very evident. Died at 4.30 A. M. on January 15, 1863. Autopsy eight hours after death: Rigor mortis was still present; emaciation extreme. The thorax being laid open revealed the superior lobes of the lungs apparently healthy, but upon removing them the inferior lobes were found to be consolidated and studded with abscesses varying in size from a pea to larger ones, the diameter of which measured about half an inch. The consolidation and effusion extended also to the dependent portions of the superior lobes. There was considerable effusion in the left pleural cavity. The heart was perfectly normal; no deposit upon the valves. A small clot was discovered in the right ventricle; there was also some of the separated fibrin; no effusion in the pericardium. The inferior lobes of both lungs sank readily in water. On making the incision to resect the knee joint, pus escaped from beneath the muscles of the lower third of the thigh. There was a good deal of disintegration of the tissues. The extremities of the femur and tibia were entirely separated, the crucial ligaments having been destroyed by the ball in its passage through the joint and the capsule ulcerated through at several points. The patella was perforated about its centre, dividing it into several fragments, which, however, were retained in position by the ligamentum patellæ. The internal condyle of the femur was crumbled into small fragments, and a deep furrow marked the course of the ball." In addition Dr. Wyer remarks that "at no period since his admission has an operation been admissible," also that the patient had likewise a wound of the right shoulder, involving the joint. The specimen consists of the bones of the injured knee.

FIG. 234.—Bones of the left knee. Patella and condyles of femur perforated. *Spec.* 700.

CASE 572.—Private E. Overman, Co. H, 1st Ohio Cavalry, received a shot wound of the right knee joint, at Mission Ridge, October 24, 1863. Surgeon I. Moses, U. S. V., contributed the pathological specimen (*Cat. Surg. Sect.*, 1866, p. 352, *Spec.* 2137), with the following history: "A ball entered the external condyle of the femur, penetrating the joint and lodging in the cancellated structure. He was taken to hospital in Chattanooga, where the missile was extracted, and where he remained for nearly two months. On December 20th, I saw him for the first time in hospital at Murfreesboro', to which place he had been removed by railroad, a distance of a hundred miles. The knee was very much swollen, the joint and surrounding tissues infiltrated with pus, and there was general prostration of vital force. Incisions were freely made to evacuate pus, and the symptoms generally improved. But on January 10, 1864, the patient was attacked with vomiting and prostration, and the left leg as far as the knee became gangrenous. He died on the following day." The specimen comprises the bones of the injured knee joint and shows the articulating surfaces to be completely destroyed by suppurative action.

CASE 573.—Private W. J. Lowry, Co. E, 25th Ohio, was wounded at Bull Run, August 30, 1862, and admitted to hospital at Alexandria several days afterwards. Surgeon E. Bentley, U. S. V., reported: "A minié ball passed through the right thigh antero-posteriorly, terribly shattering the lower third of the femur, opening the knee joint, and driving fragments of bone into it. The wounded man laid exposed on the battle field for two days and was then removed in an army wagon. He was treated by rest and stimulants. The patient died from pyæmia and exhaustion October 3, 1862, not having been in condition for an operation at any time before his death."

In a case of grapeshot wound of the left knee an abscess was found, at the *post-mortem* examination, which extended from two inches below the greater trochanter to a point two inches below the articular surface of the tibia:

CASE 574.—Private T. J. Barnett, Co. I, 40th Illinois, aged 24 years, was wounded at Mission Ridge, November 25, 1863, and admitted to the field hospital of the 4th division, Fifteenth Corps. Surgeon W. W. Bridge, 46th Ohio, described the injury as "a severe grapeshot wound of the left knee joint," and reported that the patient was transferred to the General Field Hospital at Chattanooga, December 20th. Acting Assistant Surgeon C. E. Ball communicated the result of the case from the latter hospital as follows: "When admitted the patient was very much emaciated, his injured knee and leg being badly swollen and the knee very painful on the slightest touch or movement; pulse 110. About a pint of pus, thin, very fetid, and of greyish color, was discharged daily. The wound ceasing to suppurate sufficiently, I made an incision just above, and by keeping the whole extent of the leg bandaged reduced the swelling in a few days. The discharge of pus, however, continued the same in amount and character. The patient was kept on nourishing diet, tonics, stimulants, and anodynes the whole time he was in hospital; but he gradually grew weaker, and died January 14, 1864. The autopsy disclosed a large sloughing wound on the

anterior surface of the knee joint; the patella fractured in four fragments. On laying open the thigh an abscess was found extending from two inches below the great trochanter to a point two inches below the articular face of the tibia, containing ichorous pus with masses of cheesy appearance and consistence. The knee joint was opened posteriorly as well as anteriorly, and the ligaments and cartilages were somewhat softened. A portion of the articular surface of the tibia was laid bare; the limb generally infiltrated with serum." The lowest third of the femur of the wounded limb, being also injured, was forwarded to the Museum by Dr. Ball, and constitutes specimen 2168 of the Surgical Section, showing a longitudinal fissure to the extent of four inches on the posterior surface of the shaft, the articulating surface being destroyed by suppuration.

FIG. 235.—The bones of the right knee, with the inner condyle and the head of the tibia fractured posteriorly. *Spec.* 983.

CASE 575.—Private W. J. D. Parks, Co. H, 132d Pennsylvania, was wounded at Fredericksburg, December 13, 1862, and entered the Harewood Hospital, Washington, on December 18th. Surgeon T. Antisell, U. S. V., recorded as follows: "Gunshot wound in right knee, opening the joint. Ball entered on the inner side of the patella on a level with it, and emerged at the popliteal space. Patient in general poor health and anæmic. Cold-water dressings were used December 22d; irritative fever; tongue dry; pulse 100. He continued to decline, there being no time at which he could bear an operation. He died on December 28, 1862. *Post-mortem:* Inner condyle of femur fractured. Ball passed directly into the joint, cutting a part of the crucial ligament and emerging from below into the popliteal space. Suppuration and burrowing of pus existed on outer side of thigh, extending four inches above the joint." The bones of the injured knee are shown in the annexed cut (FIG. 235). The specimen was contributed by Acting Assistant Surgeon W. A. Harvey, and shows that, besides the injury to the inner condyle of the femur, the head of the tibia was fractured posteriorly.

CASE 576.—Private J. Traverse, Co. I, 7th Michigan, aged 26 years, was wounded at Antietam, September 17, 1862, and admitted to hospital No. 1, Frederick, twelve days afterwards. Acting Assistant Surgeon R. Davies furnished the following minutes of the case: "Wound in the left knee by a bullet. No inflammation followed. The missile was first perceived October 27th, being situated at the outside of the patella, two inches from the tubercle of the tibia and directly under the integument. On extracting it about half a dozen drops of synovia escaped, the joint being opened to a very small extent by the edge of the base of the bullet. Wound closed by plaster. October 29th, inflammation of the joint having set in, cupping to the amount of six ounces was resorted to; ice applications and opiates; low diet. October 30th, measurements around the left or affected knee show, above the patella, thirteen and a half inches; across the patella, fourteen and three-quarter inches; and below the patella, eleven and a half inches; while at the right or sound knee they show thirteen, fourteen, and eleven inches respectively. November 4th, patient had a sleepless night and pain, notwithstanding a dose of morphia. There is an opening on the outer side of the patella, from which pus is freely escaping. The injured knee now measures fourteen inches above, sixteen and a half inches across, and thirteen and a half inches below the patella. 13th, measurement shows fourteen, fifteen, and thirteen inches above, across, and below the patella. Two openings have been made on the inner side, one opposite the upper border of the patella and the other four inches above. Pus of a healthy character exudes. Complains of much startling pain at times, in the intervals is not in much pain; pulse 100. 14th, there was a chill, and again the next day. 16th, another chill. Burrowing of pus on the inside of the thigh. Discharge thin in quality, like dirty greenish water. The slightest pressure above and below the patella, especially on the inner side, induces an immediate escape of pus. No pain or redness in course of the saphena vein. Has hiccough; skin hot; pulse 120. 20th, discharge as thin and watery as possible, emerging upon the slightest pressure at any part of the thigh; surface of body and extremities bathed with perspiration; pulse too fast to be counted. Patient evidently sinking. Died on November 21, 1862. *Post-mortem:* A collection of partially fluid dark blood was found in the thigh, corresponding to the attachments of the inner and outer layers of the fascia. The periosteum was easily detached over the lower two-thirds of the femur, on the anterior, interior, and external portions; bone laid bare for about the size of a sixpence at the lower portion of the femur. The articular surface of the femur was entirely bare, as was also its anterior and lateral borders. The borders and the articular surface of the head of the tibia were bare and the bone roughened, and there was fracture and bony separation of the patella into three portions. There was a sequestrum about the size of a nut on the left side of the tubercle of the tibia." The bones of the knee were contributed to the Museum by Acting Assistant Surgeon Davies, and are represented in the annexed wood-cut (FIG. 236).

FIG. 236.—The bones of the left knee; the patella is fractured and the head of the tibia involved. *Spec.* 753.

CASE 577.—Private *W. West*, Co. C, 51st Georgia, aged 17 years, was wounded at South Mountain, September 14, 1862, and admitted to hospital at Frederick three days afterwards. Acting Assistant Surgeon W. W. Keen, jr., reported: "Gunshot wound of left knee joint, a ball passing through the head of the tibia, involving the joint. There was also a flesh wound of the right leg just below the knee joint. Irritative fever ensued and continued for one week after the patient's admission. The treatment was supporting and poultices were applied to the joint, which improved in external appearance. Pieces of the articular surface of the tibia were nearly detached on September 25th. Two days later suppuration was free and of a flocculent character; tongue dry and furred; pulse 116. On October 4th, the joint was laid open by free incisions on each side of the patella, when the pus was found to be burrowing up the thigh to a very great extent. On October 8th, the condition of the thigh was apparently improved, but the pulse was no better and the patient had a severe chill. He continued to grow weaker. On October 13th, there was some hæmorrhage from the wound, and on the following day the patient died. At the *post-mortem* examination a broad abscess was discovered to extend from the knee to the groin. The ball was found to have passed directly through the joint from side to side, knocking off pieces of the internal condyle of the femur and the articular surface of the tibia. This patient had been told at an early stage of the treatment that his limb ought to be amputated. But he expressed his certainty of recovering without amputation and begged off, declaring his readiness and willingness to incur all risks of that

course. He was therefore not operated upon." The bones of the injured knee joint, showing the articular surfaces to be eroded, were contributed to the Museum by Acting Assistant Surgeon J. H. Bartholf, and constitute specimen 825 of the Surgical Section.

CASE 578.—Private *J. W. Skettles*, 2d Mississippi, was wounded at Antietam, September 17, 1862, and admitted to a hospital near Sharpsburg. Surgeon J. H. Rauch, U. S. V., contributed the specimen represented in the annexed wood-cut (FIG. 237), and reported: "This man was wounded through the knee joint, from the effects of which he died on November 9, 1862. Had this man been operated upon, I am satisfied his life would have been saved." The specimen consists of the bones of the left knee with the inner tuberosity of the tibia perforated obliquely downward by a round ball. The articular surface is eroded by suppuration. The bullet is seen at the point of entrance, whither it appears to have gravitated through its own track and where the fragments are necrosed. The partial fracture of the shaft of the tibia has been slightly consolidated by effusion of callus.

FIG. 237.—Shot perforation of inner tuberosity of the left tibia. *Spec.* 356.

CASE 579.—Private P. Gregory, Co. H, 1st Delaware, was wounded in the right knee, at Antietam, September 17, 1862. Surgeon I. Scott, 7th West Virginia, noted his admission to the field hospital of the 3d division, Second Corps, with "wound of leg." On September 27th, the wounded man was transferred to hospital No. 1, Frederick, where he died October 16, 1862. The specimen, shown in the cut (FIG. 238), was preserved at the *post-mortem* examination and contributed to the Museum by Acting Assistant Surgeon W. W. Keen, jr. It consists of the upper portion of the bones of the leg, with the head of the tibia shattered by a ball passing through it transversely. The fragments are necrosed.

FIG. 238.—Shot comminution of head of right tibia. *Spec.* 760.

CASE 580.—Private J. McNulty, Co. E, 22d Michigan, was wounded in both knees, at Chickamauga, September 19, 1863, and admitted to hospital at Chattanooga some days afterwards. Surgeon J. T. Woods, 99th Ohio, reported: "Fracture of head of each tibia; patient suffering from chronic diarrhœa; simple treatment. Hæmorrhage occurred; popliteal artery and branch, with popliteal vein, ligated. Gangrene set in below the location of the ligatures, and death supervened October 15, 1862."

CASE 581.—Sergeant J. McCarthy, Co. C, 149th New York, was wounded at Wauhatchie, October 27, 1863, and admitted to the field hospital of the 1st division, Fourteenth Corps. Surgeon W. M. Wright, 79th Pennsylvania, reported: "He was wounded by a conical leaden bullet, which entered on the posterior aspect of the right leg about four inches below the knee, taking an upward course, and passing out just one inch beneath the patella. The wound was probed by a competent surgeon, who concluded that it was not a case warranting amputation, although in the end it might prove to have been judicious. Two or three days afterwards the patient complained of severe pain in the knee which required large doses of anodyne to alleviate. The pus assumed a thin watery consistence of a brownish coffee-like appearance and discharged quite freely; odor somewhat unpleasant though not fetid. The limb was greatly increased in size throughout its whole extent, and to the touch it gave evidence of œdema. Several days later pressure upon the knee gave a crackling sensation to the hand, giving unmistakable evidence that the joint was implicated. The patient died on the morning of November 8, 1863, after extreme suffering during the previous twenty-four hours. During the period succeeding the first three days there was great gastric irritability which remedies failed to correct. During the last two days the discharges from his bowels were black, and for twelve hours previous to death a black substance, resembling thin coffee grounds somewhat and amounting to a pint probably, was discharged from the mouth. An examination of the limb after death showed a fracture of the head of the tibia behind, external to the popliteal notch, extending into the articulating surface from an inch and a half below it. Necrosis of the bone had commenced to a slight degree. The femur and fibula were untouched."

FIG. 239.—Destruction of left knee by a shell explosion. *Spec.* 709.

CASE 582.—Private B. Madden,[1] Co. A, 28th Massachusetts, was wounded at Fredericksburg, December 14, 1862, by a shell in the left knee joint. He was admitted to Douglas Hospital, Washington, twelve days afterwards. Medical Cadet S. T. Kingston, U. S. A., contributed the pathological specimen, represented in the annexed wood-cut (FIG. 239), and reported that "the patient died December 29, 1862, from the effects of a shell wound in the left knee." The specimen consists of a ligamentous preparation of the injured knee, showing fearful laceration and complete destruction by the missile, two fragments of which are mounted with the preparation.

CASE 583.—Private F. L. Mellott, Co. K, 12th Pennsylvania Reserves, was wounded at South Mountain, September 14, 1862. Acting Assistant Surgeon G. W. Corey reported: "He was wounded by a musket ball entering the left knee near the lower border of the patella, a little to the outer side of the ligamentum patella, passing obliquely backward and outward through the outer tuberosity of the tibia and through the head of the fibula. The man was brought to the temporary hospital at Middletown some time in the night following the battle, and the second day after the injury the femoral artery of the wounded limb was tied by the Surgeon in charge for the purpose of keeping down the inflammation and saving the limb. Water dressings were applied and stimulants and anodynes freely administered. About six days after the battle the hospital was permanently established and the patient came under my care. At this time I found him suffering from severe pain, the redness and swelling

[1] This case has been alluded to and the specimen figured in *Circular* No. 6, War Department, S. G. O., Washington, 1865, pp. 37, 38, FIG. 50.

of the joint being moderate, suppuration profuse, and the temperature of the parts below as I expected to find it. In fact so marked was this latter symptom that I feared the occurrence of gangrene of the part and immediately discontinued the water dressing. Gangrene, however, did not set in; but the soft tissues, wherever the limb rested on the pillow, sloughed very rapidly, indicating the low vitality of the parts. The treatment from this time consisted of emollient applications and stimulant and astringent lotions, with a free use of alcoholic stimulants internally. The case went on for some time without any marked change, the discharge becoming more profuse and the sloughs extending and presenting no disposition to granulate. Finally diarrhœa, loss of appetite, night-sweats and delirium supervened, and death resulted on October 28, 1862,—forty-three days after the reception of the injury. An examination of the joint after death showed the most perfect destruction of the synovial membrane and of the articular cartilages and other soft tissues." The bones of the fractured knee joint were contributed to the Museum by Dr. Corey, and constitute specimen 915 of the Surgical Section. The specimen shows the condyles to be split vertically, the inner one being broken posteriorly and nearly detached, and the articular space eroded by suppuration. The fractured extremities of the tibia and fibula are thoroughly carious.

Four hundred and seventy-eight of the five hundred and twenty-one fatal cases of shot fractures of the knee joint treated by conservation were Union and forty-three were Confederate soldiers. Specimens illustrating the nature of the various injuries of the bones of the knee are preserved in the Army Medical Museum in ninety-nine cases.

The side of the injury was reported in seven hundred and ninety-seven of the eight hundred and sixty-eight cases of shot fractures of the knee joint. The right side was involved in four hundred and thirty-one, the left in three hundred and sixty-six. Of the former, one hundred and seventy-four were successful, two hundred and fifty-four were fatal, and three undetermined, giving a mortality rate of 59.3 per cent.; of the latter, one hundred and fifty-two were successful, two hundred and thirteen fatal, and one undetermined—a mortality rate of 58.3 per cent., or 1 per cent. in favor of the injuries of the left side. Of eight hundred and sixty-eight patients, seven hundred and eighty-seven were Union soldiers. Three hundred and six recovered; four hundred and seventy-eight proved fatal, and in three cases the result was not ascertained—a fatality of 60.9 per cent. Of eighty-one Confederate soldiers, thirty-two recovered, forty-three died, and six cases were undetermined—a mortality of 57.3 per cent., or 3.6 per cent. less than the percentage of deaths among the Union soldiers. In forty-four instances, with twenty-four recoveries and twenty deaths, fragments of the patella or of the articulating ends of the femur or tibia were removed.

EXCISIONS AT THE KNEE JOINT FOR SHOT INJURY.—As far as the records of this Office indicate, fifty-seven excisions at the knee joint for shot injury were performed during the American civil war, the first operation having been done on September 15, 1862, at the Fairfax Seminary Hospital, near Alexandria, Virginia. It is to be regretted that the name of the operator in this instance is not reported. Prior to that time there were recorded eighteen examples of this operation for shot injury,—fifteen in Europe,[1] and

[1] Excision of the patella for shot fracture is mentioned by J. CH. A. THEDEN (*Neue Bemerkungen und Erfahrungen zur Bereicherung der Wundarzneykunst*, Berlin und Stettin, 1782, B. I, p. 101): "I cannot, therefore, approve of the excision of the patella fractured by shot, which I have seen undertaken by somebody but very unfortunately, as gangrene and death supervened." No particulars are recorded. KAJETAN V. TEXTOR (LUDWIG FUCHS, *Ueber Resection im Kniegelenke*, Inaug. Diss., Würzburg, 1854, p. 9, No. 13) resected, on November 4, 1847, the fractured condyles of the femur of a laborer, aged 37, shot in the left knee while poaching; death from pyæmia, November 11, 1847. KNORRE, of Hamburg (L. STROMEYER, *Maximen der Kriegschirurgie*, Hannover, 1861, p. 522, *note*, and GURLT (E.), *Die Gelenk-Resectionen nach Schussverletzungen*, Berlin, 1879, p. 1189), resected the joint in the case of Carl Kunseh, aged 21, wounded August 13, 1849; missile entered the upper part of the right leg, at the inner side of the crest of the tibia, and emerged at the same height posteriorly; inner half of upper portion of tibia shattered. On August 15th, decapitation of tibia and fibula, sawing off 2½ inches of each. By November 1st, firm union between femur and leg. Left hospital in June, 1850. Seen by the operator in the summer of 1859, carrying a heavy basket, entirely well, and, with the exception of stiffness, not suffering from any inconvenience from the leg. On January 17, 1875, the operator reports the patient as having a blooming complexion, being well fed, and having maintained his family without assistance. He was able to carry 150 pounds; for the past two years the strength of the leg has diminished, compelling him to earn his bread as a night-watchman. He was able to walk two or three miles (German) a day without tiring. He has continuously used a linen bandage two inches wide and four yards long to support the leg since leaving hospital. Cicatrix sound, pale, and movable. The limb is 6 centimetres shortened. FAHLE (F. ESMARCH, *Ueber Resectionen nach Schusswunden*, Kiel, 1851, p. 133) operated in the case of Philip Blumenthal, volunteer, 2d Chasseur Corps, 2d Co., wounded in a reconnoissance, December 31, 1850, a ball entering the outer side of the left knee. On January 3, 1851, by Dr. STROMEYER'S advice, the patella, 1½ inches of the condyles of the femur, and portions of the tuberosities of the tibia were excised; death February 3, 1851. J. H. LAKIN (T. P. MATTHEW, *Med. and Surg. Hist. of the British Army which served in Turkey and the Crimea*, London, 1858, Vol. II, p. 379, and GURLT (E., *loc. cit.*, p. 126): Case of H. Gribbins, 77th British Regiment, aged 19, wounded Sept. 8, 1855, during the retreat from the Redan, in the left knee; Sept. 30, 1855, excision of about 1¾ inches of the condyles of the femur and

three on this continent.[1] Eight of the operations had been successful, nine fatal, and in one instance the result had not been ascertained. The results of the fifty-seven cases of excision of the knee joint of the American civil war are indicated in the following table:

TABLE LIII.

Classified Statement of Fifty-seven Cases of Excisions at the Knee Joint for Shot Fracture.

In three instances the terminations were not ascertained; ten operations were followed by recovery and forty-four by death, a fatality of 81.4 per cent. As indicated in TABLE

a thin slice of the head of the tibia; patella removed; death Oct. 28, 1855. JOHN BROWN, Assistant Surgeon Bengal Medical Service (*Edinburgh Med. Jour.*, 1860, Vol. VI, p. 320): Case of Mahun Singh, aged 30, wounded Jan. 16, 1858, in an attack on the English at Alumbaugh. Wound over the left knee; limb severed and hanging by a shred of skin; also compound fracture of patella of right knee. Left femur immediately amputated at middle third, and right knee resected by an H-incision; no hæmorrhage, no anæsthetic used; death on the evening of Jan. 17, 1858, from the effects of shock. J. NEUDÖRFER (*Handbuch der Kriegschirurgie und der Operationslehre*, Leipzig, 1872, Zweite Hälfte, p. 1545 *et seq.*) gives details of six operations performed by himself: Johann Zelenka, Austrian Infantry Regiment E. II. Rainer, wounded at Solferino June 24, 1859. Shot fracture of left hand, causing amputation of index and middle fingers, and shot wound of thoracic parietes, and a shot fracture of the left knee joint. November 20, 1859, resection of about 2½ inches of the end of the femur, a thin slice of the head of the tibia, and part of the patella. Wound healed in three months, leaving several fistulas. He could bend the joint to an angle of from 5 to 8 degrees. Johann Dubon, Prince Hohenlohe Austrian Infantry Regiment. Shot fracture of the right knee joint. September 8, 1859, secondary operation, by reason of progressive caries; death September 24, 1859. Michael Fonta, 5th Austrian Infantry Regiment. Wounded at Solferino June 24, 1859. Shot fracture left knee joint. Resection February 10, 1860; death from exhaustion February 28, 1860. Abraham Maksa, Prince Wasa Austrian Infantry, 3d Co., wounded at Solferino June 24, 1859, in the right knee joint. Resected February 11, 1860. Complete recovery. Antonio Mazzini; shot fracture of right knee joint. Resection March 20, 1860, of condyles of femur (about nine months after injury), in hospital at Verona. Sent home six weeks after the operation in a fair way of recovery. Not heard of afterwards. Anton Potesch, Austrian Infantry Regiment "Kaiser." Wounded in right knee joint. Resection May 18, 1860 (about a year after injury); death from pyæmia May 22, 1860. D. W. CROMPTON, of Birmingham (*Medical Times and Gazette*, 1861, Vol. I, p. 518): George W., aged 19, wound in left knee joint by accidental discharge of gun, December 26, 1860. Admitted the same day into Birmingham General Hospital. Resection of the joint, sawing off a thin portion of the head of the tibia and corresponding thin portion of the condyles, after which nearly the entire shattered condyle of the femur was sawn off diagonally, and numerous shot were removed. The patella, as well as the articular cartilage of the parts not resected, was left intact. April 5, 1861, discharged from hospital cured. Could walk with ease with the aid of a cane. Limb from ½ to ¾ inch shortened. HUTCHINSON, of London (*Lancet*, 1861, Vol. I, p. 386): A healthy young man, who had been severely wounded February 13, 1861, in both legs, at a distance of twelve paces, by the accidental discharge of a gun loaded with No. 6 shot and a pasteboard stopper. The charge penetrated just over the right knee, going diagonally downward through the condyles of the femur, and entering the inner side of the left leg below the knee and behind the inner margin of the tibia, lodging superficially on the outer side of the left leg. Admitted into London Hospital February 13, 1861. Resection an hour after injury, removing about an inch and a half of the femur, a very thin slice of the tibia, and extirpating the entirely intact patella; death February 23, 1861, of tetanus. HENRY SMITH (*Medical Times and Gazette*, 1863, Vol. II, p. 376): John H., aged 29, private, English Fusileer Guard, wounded at the battle of Inkerman, November 10, 1854, in the left knee joint. Ball lodged in popliteal space and extracted in hospital at Scutari. Resection September 6, 1862, at King's College Hospital, London. Discharged from hospital December 9, 1862, cured. The cases of LARREY, PERCY and LAURENT, and CHAMPION, cited by OSCAR HEYFELDER (*Lehrbuch der Resectionen*, Wien, 1863, p. 135) and by H. CULBERTSON (*Excision of the Larger Joints*, Prize Essay, Philadelphia, 1876, p. 188, in *Trans. Am. Med. Assoc.*, Supplement to Vol. XXVII), have been omitted. In LARREY'S case (D. J. LARREY, *Mém. de Chir. Mil. et Camp.*, Paris, 1812, T. III, p. 256) of an Arab, named Ibraham, only loose fragments of the patella were removed. The cases ascribed to PERCY and LAURENT are evidently the operations referred to by them in their article *Resection*, in *Dict. des Sci. Méd.*, Paris, 1820, T. XLVII, p. 555: the operations were for disease of the knee joint and were performed by MOREAU. In the operation ascribed to CHAMPION, which is found in his *Traité de la Resection des os caries dans leur continuité, ou hors les articulations*, Paris, 1815, No. II, p. 77, carious bone was chiseled away from the tibia to allow the removal of the ball.

[1] GURDON BUCK (*Excision of the Knee Joint for Anchylosis*, in *New York Med. Times*, March, 1854, Vol. III, p. 205): Gunshot wound of knee joint, received about April 20, 1853; healed with anchylosis at an angle of about 135 degrees upon the thigh. August 9, 1853, adhesions broken up; a slice removed from the inferior surface of the condyles of the femur, including the pulley-like surface intervening between, and the articular surface of the tibia on a level with the upper extremity of the fibula; coaptation of cut surfaces, which were held together by a wire; the wound healed in nine weeks. Dr. BUCK exhibited the patient to the New York Academy of Medicine, February 1, 1854. E. S. COOPER (*Case of Exsection of the Knee Joint in consequence of Disease of Bones caused by a gunshot wound*, in *The Cleveland Medical Gazette*, 1861, Vol. III, p. 604): N. F., aged 24, shot through the

LII, page 367, the articulation was primarily involved in fifty-six instances; in the remaining case the operation was performed for shot fracture of the upper thirds of the bones of the leg.

Primary Excisions at the Knee Joint.—In thirty-two of the fifty-seven cases of excision of the knee joint performed during the American civil war the operation was done within forty-eight hours after the reception of the injury. The results in two of the thirty-two cases could not be ascertained; four of the patients survived the operation, and in twenty-six instances death resulted, a mortality rate of 86.6 per cent.

Recoveries after Primary Excision of the Knee Joint.—Portions of the condyles of the femur and the head of the tibia were removed in three of the four cases of this group; in the remaining case the extremity of the tibia and the patella were excised. Three operations involved the right limb and one the left. Two were Confederates and two Union soldiers. In one of the four instances amputation of the thigh became necessary on the fifth day, and, although the patient survived both operations, the case cannot well be cited as an instance of recovery after primary excision at the knee joint:

CASE 584.—Surgeon A. W. Bailey, 1st South Carolina Infantry, of Barnwell District, reports[1] the following remarkable example of successful partial excision of the right knee: "Lieutenant *J. W. Harlee*, Co. I, 1st South Carolina Regiment, Bratton's Brigade, aged about 27 years, and of robust constitution, was wounded in the battle of the Wilderness, May 6, 1864. A minié ball passed laterally through the right knee joint, fracturing the head of the tibia. A curved incision was made, extending from one condyle to the other, reaching just below the inferior border of the patella. All the ligaments, with the synovial sac, were divided, and the semilunar cartilages removed. A transverse section of the head of the tibia, embracing the fractured portion, was made above the articulation with the fibula. The patella was not ablated. The wound was closed with sutures and adhesive straps, and the limb secured to a long outside splint. The next day he was transported about twenty-five miles over a rough road to the rear, and two of the sutures cut out, thereby exposing the internal condyle. In a short time the exposed surface was covered with healthy granulations and the space soon filled up. In the course of six or eight weeks true anchylosis had taken place, and the wound healed, except a small place where the condyle was exposed, leaving a small fistula, which healed in a short time afterwards. This officer, who returned to his command to be retired on the Invalid Corps, gives the following account of the treatment carried out after being sent to the General Hospital: He was furnished with a quart of good whiskey daily, and requested to drink as much as he could, and use the balance on his leg. He says he drank the quarter portion each day, and dressed his wound twice daily with one part of whiskey to three of water. His leg is about three inches shorter than the other; he wears a high heel and thick sole to his boot, by which means he is enabled to walk without crutches, and even dance with ease."

CASE 585.—Private *W. F. Jackson*, Co. G, 6th South Carolina, aged 21 years, received a shot fracture of the left knee joint, near Richmond, October 7, 1864. He underwent the operation of excision on the day of the injury, at the hands of Surgeon Stony, C. S. A., who removed the condyles of the femur and the detached fragments of the patella through a straight incision in the line of the wound. Fragments of bone continued to discharge for about twelve months after the operation, after which time the wound remained perfectly healed. The case was reported by Dr. C. H. Ladd, late Surgeon 56th North Carolina, who stated that when last heard from, in December, 1872, the man had very limited motion of the injured joint. The records of Jackson Hospital (Confederate), Richmond, show that the patient was admitted with "shot wound of knee joint, treated by ablation of patella," and that he was furloughed March 13, 1865. In a letter, written and forwarded in 1868, the man represented his wounded limb—which, in the opinion of all who examined it, had undergone "one of the most remarkable surgical operations"—as "a good sound leg, which answers every purpose."

CASE 586.—Private A. Rider, Co. G, 76th Pennsylvania, aged 25 years, was wounded in the right knee, at Pocotaligo, October 22, 1862, and admitted to hospital No. 1, Beaufort, two days afterwards. Surgeon R. B. Bontecou, U. S. V., contributed the pathological specimen (FIG. 240) and the following report: "The missile was a rough leaden canister ball of ordinary size, which entered the limb over the front of the external condyle, passing through the posterior margin of it, opening the capsule and lodging in the popliteal space. The circulation and appearance of the limb was good, but there was some swelling of the knee and pain on motion or to the touch. The bullet was removed from beneath the integuments by incision on the morning of his admission. Resection of the lower portion of the condyles of the femur was done the same day, at 3 P. M., and the semilunar cartilages removed from the tibia. The H-incision was employed, and the transverse cut united by lead wire accurately. Morphia was applied to the wound, and wet lint and the ice bag kept constantly in use. On the next day, the patient's bowels not having

knee joint, in June, 1857; fracture of condyle of femur and upper part of tibia. October 25, 1857, excision of condyles of femur, of more than an inch of the head of the tibia, and of the patella; complete recovery. CHARLES A. POPE (*Complete Osseous Anchylosis of the Knee Joint. Successfully operated on by Barton's method*, in *Am. Jour. Med. Sci.*, 1861, Vol. XLII, p. 298, and *St. Louis Med. and Surg. Journal*, May, 1861, Vol. XIX, p. 211): Mr. A., a healthy man, aged 40, received, when about 10 years old, an accidental shot wound of the knee, the ball passing just below the right knee joint. The articulation became secondarily involved and complete osseous anchylosis resulted. For long years he wore a wooden peg with the knee resting in a socket at its upper extremity, for purposes of locomotion. March 14, 1861, resection of knee by Dr. POPE, assisted by Drs. SMITH, GREGORY, and DEWEY. Recovery; walks without a stick ordinarily.

LIBRARY
OF THE
UNIVERSITY
CALIFORNIA.

been moved for some days, an ounce of sulphate of magnesia was administered. October 30th, diarrhœa having been troublesome for twenty-four hours, pills of argentum, opium, and camphor were given, and on the following day, the diarrhœa still continuing and there being some febrile symptoms, spirits of mindererus was prescribed and milk porridge for diet. Wet dressings with ice were continued until November 2d, when cerate dressings and dry lint with ice bag were ordered. Starch and laudanum injections arrested the looseness. The limb had been kept on a pillow, and great pain was experienced on the slightest movement until I constructed a rest for it out of two parallel cushions of hay tacked on a plank, leaving a space under the knee unstuffed. When laid on this, on October 27th, the limb was very comfortable. Before that time the poor fellow had frequently regretted that it was not removed. The transverse incision healed without suppuration, and no swelling of the limb, above or below the knee, took place. The only ligature employed was on the azigos artery, which came away November 16th. Scarcely any inflammation about the knee took place until November 18th, when I observed that the line of incision, which had healed many days ago, reopened in places and discharged pus. Cerate dressings were applied and straps to approximate the lateral wound; the limb exposed and a wet napkin kept on the knee. December 1st, the bones have apparently united and there is very little discharge, the incisions having healed, with the exception of a point on either side of the joint, from which a few drops of pus are escaping. The patient suffers no pain, and I shall to-day flex the knee a trifle permanently. The leg was kept on a straight plank and between the hay cushions until December 20th, when I put the limb in a starch bandage, well stiffened by strips of pasteboard. On December 26th, I slit the bandage open from the toe to the hip and discovered some erythematous blush on the skin, also a slight general disturbance, accompanied by dry tongue. The febrile symptoms yielded readily to acidulated drinks and a little spirits of mindererus. On December 28th, the patient was sent to a Northern hospital by the steamer Star of the South. I saw the man in hospital at Fort Wood in July following. He was not able to walk then, but subsequently he did so with the assistance of a cane, and was discharged."

FIG. 240.—Condyles of right femur primarily excised. *Spec.* 2030.

The records of Fort Wood Hospital, Bedloe's Island, show that the patient was admitted December 31st, and that he was discharged August 28, 1863, Acting Assistant Surgeon O. W. Gibson certifying to the disability arising from "resection of knee joint." Five months afterwards, when making an application for pension, the man was examined by Surgeon J. A. Wolf, 29th Pennsylvania, who certified to the following disabilities as resulting from the wound: "He has anchylosis of the injured joint, also paralysis of both inferior extremities. He is now permanently confined to his bed, being entirely unable to move his body or inferior extremities." The reports of different examining surgeons show no improvement in his condition up to September, 1874, at which time the pensioner was exempted from further examinations. The photograph represented in FIGURE 2 of PLATE LXV, opposite page 386, was obtained from Dr. Bontecou, who mentioned that the paralysis came on some time after the patient's recovery from the operation and after his arrival at home. He also suggested that the attack "may have been caused by malarial poison." In several letters received from the pensioner, the last one being dated April 14, 1877, he depicts his condition as that of "a poor wreck," and states that owing to "the lower portion of his body being entirely powerless from the effects of the wound" he is obliged to keep in his bed all the time. His pension was paid December 4, 1879.[1]

In the following instance the primary excision was followed five days later by a successful intermediary amputation of the thigh at the junction of the middle and lower thirds of the femur:

CASE 587.—Private W. M. Constable, Co. H, 1st U. S. Cavalry, aged 26 years, was wounded in the right knee, at Dinwiddie Court House, March 31, 1865. He was admitted to a Cavalry Corps field hospital, whence Assistant Surgeon E. J. Marsh, U. S. A., reported: "Severe fracture of external condyle of femur and of head of tibia by a bullet; treated by excision; missile removed; chloroform used." Five days after the date of the wound the limb was amputated by the circular method at the junction of the middle and lower thirds of the thigh. This operation was done at Judiciary Square Hospital, Washington, by Acting Assistant Surgeon F. H. Colton, who also, three months later, at Douglas Hospital, performed a second operation, removing a sequestrum, two inches long and one-fourth inch wide, from the stump. By August 29th the stump had entirely healed, and one week afterwards an artificial limb was fitted by the Jewett Patent Leg Co. The patient was subsequently discharged from Harewood Hospital, November 18, 1865, and pensioned. Several years afterwards he served for a period in the 44th Regiment (Invalid) of Infantry. The pensioner was paid March 4, 1880.[2]

Fatal Cases of Primary Excision at the Knee Joint.—Twenty-six primary excisions of the knee joint terminated fatally. In ten instances, the condyles of the femur, the head of the tibia, and the patella; in two, the condyles of the femur; in three, the condyles of the femur and head of tibia; in one, the head of the tibia; and in five, the patella were the parts excised; in five instances the excised portions were not specified:

CASE 588.—Private J. F. Black, Co. H, 26th Illinois, was wounded in the left knee, at Jonesboro,' September 2, 1864. Surgeon W. M. Cake, 53d Ohio, reported his entrance into the field hospital of the 4th division, Fifteenth Corps, with "a fracture and comminution of the patella by a bullet; exsection of patella by Surgeon D. Halderman, 46th Ohio, six hours after the injury, under chloroform." Two days after the operation the patient was transferred to the general field hospital of the Fifteenth Corps, where he died September 11, 1864.

[1] See *Circular* No. 6, War Department, S. G. O., Washington, 1865, p. 58. LYON (I. W.), *Excision of the Knee and Hip Joints*, in *Am. Jour. Med. Sci.*, 1865, Vol. XLIX, N. S., p. 64; CULBERTSON (H.), *Excision of the Larger Joints of the Extremities*, Prize Essay, in *Transactions of the Am. Med. Assoc.*, Philadelphia, 1876, Supplement to Vol. XXVII, p. 182. [2] See TABLE XXXV, No. 43, p. 280.

CASE 589.—Private T. Clark, Co. D, 2d New Hampshire Cavalry,[1] was wounded near Alexandria, Louisiana, May 4, 1864. Surgeon C. Powers, 160th New York, in charge of the Alexandria Hospital, reported his admission with "a wound of the right knee joint, a ball entering the inner condyle of the femur, passing behind the blood-vessels, and emerging two inches above the joint on the outer side. The internal condyle was shattered, but there was no appearance of injury to the blood-vessels. Prostration was not great, the pulse being 90, but not strong. Amputation was immediately advised, but the patient positively refused to submit to it, preferring rather to lose his life than his limb. Chloroform was then administered and excision was performed by Assistant Surgeon J. Homans, jr., U. S. A., removing two inches of the femur and half an inch of the tibia through a horizontal incision. The patient reacted slowly. The wound was brought together with sutures and the limb was placed in a fracture-box. A full anodyne was administered to enable the patient to sleep. Next morning all that part of the limb below the incision was found to be cold and without pulsation in any of the arteries. On May 5th, the patient was moved on board of a transport for the purpose of being conveyed to hospital at New Orleans. He continued to sink, and died." The records of the Hospital Steamer Laurel Hill show that the patient's death occurred on May 7, 1864. Four years afterwards the operator communicated the following additional information in the case: "My view of the cause of death is this: The bullet in its course lacerated somewhat the coats of the popliteal artery. The anastomosis was cut off by the division of the arterial branches of the popliteal in the incision, which was the usual semilunar one, running from the posterior edge of one condyle to the other. The dorsalis pedis beat strongly for several hours following the operation, after which pulsation gradually ceased in it, and the limb became cold and then gangrenous below the line of the incision and the bullet wound. Undoubtedly a clot formed in the popliteal, and, afterwards, the coats of the artery gave way more or less, thus causing the hæmorrhages. The weather was very hot and the hospital boat very crowded and on a narrow river; but these circumstances had nothing to do with the patient's decease, which was caused, I believe, by occlusion of the popliteal artery."

CASE 590.—Corporal S. B. Carlton, Co. I, 4th Maine, was wounded at Chancellorsville, May 3, 1863, and admitted to the field hospital of the 1st division, Third Corps. Surgeon E. L. Welling, 11th New Jersey, recorded: "Shot wound of left knee; resection of internal condyle of femur;" and reported the patient's death May 9, 1863.

CASE 591.—Private C. Crowley, Co. C, 8th New Hampshire, was wounded at Port Hudson, May 27, 1863, and entered the field hospital of the Nineteenth Corps. Surgeon M. D. Benedict, 75th New York, reported: "Shot wound of right knee by musket ball; resection." Surgeon A. H. Van Nostrand, 4th Wisconsin, recorded that the wounded man was admitted to hospital at Baton Rouge, May 30th, with a "shot injury to the right knee joint," of which he died June 17, 1863.

CASE 592.—Corporal C. Dewell, Co. F, 74th Indiana,[2] aged 27 years, was wounded by a round ball, at the taking of Missionary Ridge, November 25, 1863, the missile entering the inner aspect of the right knee joint, fracturing the inner condyle of the femur, passing obliquely downward and outward, and lodging in the head of the tibia. He was conveyed to hospital No. 6, at Chattanooga, where, on the next day, he was placed upon the operating table, when the wound was examined. On consultation it was determined to practise exsection as affording the best means of saving the man's life. A semilunar flap was resorted to, the incision including the wound made by the ball as well as the opening made in examining the wound. The patella, seven-eighths of an inch of the femur, and five-eighths of an inch of the tibia were removed; no arteries were tied—two or three were twisted with the forceps. The patient did well until about Christmas, when he began to show marked symptoms of nervous exhaustion, which continued to increase in spite of the most sustaining treatment. He gradually sank until January 18, 1864, when he died. The operation was performed by Surgeon J. Haller, 38th Ohio, and the history was communicated by Surgeon J. R. Arter, 31st Ohio.

CASE 593.—Private J. Forster, Co. C, 15th New York Artillery, was wounded before Petersburg, July 9, 1864, and entered the field hospital of the 2d division, Fifth Corps. Surgeon T. M. Flandrau, 146th New York, reported: "Severe shell wound of both legs. Exsection of left and part of right patella." Three days after the reception of the injury the patient was moved to the corps hospital at City Point, where he died July 25, 1864.

CASE 594.—Private *J. P. Goforth*, Co. K, 11th South Carolina, aged 25 years, was wounded near Petersburg, and sent to the division hospital in the city about two hours after the injury, June 24, 1864. Surgeon Samuel Logan, C. S. A., reported:[3] "A gunshot wound, penetrating the left knee joint obliquely, tearing away both articular surfaces, but producing no splintering of the cancellated structure or shafts, merely grooving the articular surfaces and fracturing the patella. The pulse was at 90, and there was slight shock or constitutional disturbance." As the general hospital where he could be permanently treated was less than a quarter of a mile from the place where he was wounded, and the excellent state of the patient's general health and nature of the wound were encouraging, Dr. Logan considered the case as one in which excision was justifiable, the patient preferring any risk to the loss of his limb. He was placed under chloroform a few hours after the injury, June 24, 1864, and the operation was performed by **H**-incision, the cross cut including both orifices of the wound. The contused soft parts were removed with the patella after the articular surfaces of the femur and tibia had been sawn off. The parts seemed to present favorable conditions for a speedy union. A long splint was applied to the wound. On June 28th, Dr. Logan found the patient comfortable, the pulse at 110, skin warm and moist. The wounds were slightly swollen but not painful. The limb was dressed with Smith's anterior wire splint and suspended, water dressing being employed by irrigation. July 1st, the patient was found restless, the pulse at 120; tongue dry; the wounds were erysipelatous in appearance and swollen. The patient sank and died. Surgeon Logan could not ascertain the precise date, but it was prior to July 14, 1864.

CASE 595.—Private G. Gregory, Co. K, 57th New York, aged 28 years, was wounded at Fredericksburg, December 13, 1862. Surgeon C. S. Wood, 66th New York, reported that he was admitted to the field hospital of the 1st division, Second

[3] LOGAN (SAMUEL), *Report of Two Cases of Primary Resection at the Knee Joint for Gunshot Wounds*, in *Southern Med. and Surg. Jour.*, 1866, Volume XXI, p. 293.

Corps, with "exsection of the left knee joint, performed by some unknown surgeon," and that the limb was placed in a long padded splint, bandaged in its whole length, and dressed with cold-water applications. Surgeon W. Clendenin, U. S. V., reported that the patient was admitted to Emory Hospital, Washington, December 26, 1862, with gunshot wound, and that he died the same day.

CASE 596.—"Private *E. M. Hogston*, Co. D, 4th Virginia, aged 29 years, was wounded in the right knee joint, at Chancellorsville, May 3, 1863, a ball entering through the patella, fracturing the inner condyle and lodging. In addition there was a flesh wound of the same leg. The patient positively and persistently declined amputation, which was urgently recommended. As a final resort, resection was advised and accepted in preference to amputation. The operation was performed on May 5th, the joint being opened by an H-incision, and the fragments of the fractured patella removed with the ball lodged in the inner condyle. The synovial membrane and articular cartilages of the articular surfaces were carefully dissected out, and, in addition, a thin slice of bone was removed from the contiguous surfaces of the condyles and upper surface of the tibia, so that when the parts were brought into apposition an obtuse angle was formed at the joint site. The limb was firmly fastened to a well padded and suitably arranged posterior angular splint; the joint was dressed with dry lint and oiled silk covering. On May 10th, the wound was suppurating freely. 12th, still doing well. 14th, weaker, with tendency to diarrhœa. 15th, gangrene of thigh. 17th, patient died." The history was contributed by Dr. I. W. Walls, late Surgeon P. A. C. S., in November, 1877.

CASE 597.—Private J. Lambert, Co. E, 1st Michigan Cavalry, aged 33 years, was wounded in the left knee joint, at Cold Harbor, May 31, 1864. Surgeon W. H. Rulison, 9th New York Cavalry, reported that resection was performed at the field hospital of the 1st division, Cavalry Corps. Acting Assistant Surgeon S. Graham reported that the patient was admitted to Emory Hospital, Washington, June 7th, in a weak and debilitated condition, caused by a "shot fracture of the knee joint, the head of the tibia having been excised" before admission. Tonics, stimulants, and nourishing diet constituted the treatment, and water dressings and bandages were applied locally. The patient became delirious June 12th, and died June 16, 1864.

CASE 598.—Private E. Lewis, Co. B, 87th Pennsylvania, was wounded at Winchester, September 19, 1864. Surgeon R. Barr, 67th Pennsylvania, described his injury as a "severe wound of the right thigh by a minié ball, fracturing the condyles" of the femur, for which "resection" was performed at the field hospital of the 3d division, Sixth Corps. Acting Staff Surgeon N. F. Graham reported that the patient was admitted to the general field hospital at Sandy Hook six days after the date of the battle, and that he died of his injury, a "shot wound of the right knee," on October 10, 1864.

CASE 599.—Sergeant Henry J. Moore, Co. F, 7th Maine, aged 24 years, received, May 12, 1864, a shot wound of the left knee joint, at the battle of Spottsylvania. Surgeon F. M. Everleth, 7th Maine,[1] practised a primary total excision on the morning of the reception of the injury "by making an anterior incision across just below the joint, curving up over the external condyle, and joining at right angles an incision extending over the internal condyle; one inch and a half of the femur, with a conoidal ball implanted, was removed by sawing squarely through the condyles, and the articular surface of the tibia was removed, being bruised. No ligatures were required. The specimen was sent to the Museum at Washington with an account of the case." The patient was admitted May 24, 1864, to the Third Division Hospital, at Alexandria, with the left lower extremity in a fracture box, the wound being partially closed by sutures and discharging little pus. The patient was prostrated by the fatigues of transportation, and he died of exhaustion May 26, 1864.

CASE 600.—Private *I. Moore*, Co. B, 44th Alabama, received a shot fracture of the right knee joint October 1, 1864, for which resection by a semilunar flap was performed on the following day. The record of the case was found on the Confederate register of Howard Grove Hospital, Richmond, where the patient died October 22, 1864.

CASE 601.—Lieutenant *G. W. Pettigrew*, Co. A, 26th Georgia, was wounded and captured at Fredericksburg, December 13, 1862. Surgeon C. J. Nordquist, 83d New York, recorded his admission to the field hospital of the 2d division, First Corps, with "shot wound of left knee; patella removed." Acting Assistant Surgeon J. D. Robinson reported that the patient was admitted to the Patent Office Hospital, Washington, December 25th, and that he died of his injury, "a shot wound of left side and knee," December 30, 1862.[2]

CASE 602.—Dr. J. J. Knott, late Surgeon of the Confederate army, in a letter from Griffin, Georgia, November 6, 1868, makes mention of the following: "I practised excision of the knee joint in one case only. This was performed on a German, belonging to the Federal army, after the battle of the Wilderness, in May, 1864. The patient died from the effects of chloroform."

CASE 603.—Private J. Wheeler, Co. E, 97th New York, was wounded at Fredericksburg, December 13, 1862. Surgeon C. J. Nordquist, 83d New York, recorded his admission to the field hospital of the 2d division, First Corps, with "shot wound of knee; patella removed." On December 25th, the wounded man was admitted to the Patent Office Hospital, Washington, whence Assistant Surgeon G. W. Hoover, 132d Pennsylvania, reported that the patient died from the effects of a "wound of the left knee joint," February 1, 1863.[3]

---

[1] At the date of the publication of this case in *Circular* No. 6, S. G. O., 1865, p. 59, the operator's name and the date of the excision were unknown; but these particulars were communicated in a letter to Assistant Surgeon General C. H. CRANE, dated Waldoboro,' Maine, March 26, 1868, by Dr. F. M. EVERLETH. The specimen, with the impacted ball in the condyles, and the account of the case, alluded to by Dr. EVERLETH, it has been impossible to trace in the Museum. See also CULBERTSON (H.), *Excision of the Larger Joints of the Extremities*, Prize Essay, in *Trans. Am. Med. Assoc.*, Philadelphia, 1876. Supplement to Vol. XXVII, p. 184, Case 16.

[2] A letter of inquiry was addressed, in February, 1868, by the editor to Dr. R. S. Dana, formerly Surgeon 107th Pennsylvania, who, in an answer dated March 23, 1868, states: "I have written to several of the surgeons who were there, to learn if possible more of the case than I can recollect; one answer only has been returned. From all that I can learn or remember of the case, Lieutenant Pettigrew was operated on by Dr. E. G. Chase, Surgeon 104th New York, and Dr. J. F. Hutchinson, at that time Surgeon of the 107th Pennsylvania. The operation was the resection of the head of the fibula, which was destroyed by a ball, the operation not involving the knee joint proper."

[3] In response to the editor's letter of inquiry, Dr. R. S. Dana, of Morrisville, Pennsylvania, formerly Surgeon 107th Pennsylvania, wrote under date March 23, 1868: "Private Jerome Wheeler I cannot be so positive about, but think that he was operated on by Drs. Nordquist and Coxe, Surgeons of New York regiments, and that in his case the joint was penetrated by a ball, and the operation consisted in the removal of the upper portion of the head of the tibia and the opposing surface of the condyles of the femur, calculating that bony union and a fixed knee would result, shortening the limb from 1 to 1½ inches. The result of the operation we know nothing about, as the hospital was cleared as rapidly as possible."

CASE 604.—Corporal *J. White*, Co. I, 21st South Carolina, aged 25 years, was wounded June 24, 1864, at Petersburg He was conveyed to the division field hospital in the city, and, two or three hours after the injury, was examined by Surgeon Samuel Logan,[1] C. S. A., who found that the missile, probably a conical musket ball, had passed through the external condyle of the right femur, laying open the joint freely and carrying away a portion of the articular surface. There was a slight flesh wound in the right arm. The case was considered favorable for excision, and the operation was done immediately by Dr. Logan, through an H-incision, removing an inch from the condyles of the femur, slicing off the top of the tibia, and removing all contused soft parts. The limb was bound to a long external splint. June 26th, the wounds were somewhat swollen, and the dressing had caused pain by undue pressure. The patient was restless, with pulse at 115. June 27th, general symptoms unaltered. The limb is as much swollen but is more comfortable since the dressings have been arranged. June 28th, the flesh wound in the arm is painful and swollen. The leg is less swollen, and union appears to be taking place. July 8th, general condition favorable; pulse 110; leg somewhat swollen. All retentive apparatus was removed; every movement of the body or limb thus disturbed the relations of the osseous surfaces. Dr. Logan did not see the patient again, but he heard that death occurred prior to July 15, 1864.

In three instances of primary excision at the knee joint recourse was had to amputation of the thigh. Death ensued in two, four, and thirty-nine days, respectively:

CASE 605.—Private J. W. Derr, Co. E, 7th Maryland, aged 18 years, was wounded at Hatcher's Run, March 31, 1865, and admitted to the field hospital of the 2d division, Fifth Corps. Surgeon A. A. White, 8th Maryland, reported: "A musket ball struck the patella of the right knee laterally, shattering the patella into a number of fragments, but not involving the knee joint proper. I excised the entire patella, carefully dissecting it from its covering." Surgeon A. F. Sheldon, U. S. V., reported that the patient was admitted to Campbell Hospital, Washington, April 5th, with the incised wound of the operation healing by first intention. After doing well for three weeks, inflammation commenced and suppuration became very great. Circular amputation through the lower third of the thigh was performed on May 15th, by Acting Assistant Surgeon F. Hall, after which there was favorable progress for a time. On June 10th, there were signs of morbid poisoning, and on June 15th the stump was opened, allowing a canal filled with pus to discharge. Death resulted from exhaustion June 23, 1865. The amputated part of the femur, together with the upper portions of the tibia and fibula, were contributed to the Museum by Surgeon Sheldon, and constitute specimen 4199 of the Surgical Section.

CASE 606.—Corporal A. Glazier, Co. B, 1st Minnesota, aged 29 years, was wounded at Reams's Station, August 25, 1864. Surgeon N. Hayward, 20th Massachusetts, reported the injury as a "shot fracture of the left knee joint," for which he performed excision at the field hospital of the 2d division, Second Corps. Surgeon D. W. Bliss, U. S. V., reported that the patient was admitted to the Armory Square Hospital, Washington, August 28th, in a low condition and suffering severe pain from nervous spasms of the limb, caused by a wound of the knee joint with slight fracture of the external condyle, the patella having been removed on the field. Circular amputation at the lower third of the thigh was performed by Acting Assistant Surgeon D. W. C. Van Slyck on the day after admission. Chloroform inhalation induced alarming symptoms, and electricity was resorted to. Opium and alcoholic and diffusible stimulants were administered. Gangrene appeared in the stump the second day and spread rapidly. Death resulted on September 2, 1864.

CASE 607.—Private W. E. L. Morrison, Co. I, 29th Connecticut, aged 21 years, was wounded near Richmond, October 27, 1864, and admitted to the Flying Hospital of the Tenth Corps. Surgeon M. S. Kittinger, 100th New York, recorded: "Shot wound of left knee; excision of knee by Surgeon A. C. Barlow, 62d Ohio." The subsequent progress and the result was reported by Assistant Surgeon E. McClellan, U. S. A., as follows: "The patient was admitted to hospital at Fort Monroe, October 30th, with shot fracture of knee joint. Circular amputation at the middle third of the thigh was performed on November 10th by Acting Assistant Surgeon J. Pitkin. Chloroform and ether constituted the anæsthetic. The patient died November 12, 1864, of exhaustion."

To the primary cases of excision at the knee here detailed should be added six instances observed by Professor Hunter McGuire,[2] of Richmond, formerly Surgeon of the Confederate States Army:

CASES 608–613.—"In May, 1864, at Spottsylvania Court House, the operation was performed in six cases by some surgeons sent from this city to our assistance. Not to subject them to the danger of transportation, I left these cases, with others too badly hurt to be moved, in a hospital, prepared for them near the field of battle, and in charge of one of the best surgeons in the army, Dr. Taylor, who gave them every possible attention. Three of them died before the end of the third day. In two of the cases, secondary amputation was performed with a view of preserving life, but unsuccessfully, and the sixth lingered for about four weeks, I think, and proved fatal from sheer exhaustion. Such, as far as I can gather, is the melancholy record, and although the number is too small to justify a comparison with amputation, I do not think there is any one who saw the six patients I have reported—men who a day or two before were stout, strong and brave soldiers—who would not agree with me in saying, this operation for wounds occurring upon the battle field is nothing more nor less than butchery."

Primary Excisions at the Knee Joint of Undetermined Result.—The results of two of the thirty-two primary excisions at the knee joint could not be ascertained:

CASE 614.—Private *A. McDowell*, Co. K, 1st North Carolina, received a shot fracture of the patella and the external

[1] LOGAN (S.), *Report of two cases of Primary Resection at the Knee Joint for gunshot wound; death resulting in both cases*, in *Southern Medical and Surgical Journal*, 1866, Vol. XXI, p. 295.

condyle of the femur by a minié ball, at Hanover Junction, May 24, 1864. He was admitted to the Receiving and Wayside Hospital, Richmond, where, on May 26th, he was placed under the influence of chloroform, and excision of the fractured parts was performed by Surgeon C. B. Gibson, C. S. A. Splints and water dressings were used after the operation. Reaction was fully established on the following day. On May 30th, the wound looked well, and the patient was transferred to another hospital at the request of Dr. Gibson. The record of the case was obtained from the Confederate register of the Receiving and Wayside Hospital, Richmond.

CASE 615.—Among the names of wounded men admitted to the Nineteenth Corps field hospital from the battle of Port Hudson, May 27, 1863, Surgeon M. D. Benedict, 75th New York, includes that of "Private A. W. Mousky, Co. B, 4th Wisconsin," whose injury was reported as follows: "Shot wound of right leg; excision of knee joint." It has not been practicable to ascertain the termination of the case.

Intermediary Excisions at the Knee Joint.—Thirteen cases were referred to this group; one only proved successful, a ratio of fatality of 92.3 per cent. The operations were practised on ten Union and three Confederate soldiers.

Recovery after Intermediary Excision at the Knee Joint.—A successful intermediate operation[1] was performed on a captain of the Confederate army wounded at Mine Run, November 27, 1863. He was last heard from in 1877, fourteen years after the operation. He then experienced only little disability, principally due to shortening, and he could walk for miles without fatigue.

CASE 616.—Captain *Charles Knowlton*, 10th Louisiana, of Ewell's Corps, aged 26 years, was wounded at Mine Run, Virginia, November 27, 1863, by a conoidal musket ball, which grooved the outer condyle of the right femur, barely touched the cartilage, opened the synovial sac, was deflected, and lodged near the upper edge of the patella, whence it was removed, on the field, through an incision, after the wounded man had walked half a mile to the rear leaning on the shoulder of one of his men. He was then transported over rough roads in an ambulance to the nearest railway station, and conveyed to Richmond, and entered general hospital No. 4 two days after receiving the injury. His condition on admission was good. There appeared to have been no hæmorrhage. The movements of the knee joint were perfect. Moist dressings, absolute rest, and saline aperients were ordered. On December 2d, a serous or synovial discharge from the wound was observed. This became slightly puriform on the following day. Still there was no mark of inflammatory reaction. On December 8th, there was much pain in the joint and the discharge was increased. Warm fomentations were substituted for the cold dressings. His pulse rose to 104. On the 9th, the joint was excessively inflamed and the pulse was 128. Surgeon James B. Read, P. A. C. S., in consultation with Surgeons C. B. Gibson and M. Michel, decided that excision of the joint was expedient. The operation was performed by Surgeon Read. An elliptical incision with its concavity upward was made to extend from one condyle to the other, passing below the patella and dividing its ligament. The joint was then laid open, and an inch and a half of the condyles of the femur and an inch of the tibia were sawn off. The patella was also removed. No ligatures were required. The section of the femur was made obliquely downward and backward; the section of the tibia was the reverse of this, so that when the extremities were approximated the limb was slightly flexed. The synovial sac was reddened and contained a turbid flocculent fluid. The sawn ends of the bones were then wired together. The limb was then placed in a long well padded fracture box. After a few days a long bracketed splint was substituted for the fracture box. He had a liberal stimulating diet of eggs, oysters, and beef tea, with half an ounce of brandy every two hours. The patient was restless and irritable, and on December 16th, and again on the 20th, had venous hæmorrhage to the extent of a few ounces, the bleeding being arrested on both occasions by the use of persulphate of iron. There was tumefaction about the joint and burrowing of pus, until Acting Assistant Surgeon Howell L. Thomas suggested a suspension of the limb by Smith's anterior splint. By January 3d, the internal half of the horse-shoe incision had closed. The patient enjoyed an excellent appetite, which was appeased by venison, turkey, partridges, and other hearty food, and a pint of porter daily. By the middle of February there was only a small fistulous orifice remaining of the wound, which discharged a thin, sero-purulent matter. A starch bandage was now applied, with an aperture over the unhealed portion of the wound. All the wires had been removed at this date except one. In March, the patient sat up daily and attempted to walk on crutches. In April, he was discharged from the hospital; his limb was supported by a leathern splint. There was still slight motion between the femur and tibia, but the ligamentous union appeared quite firm. He subsequently went to the West Indies. At Nassau, Dr. Hunt, of New Orleans, removed the starch bandage and found the consolidation was very firm. In a few months Captain *Knowlton* laid aside his crutches and walked very satisfactorily. He returned to Louisiana in 1866. He was able not only to walk almost as well as ever, but to dance even the round dances. His address as a purser on the steamship "Senator," one of the Pacific mail steamers plying between San Francisco and San Luis Obispo, having been discovered, Surgeon Charles McCormick, U. S. A., at San Francisco, examined his limb, December 17, 1868, and had prepared the photograph from which FIGURE 1 of the lithographic plate (PLATE LXV) opposite p. 386 was taken. There was no evidence of disease about the cicatrix. The muscular development of the limb was good; and the inability to flex it at the knee was the only inconvenience suffered, a result as gratifying as it is unusual. A letter from Surgeon Charles C. Keeney, U. S. A., Medical Director at San Francisco, dated April 20, 1877, mentioned that he had met Captain *Knowlton* about a year previously and learned that he experienced no disability save that due to the shortness and stiffness of the limb, and walked for miles without fatigue.

[1] DE ROSSET (M. J.), READ'S *Case of Excision of Knee Joint*, in *Confederate States Medical and Surgical Journal*, 1864, Vol. I, p. 83, and *Savannah Journal of Medicine*, 1866, Vol. V, N. S., p. 33; READ (J. B.), *Report on Wounds of Large Joints, made to the "Confederate States Association of Navy and Army Surgeons," Richmond, Va.*, 1864, in *Southern Medical and Surgical Journal*, 1866, Vol. I, 3d series, p. 213, and *New York Medical Journal*, 1866, Vol. III, p. 73.

Fatal Instances of Intermediary Excision at the Knee Joint.—This group comprises twelve cases, ten in the Union and two in the Confederate armies:

FIG. 241.—The inner half of the right patella, in two fragments. *Spec.* 1065.

CASE 617.—Private O. Derocher, Co. I, 1st Maine Heavy Artillery, aged 31 years, was wounded in the right knee, at Spottsylvania, May 19, 1864, by a conoidal musket ball, which fractured and comminuted the patella. Three days after the reception of the injury he was admitted to Emory Hospital, Washington, the soft parts about the knee being badly swollen. On May 23d, the inner half of the patella was excised by Surgeon N. R. Moseley, U. S. V. The operation was followed by cold-water dressings. By May 30th erysipelas had invaded the limb, for which carron oil and copper wash was applied, and tincture of iron was administered. Stimulants and generous diet were allowed liberally. The patient died from the effects of constitutional irritation and exhaustion, June 10, 1864. The history and the excised bone (FIG. 241), consisting of two fragments (*Cat. Surg. Sect.*, 1866, p. 363, *Spec.* 1065), were contributed by the operator.[1]

FIG. 242.—Left knee after excision. *Spec.* 629, A. M. M.

CASE 618.—Private Charles F. Gould, Co. I, 1st Pennsylvania Reserves, was wounded at the second battle of Bull Run, August 30, 1862. A musket ball appeared to have entered the outer side of the joint near the head of the tibia. The patient was sent to Fairfax Seminary Hospital, near Alexandria, September 9, 1862. On September 15th, an excision of the knee joint was performed. The condyles of the femur, the patella, and the heads of the tibia and fibula were removed through an H-shaped incision. The wound united, and there seemed every prospect of a satisfactory result, when, on October 8th, symptoms of pyæmia were developed, and death ensued October 12, 1862. The pathological preparation was forwarded to the Army Medical Museum by Acting Assistant Surgeon T. O. Bannister. The specimen represented in the left-hand wood-cut (FIG. 242) shows the osseous portion, while the appearance of the soft parts are shown in the right-hand wood-cut (FIG. 243). (See *Cat. Surg. Sect.*, 1866, pp. 336, 500.)[2]

FIG. 243.—Soft parts from same excision. *Spec.* 600.

CASE 619.—Corporal G. W. Hays, Co. K, 2d Michigan, aged 19 years, was wounded in both knees, at Petersburg, June 17, 1864. Surgeon R. B. Bontecou, U. S. V., reported: "He was admitted to Harewood Hospital, Washington, June 20th, suffering from amputation at the lower third of the thigh, performed on the field for a shot wound of the knee joint by a ball, which fractured the condyles of the femur and the patella. The right knee was also wounded, a ball entering the joint, fracturing the patella, and denuding the condyles of the femur and the head of the tibia. Extensive suppuration followed in the right knee, and an abscess burrowed half way up the thigh; the joint itself became entirely disorganized and much swollen." On June 24th, resection of about two-thirds of the condyles of the femur, with the entire patella and the articular face of the tibia, was performed by Surgeon R. B. Bontecou, U. S. V. Sulphuric ether was used as the anæsthetic. The stump of the left thigh progressed very satisfactorily towards healing, while the resected joint commenced to fill up with healthy granulations also and looked well in other respects. Profuse suppuration of healthy looking pus, however, continued. The constitutional treatment was mainly directed towards supporting the strength of the patient, and consisted of stimulants, tonics, and nourishing diet. The right thigh and leg were supported and kept in place by means of a wide board, to which a bag of bran was attached and so arranged as to embrace the parts on either side, it being readily adjusted and kneaded to suit the manipulations during dressing. The entire extremity, from the foot to the great trochanter, was confined in a Scultetus' bandage. The patient did tolerably well up to June 30th, from which date he became drowsy and was only waked with difficulty. He continued so, with intervals of wakefulness, until his death, which occurred on July 2, 1864, from exhaustion. There were no pyæmic symptoms. The exsected patella and condyles of the femur were contributed to the Museum by the operator and are represented in the cut (FIG. 244).[3]

FIG. 244.—The patella and condyles of the right femur. *Spec.* 3046.

CASE 620.—"Private *J. W. Holtzman*, Co. B, 2d Virginia, about 35 years of age, was wounded at Chancellorsville, May 3, 1863, a ball entering the knee joint through the patella and lodging in the head of the tibia. The patient persistently declined amputation and other active interference until much suffering and pain induced him to accept the chances of a resection, which was reluctantly performed on May 10th. The joint was laid open by a semilunar incision, the synovial membranes and cartilages were removed, and thin slices of the contiguous surfaces of the condyles and head of tibia were taken off. The limb was placed in a posterior angular splint and carefully watched. The patient, however, finally succumbed to diarrhœa and exhaustion about May 20, 1863." The history of the case was communicated by Dr. I. W. Walls, late Surgeon P. A. C. S., in November, 1877.

CASE 621.—Private M. B. Horan, Co. F, 63d New York, was wounded at Antietam, September 17, 1862, and entered Frederick Hospital one week afterwards. Surgeon H. S. Hewit, U. S. V., contributed the pathological specimen (*Cat. Surg. Sect.*, 1866, p. 290, *Spec.* 445), and reported the case as a "partial resection of the knee joint, performed, October 4th, for a shot injury of the condyles of the femur, and followed by death October 14, 1862." The specimen consists of thirteen minute fragments of dead bone.

CASE 622.—Private H. Lawson, Co. D, 36th Colored Troops,[1] aged 17 years, was accidentally wounded March 5, 1864, and entered Point Lookout Hospital six days afterwards. Surgeon A. Heger, U. S. A., reported: "He was admitted with shot fracture of the right knee joint, caused by a conical musket ball, which entered one-half inch inside of the tuberosity of the tibia and emerged at the middle of the popliteal space. The knee joint was inflamed and suppurating; the patient, suffering from acute bronchitis, was otherwise in good constitutional condition. On March 12th, resection of the knee joint was performed by a longitudinal incision seven inches long over the anterior border of the internal lateral ligament, dividing the capsule and crucial ligament, and removing the fractured portions of the tibia and the articular cartilages. All the cartilaginous covering of the femur and the tibia was removed with a scraper; the synovial membrane was destroyed by iodine; no arteries ligated; wound closed by sutures of iron wire. The anæsthetic, consisting of chloroform, acted well for forty-five minutes. After the operation, which was performed by Acting Assistant Surgeon T. Liebold, the limb was placed at once in a plaster of Paris splint, enclosing the whole extremity. The next day an opening was cut over the wound so as to permit its being syringed with tepid water four times a day. Solution of permanganate of salts was also applied, and oakum was used to absorb the discharge. For the bronchial affection wine of antimony and infusion of ipecacuanha was prescribed. The patient died during a paroxysm of coughing, March 24, 1864. The *post-mortem* examination exhibited extensive inflammation of the bronchii, the smallest ramification being filled with pus; other organs healthy. The parts operated on looked well. Good pus was found in the bursa mucosa quadriceps."

CASE 623.—Private J. Miller, Co. A, 3d Pennsylvania Cavalry,[2] aged 38 years, was wounded at Mine Run, November 27, 1863, by a conical ball, which entered the right knee above and internal to the patella and emerged below and external to that bone. The missile fractured the patella, denuded the external condyle of the femur of a portion of its articulating surface, and fractured the outer articulating surface of the tibia. The wounded man was admitted to the Third Division Hospital, Alexandria, December 5th, considerably prostrated and the parts being tumefied. Two days after admission chloroform was administered and resection was performed by Surgeon E. Bentley, U. S. V., who removed the patella and half an inch of the articulating surfaces of the femur and tibia. The subsequent treatment consisted of simple dressings, tonics, stimulants, and nourishing diet. There was profuse suppuration. The patient progressed favorably for one week, when he was seized with chills accompanied by loss of appetite, quick and feeble pulse, and sallow hue of skin. He died of pyæmia December 18, 1863. The history was reported by the operator.

CASE 624.—Sergeant G. Northard, Co. G, 2d Ohio Cavalry,[3] aged 23 years, was wounded at Five Forks, April 1, 1865. Surgeon W. W. Bowlby, 3d New Jersey Cavalry, reported his admission to the field hospital of the 3d division, Cavalry Corps, with "severe shot wound of right knee." Surgeon R. B. Bontecou, U. S. V., in charge of Harewood Hospital, Washington, subsequently operated on the injured limb, of which he contributed a photograph (*Contr. Photo's*, S. G. O., Vol. I, No. 41), with the following history: "The patient was admitted April 5th. He had been wounded by a ball entering just above the patella, through which it passed and which it fractured into six fragments. Ranging downward and outward the missile fractured the external condyles of the femur and escaped. On April 8th, the patient was etherized, when the fractured patella and a fragment of the external condyle of the femur were removed. The constitutional state of the patient at the time of the operation was very good. After the operation the limb was placed in a box containing bran and the patient was put on low diet. Subsequently the limb was placed upon a light open splint, extending from the tuberosity of the ischium to a point near the heel, and suspended by a cord. The patient was put on nutritious diet, with wine and porter. On April 13th, he was transferred to a tent ward. Up to this time he had suffered considerable pain in the joint and was very restless and irritable. His appetite now became poor, and hiccough and vomiting set in. Suppuration was profuse. The patient died April 22, 1865, from exhaustion."

CASE 625.—Private J. Noble, Co. D, 30th Ohio, was wounded at South Mountain, September 14, 1862, and admitted to hospital No. 5, Frederick, four days afterwards. Surgeon H. S. Hewit, U. S. V., recorded: "Comminuted fracture of right knee by minié ball. Excision of a large portion of knee joint on September 30th. Death on October 5, 1862."

CASE 626.—Private *D. F. Rogers*, Co. I, 49th Georgia,[4] aged 34 years, was wounded at Petersburg, April 2, 1865, by a musket ball, which struck the right knee joint anteriorly, passed through the patella, comminuting it completely, and the outer condyle, and made its exit at the outer posterior aspect. He was admitted to the general hospital at Fort Monroe, April 13th. Surgeon D. G. Rush, 101st Pennsylvania, who operated in the case after applying an anæsthetic composed of chloroform and ether, reported as follows: "My attention was called to the case on April 18th, when the patient was suffering from great pain, and the knee, leg, and thigh were extremely swollen. A dense fibrous involucrum of the joint closed the track of the ball, thus preventing the escape of pus. I at first decided to lay the joint freely open and to remove the patella only, but discovering the disorganized and injured state of the condyles, they were also removed, with little hope of saving the patient, however, the operation being performed at too late a period. A piece of catheter was fixed in the joint to drain it. Cold-water dressings were applied. The patient rallied perfectly and lived comfortably for six days. He died of exhaustion the eighth day. He could not have survived amputation twenty-four hours. I think this operation could be performed with success primarily in cases in which the patella and condyles alone are involved." The excised bones were contributed to the Museum by the operator, and are represented in the cut (FIG. 245).

FIG. 245.—Bones of right knee excised. *Spec.* 4212.

[4] See *Circular* No. 6, War Department, S. G. O., Washington, 1865, p. 60; CULBERTSON (H.), *Excision of the Larger Joints of the Extremities.* Prize Essay, in *Trans. Am. Med. Assoc.*, Philadelphia, 1876. Supplement to Vol. XXVII, p. 186, Case 30.

CASE 627.—Corporal J. Sims, Co. B, 4th Ohio,[1] aged 23 years, was wounded at Mine Run, November 27, 1863, by a conoidal ball, which entered the right knee joint just below the patella, on the inner and anterior aspect, fracturing the inner condyle and opening the joint, passed downward and forward, and was extracted about four inches from point of entrance. He was admitted to the Third Division Hospital, Alexandria, December 5th. "At the time of admission the joint and thigh were very much inflamed and discharging pus copiously, and the man was much prostrated and terribly anxious as to the result of the wound. But after being washed and fed and otherwise cared for, he appeared much recruited. On the 8th of December the operation of excision of the knee joint was performed by Surgeon E. Bentley, U. S. V., who removed one inch of the femur and about one and a half inches of the tibia and fibula. The hæmorrhage was slight, but the condition of the tissues was not very satisfactory. The patient endured the operation well under the influence of chloroform, and reacted well. On the following day he complained of severe pain over the lung on the right side of the chest, which continued for several days. On the 10th, he had a severe chill at night, which was followed by two, more severe, on the 11th. Stimulants were freely given with raw eggs well beaten up, and beef essence for diet. He continued to have chills till the night of the 13th, when he was seized with a very severe one, from which he never rallied. He died on the morning of December 14, 1863. The *post-mortem* examination showed no attempt at repair, there being considerable sloughing, while on the inside of the thigh there were numerous small abscesses. The heart and left lung were healthy, but the right lung was infiltrated with pus, and a single large abscess appeared upon the surface of the inferior lobe. There was no pus nor abscess found in the liver, but it was very much softened." The history, with the *post-mortem* specimen, represented in the cut (FIG. 246), was contributed to the Museum by the operator. Surgeon J. B. Brinton, U. S. V., who examined the limb two days after the patient's decease, found "the whole joint one suppurating mass; pus extending up and down, far down under the gastrocnemius and up between the muscles on the inside of the thigh; a long abscess in the sheath of the vessels, extending up to the middle of the thigh; small clot in femoral artery, thin and three inches long; none in femoral vein; surrounding tissues of vessels hardened in some places where pus had not reached; long membrane of femoral vein of dirty gray color and softened; clot in saphena vein."

FIG. 246.—Right femur, tibia, and fibula, after excis'n of joint surfaces. *Spec.* 1909.

CASE 628.—Corporal I. Wells, Co. A, 33d Wisconsin,[2] aged 42 years, was wounded at Tupelo, July 15, 1864, and admitted to Adams's Hospital, Memphis, five days afterwards. Assistant Surgeon J. M. Study, U. S. V., reported: "Shot wound of left knee by a conical ball, fracturing the patella and opening the joint; missile emerged over internal condyle. On July 21st, the inner third of the patella was removed through a vertical incision by Acting Assistant Surgeon R. W. Coale. The constitutional condition of the patient at the time of the operation was good. Cold-water dressings were applied to the parts, and stimulants, with beef juice, was given freely. The patient appeared to improve up to July 26th, after which date he commenced to decline. Pyæmia developed on July 29th, and from that time he continued in a comatose condition. Death resulted on August 2, 1864."

Secondary Excisions at the Knee Joint.—Seven examples of secondary excision at the knee joint are recorded; four were successful and three fatal, a rate of mortality of 42.8 per cent. The patients were all Union soldiers.

Examples of Recovery after Secondary Excision at the Knee Joint.—Of the four patients of this group, two were pensioners in 1880; one has never applied for a pension, and one died two years and a half after the operation:

CASE 629.—Private E. Jewell, Co. I, 8th New Jersey, aged 19 years, was wounded at Williamsburg, May 5, 1862, a musket ball fracturing both bones of the right leg near their articulation at the knee. He was sent to Hygeia Hospital, Fort Monroe, and thence in the following month to Philadelphia, where he entered Fifth Street Hospital on June 8th. Acting Assistant Surgeon A. C. Bournonville, in charge of the latter, reported that "the leg was bent at a right angle with the thigh and had been in that position since the injury. Caries had taken place, and an excision of the head of the fibula and partial resection of the head of the tibia was performed. The patient is now (November 6th) doing well, and has been able to rise and walk about the ward with the aid of crutches." The patient was subsequently transferred to Haddington Hospital, and was discharged February 23, 1863, and pensioned. Pension Examiner A. W. Woodhull, of Newark, October 24, 1868, described the injury: "A conoidal ball fractured both bones of the right leg just below the knee joint. Large portions of bone have been lost either by operation or nature. The bones are now extensively necrosed and enlarged, and there are two large sinuses, which always suppurate. The leg is shortened four or five inches," etc. The Newark Board reported, in September, 1875, that the limb is greatly atrophied and deformed. Two years later the same board reported "contraction of muscles of calf, producing talipes equinus; anchylosis of ankle and partial of knee. Wound open." The pensioner was paid March 4, 1880.

CASE 630.—Private J. E. Berry, Co. B, 5th Missouri State Militia, aged 22 years, was wounded by guerrillas in Carroll County, Missouri, December 1, 1862, a musket ball fracturing the external condyle of the femur and lodging in the knee joint. Acting Assistant Surgeon J. Thorne, who described the injury, reported that the wounded man was successfully treated in hospital at Kansas City for pyæmia, the systemic infection of which had appeared prior to the patient's admission, and was attended with formation of pus in the knee joint. In addition, Dr. Thorne also reported that the operation of removing the external condyle of the femur, together with the bullet, was performed on May 10, 1863, the missile being found embedded in the articulation.

[1] See *Circular* No. 6, War Department, S. G. O., Washington, 1865, p. 59; CULBERTSON (H.), *Excision of the Larger Joints of the Extremities.* Prize Essay, in *Trans. Am. Med. Assoc.*, Philadelphia, 1876. Supplement to Vol. XXVII, p. 184, Case 13.

[2] See CULBERTSON (H.), *Excision of the Larger Joints of the Extremities.* Prize Essay, in *Trans. Am. Med. Assoc.*, Philadelphia, 1876. Supplement to Vol. XXVII, p. 190, Case 15; *Circular* No. 6, War Department, S. G. O., Washington, 1865, p. 60.

The records of the hospital do not show the exact dates of admission or disposition of the patient. Adjutant General S. P. Simpson, of Missouri, communicated that Berry was mustered out of service June 22, 1863. There is no record of his ever having applied for pension.

CASE 631.—Private J. Friel, Co. F, 2d Kentucky, aged 29 years, was wounded in the right knee joint, at Chickamauga, September 19, 1863. Dr. G. E. Fuller, of Brooklyn, late Surgeon U. S. V., reported the following history: "The wound was caused by a musket ball, which entered just over the external condyle of the femur, passed obliquely downward and inward, and emerged at the junction of the middle and lower thirds of the tibia. He was in the hands of the rebels for eleven days, and was then taken to hospital No. 3, at Chattanooga. On January 18, 1864, he was transferred to hospital No. 8, at Nashville, where he first came under my observation. At this time the leg was flexed upon the thigh at something less than a right angle. Anchylosis of the knee joint had taken place and the patella was firmly attached to the condyles of the femur. Both the original wounds were healed, but there was still some purulent discharge from an abscess about four inches below the knee joint. Under a general tonic treatment he rapidly improved in strength and flesh, the abscess healed, and he was about the ward on crutches, being anxious to be discharged. On March 19th, he was transferred with other convalescents, and I lost sight of him. I had no reason to doubt the entire recovery of this patient, after a fracture of the femur and also a wound of the knee joint. The external treatment consisted of cold-water dressings." Surgeon G. F. French, U. S. V., under whose notice the patient came before his transfer, in a communication citing instances of successful conservatively treated cases of shot fractures of the knee joint, corroborated Dr. Fuller's description of the wound and its results, and added that the missile in its course "fractured the head of the tibia into the joint." The patient subsequently entered Jeffersonville Hospital, and lastly Main Street Hospital, Covington, where he was mustered out, by expiration of service, January 26, 1865, and pensioned. About twenty months afterwards the pensioner, with his injured knee joint in a diseased condition, entered the Good Samaritan Hospital, at Cincinnati. Dr. G. W. Haile,[1] the resident physician, reported: "The patient, being in an anæmic condition on admission, was ordered iron and generous diet, under which his health soon began to improve. On October 15, 1866, Professor G. C. Blackman operated for the removal of the dead bones, which could be readily felt with the probe. A crucial incision was made along the outer aspect of the joint, when some detached fragments of bone were found and removed, as was also the outer portion of the head of the tibia, which was in a carious condition. The wound healed very kindly, and the parts seemed for a while to be in a healthy condition; but in the course of a month from this operation the patient suffered at times violent pains in the part, and, on the 20th of November, a large collection of pus had formed in the joint, nearly a pint, mingled with fragments of necrosed bone, having been discharged during the twenty-four hours. His health began again to fail, but under the influence of tonics and a generous diet it was so far improved on the 14th of December, that Professor Blackman, in the presence of the class of the Medical College of Ohio, exsected the joint. An incision, resembling the letter **H**, was made on the anterior aspect of the joint, exposing the articular surfaces of the tibia and femur. With the ordinary amputating saw an inch and a half of the condyles of the femur, in a softened and carious condition, was removed, together with about one inch of the head of the tibia. The bone-gouge forceps were then employed to take away every suspicious looking portion and to round off the posterior margins of the divided surfaces, so as to render the popliteal vessels less liable to injury. The patella was removed. As the leg had been for a long time somewhat flexed upon the thigh, it was necessary to resort to considerable and prolonged force to overcome this contraction. At length the ends were found to be in apposition, and more of the soft parts included, when the flaps were brought together, and the limb was placed in a neat and carefully padded fracture box. During the operation the loss of blood was trifling; but shortly after the patient had been removed to his bed considerable hæmorrhage occurred. It appeared to come from no particular vessel, but there was a general oozing from the cut surfaces, which lasted several hours. The dressings were not disturbed for four days, the blood being wiped away as far as practicable, with a sponge, while the odor of that which could not be removed without disturbing the parts was corrected by disinfectants. Cold applications were applied over the joint; but little irritation followed, and the transverse incision healed by primary adhesion. A little pus was discharged for several days through the lateral incisions, after which it became very slight, and on the twenty-first day the entire wound seemed to have almost perfectly united. On the eighteenth day after the operation there was secondary hæmorrhage from a small superficial vessel and about ten or twelve ounces of blood were lost before it was discovered. It was readily controlled by pressure. Although perfect union between the tibia and femur seemed about this time to have taken place, the patient was ordered to remain perfectly quiet until the end of the eighth week, when he was allowed to walk on crutches. Just ten weeks from the operation he left for his home in Ironton, Ohio, and from a letter since received from him he seems highly pleased with the result of the operation." Examining Surgeon G. K. Taylor, of Cincinnati, June 25, 1867, certified to the injury and that "the joint is completely anchylosed, with the leg shortened several inches. He has also 'talipes equinus' of the right foot." Examining Surgeon D. C. Wilson, of Ironton, Ohio, at several subsequent examinations, also described the leg as "anchylosed in a straight

FIG. 247.—Appearance of right knee after excision of the patella and the articular ends of the femur and tibia. [From a photograph.]

[1] HAILE (G. W.), *Good Samaritan Hospital, Surgical Clinic, by* Prof. BLACKMAN. *Exsection of the Knee Joint for Gunshot Injury*, in *Cincinnati Journal of Medicine*, 1867, Vol. II, p. 157.

position, with four inches shortening." Examiner C. K. Crennit, of Jackson, Ohio, on April 29, 1879, reported the "muscles below the wound considerably atrophied, but sufficient to bear the weight of the body." The pensioner was paid December 4, 1879. The wood-cut (FIG. 247) is a representation of a photograph contributed by the operator.

CASE 632.—Private S. Miller, Co. L, 1st Missouri State Militia Cavalry,[1] aged 27 years, was accidentally shot in the right knee, by the discharge of his pistol, near Independence, December 28, 1862. The ball passed through the outer condyle of the femur, going obliquely through the patella and lodging in the head of the tibia. Three months after the injury the wounded man entered the Kansas City Hospital, where, on April 7, 1863, Acting Assistant Surgeon J. Thorne performed excision of the outer condyle of the femur, with part of the shaft, removing, by an oblique section, two and a half inches of the femur, together with the patella and the articulating surface of the tibia. No anæsthetic was used. At the time of the operation the leg had become extensively inflamed, the wound was found full of shattered bone, and an extraordinary amount of pus was coming out of the joint. Metastatic abscesses had appeared in the popliteal space. The patient had been suffering from severe pain and was almost insensible; pulse 120 and feeble. He had also severe diarrhœa and was much emaciated, his skin being dark and dry almost like parchment. The patient sank after the operation, but on the next day he revived and continued to do well. London porter was given as tonic. Complete union took place and complete anchylosis resulted, with the limb bent about ten degrees, so as to be almost as good as ever in walking. The details of the case were reported by the operator. The patient was discharged from service December 7, 1863, and pensioned. He died August 15, 1865. Dr. F. A. Simmons, of Rochester, Missouri, certified that he attended the pensioner from the time he returned to his home, and found that the injury had produced extensive suppuration, involving the leg and the thigh; also that he was very much emaciated, and that metastatic or pyæmic abscesses appeared in various parts of his body, which caused his death.

Fatal Cases of Secondary Excision at the Knee Joint.—Three instances are recorded. In one the entire knee joint was excised; in the second case the patella was removed; and in the third case the heads of the tibia and fibula were resected:

CASE 633.—Private G. Lewis, Co. B, 19th Indiana,[2] aged 22 years, was wounded at Gettysburg, July 1, 1863. He remained for two months at the First Corps field hospital, was then admitted to Camp Letterman, and subsequently transferred to Baltimore, where he entered McKim's Mansion and afterwards Jarvis Hospital. Assistant Surgeon D. C. Peters, U. S. A., in charge of the latter, reported: "The patient was admitted November 17th, with a wound of the right knee joint by a round musket ball, which lodged in the inner condyle. The position of the missile was detected by the Nélaton probe. Two weeks after the date of admission the wounded joint was in a state of disorganization and pouring off a large quantity of highly offensive pus, and the entire knee joint was excised by Acting Assistant Surgeon F. Hinkle, the patient having protested against amputation. Ether was used and an **H**-incision employed; wire sutures were applied to draw the sawn bones together. At the time of the operation the patient was feverish and unable to sleep from pain in the wound; pulse 100; skin dry; secretions scanty; appetite wanting. On the twelfth day he was seized with a violent chill, which lasted two hours and recurred every other day. Death resulted from pyæmia on December 23, 1863. At the autopsy both lungs were found filled with pus, the right being covered with abscesses. Six ounces of pus was also discovered in the left pleural cavity and four ounces of fluid in the pericardium. The wounded parts were healed externally and the bones in apposition; but no signs of union were manifest." The excised bone, embracing five-eighths of an inch of the upper extremity of the tibia and nearly two inches of the lower portion of the femur, with the bullet remaining lodged in the inner condyle, was contributed to the Museum by the operator, and is represented in the annexed cut (FIG. 248).

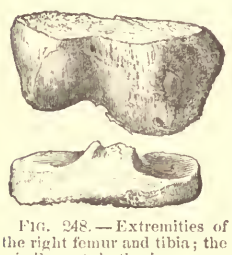

FIG. 248.—Extremities of the right femur and tibia; the missile rests in the inner condyle. *Spec.* 1956.

FIG. 249.—Bones of left knee after excision of the patella. *Spec.* 556.

CASE 634.—Private D. Sexton, Co. H, 11th Massachusetts, aged 18 years, was wounded at Bull Run, August 29, 1862. Surgeon D. P. Smith, U. S. V., recorded his admission to Fairfax Seminary Hospital, September 9th, with "shot wound of left knee joint," and reported that secondary resection of the patella was performed, also that the patient died November 6, 1862, from the effects of his wound and "exsection of the patella." The wood-cuts are representations of two *post-mortem* specimens, contributed by Surgeon Smith, one of which (FIG. 249) consists of a dried ligamentous preparation of the bones of the knee, presenting the appearance of inflammation having been followed by anchylosis; the other (FIG. 250) comprises the soft structures of the knee, and shows an **H**-shaped cicatrix, the horizontal portion being four inches and the upright three inches in length. The integument appears to have sloughed over a large portion of the front of the knee and to have cicatrized imperfectly, while on the lateral and posterior portions there are marks of several abscesses.

CASE 635.—Dr. H. Culbertson tabulates[3] a secondary operation, performed by Surgeon J. T. Hodgen, U. S. V., at the City Hospital, St. Louis, Missouri, in the fall of 1862, on a United States soldier, for a transverse shot wound of the head of the tibia, in which a **U**-incision was employed, and one inch of the head of the tibia and the tip of the fibula was removed, resulting fatally in three days.

FIG. 250.–Soft structures of the knee after excision of the patella. *Spec.* 607.

[3] CULBERTSON (H.), *Excision of the Larger Joints of the Extremities.* Prize Essay, in *Trans. Am. Med. Assoc.*, Philadelphia, 1876. Supplement to Vol. XXVII, p. 188, Case 9.

Excisions at the Knee Joint of Uncertain Date.—Five cases belong to this group; one proved successful, three were fatal, and the result in one is undetermined. The meagre details of these cases are of little value for statistical purposes:

CASE 636.—Sergeant *L. R. McWhorten*, Co. C, 60th Georgia, appears recorded on the Confederate register of Jackson Hospital, Richmond, as having undergone "excision of knee joint" for gunshot wound received August 28, 1862, and as having been "furloughed September 24, 1864."

CASE 637.—Private *E. Bigman*, Co. D, 26th South Carolina, appears recorded on the Petersburg Confederate general hospital as having been admitted August 6, 1864, with "resection of the patella and partial resection of the knee joint," performed by reason of "gunshot wound," and as having "died August 23, 1864."

CASE 638.—Lieutenant *I. M. Dickens*, Co. C, 44th Tennessee, aged 30 years, appears recorded on the register of Confederate hospital No. 4, Richmond, as having received a "shell wound of both patellas and of the left little finger," for which "ablation of the left patella and amputation of the injured finger was performed May 20, 1864." His entrance into the hospital was dated two days after the operation, and his death, preceded by febrile excitement, was noted June 5, 1864.

CASE 639.—Private S. Lininger, Co. H, 74th Indiana, aged 32 years, was wounded at Chickamauga, September 19, 1863. He was admitted to the general field hospital near Chattanooga (date not recorded), where Surgeon J. A. Stillwell, 22d Indiana, noted the following: "Shot wound of right knee joint; excision of internal condyle of femur. Thigh amputated at junction of middle and lower thirds on November 19th. Stump opened and dressed November 23d. Milk punch given freely. November 26th, stump granulating some; resin cerate applied and stump bandaged as tight as it would bear. On November 30th, the sutures all sloughed out; granulations poor. December 6th, patient transferred." Surgeon L. D. Waterman, 39th Indiana, reported that the patient was admitted to the general hospital at Bridgeport, and that he died on the following day, December 7, 1863.

CASE 640.—Private *L. T. Huffman*, Co. E, 57th North Carolina, appears noted on the records of Confederate hospital No. 4, Richmond, as having been admitted December 15, 1862, with "excision of knee joint," performed for shot wound. The result of the operation was not recorded.

AMPUTATIONS AT THE KNEE JOINT.—One hundred and eighty-nine examples of exarticulation at the knee joint[1] for shot fractures are found on the returns. The results of two cases could not be ascertained; eighty-one were followed by recovery, and one hundred and six by death, giving a mortality of 56.6 per cent., thus exceeding the

[1] The operation of amputation at knee joint, mentioned by HIPPOCRATES (*Œuvres complètes*, par É. LITTRÉ, Paris, 1844, T. IV, p. 285) and GUY DE CHAULIAC (*La Grande Chirurgie de* GUY DE CHAULIAC, Rouen, 1615, p. 464), was advocated by J. GUILLEMEAU (*Les Œuvres de Chirurgie*, Rouen, 1649, p. 710) as preferable, under certain circumstances, to amputation in the thigh: "Vray est que si la gangrene, ou fracas d'os, finissoit à la jointure du genoüil ou fort proche d'icelle, sans monter au dessus, comme au commencement de la cuisse, l'amputation se doit plustost faire en la jointure que de coupper plus haut, et principalement en la cuisse: car les accidens en seroient tousiours pires, à raison des vaisseaux, veines, arteres et nerfs, lesquels tant plus on tire et montevers le haut, tant plus sont trouuez gros: joint aussi qu'il conuiendroit appuyer la partie cicatrisee sur la jambe artificielle, comme si on la couppoit à la jointure." The statement of R. B. SABATIER (*Méd. Opératoire*, Paris, 1824, T. IV, p. 548) and others that the operation had been performed by FABRICIUS HILDANUS in 1581, is evidently erroneous. The latter (*Opera quæ extant omnia*, Francofurti, 1646, p. 805) amputated the hand at the wrist joint for shot injury, in a young man of Dusseldorf, in 1581, and adds: "Sin Sphacelus poplitem superarit, in ipsa genu articulatione incisio facienda veniet." Cases of amputation at the knee joint for disease are cited by J. L. PETIT (*Œuvres Complètes*, Paris, 1844, p. 814), BRASDOR (*Essai sur les amputations dans les articles*, in *Mém. de l'Acad. Roy. de Chir.*, Paris, 1774, T. V, p. 771), and others; but the first examples of this operation in military surgery are mentioned by: MICHAELIS (*Briefe aus New York*, in RICHTER'S *Chirurgische Bibliothek*, Göttengen, 1782, B. VI, p. 125), who visited the wounded French in Charleston, left there by Count D'Estaing after his unsuccessful expedition to Savannah, in September, 1779. He found 4 cases of amputations at the knee joint; all proved fatal. The surgeon in charge ascribed these unfortunate results partly to venereal poisoning, partly to scorbutus, and partly to the insalubrious air of Charleston. JOBERT DE LAMBALLE (*Plaies d'armes à feu*, Paris, 1833, p. 293): A. M., aged 15, shot in left leg July 28, 1830; amputation at the knee joint two months after injury. VELPEAU (*Nouveaux Éléments de Médecine Operatoire*, Paris, 1839, T. II, p. 521) states that disarticulation of the leg had been successfully practised once since 1830, by M. NIVERT, of Azai-le-Rideau, on a man whose leg had been fractured by shot. BAUDENS (L.) (*Clinique des plaies d'armes à feu*, Paris, 1836, pp. 532, 536): A soldier, wounded at Tafna, January 26, 1836, in right knee; patella shattered; ball lodged in condyle of femur; amputation through joint; portion of condyles removed; recovery, with serviceable stump. A soldier of the 13th regiment, wounded April 1, 1836, at Atlas; fracture of the head of the tibia; amputation through joint; recovery. SÉDILLOT (G.) (*Campagne de Constantine de* 1837, Paris, 1838, p. 266) tabulates 3 fatal cases of exarticulation at the knee for shot injuries. SMITH (STEPHEN) (*Cases in Surgery—Amputation at the Knee Joint*, by W. PARKER, in *New York Jour. of Med.*, 1852, Vol. IX, p. 318): A saddler, shot in the leg; amputation at the knee joint with a razor, the surgeon having no other instrument; recovery with a good stump, which was tender on pressure. Dr. I. MOSES (T. M. MARKOE, *Amputation at the Knee Joint—Illustrated by the Cases which have occurred in American practice, and mainly by those which have been treated in the New York Hospital*, in *The New York Jour. of Med.*, 1856, Vol. XVI, p. 30) operated in the case of J. Senno, a Mexican, aged 26, who had received a shot fracture of the left tibia in June, 1854; amputation at the knee November 22, 1854; recovery, with firm stump, in six weeks. MAZANOWSKY (JOSEPH) (*Zur Exarticulation im Kniegelenke*, in LANGENBECK'S *Archiv für Klin. Chir.*, 1866, B. VII, S. 489): Osman Babassy, aged 25, wounded in the Crimea, July 17, 1854; fracture of bones of both legs; January 30, 1855, exarticulation at knee joint after BAUDENS; recovery. CHENU (J. C.) (*Rapport, etc., pendant la Campagne d'Orient en* 1854-55-56, Paris, 1865, p. 416) tabulates 67 cases of amputation at the knee joint; 5 were successful and 62 proved fatal. The successful cases are: J. P. Bernad, 80th line, shot fracture of left leg, September 8, 1855; primary disarticulation. A. A. Boullier, 97th line, shot fracture of right leg, June 7, 1855; primary amputation at the knee. J. N. Dewatine, 82d line; shot comminution of right leg, September 20, 1854, at the Alma; amputation on the same day. L. A. Roudil, 3d Zouaves; shot fracture of right leg at Inkerman, November 5, 1854; exarticulation at knee. J. B. Sainpy, 26th line, shell fracture of left leg, September 8, 1855; primary exarticulation. MATTHEW (T. P.) (*Med. and Surg. Hist. of the British Army in the years* 1854-55-56, London, 1858, Vol. II, p. 368) tabulates 7 amputations at the knee joint; 3 were successful and 4 fatal; the 3 successful cases were all primary; of the 4 fatal cases, 3 were primary and 1 secondary. CHENU (J. C.) (*Stat. Méd.-Chir. de la Camp. d'Italie en* 1859 *et* 1860, Paris, 1869, T. II, p. 775) tabulates 4 cases of amputations at the knee occurring in the French army during the campaign in Italy in 1859-60; 1 recovered, 3 died. The instance of recovery is detailed: L. Dumas, 37th line, comminuted fracture of upper third of left leg, Solferino, June 24, 1859; amputation at the knee December 19, 1859; recovery, with good stump, February 25, 1860. The same author states that

fatality of amputations in the continuity of the femur by 2.8 per cent. One hundred and eight were primary operations, fifty-one intermediary, and twenty-six secondary, while in four instances the period of operation was not indicated:

TABLE LIV.

Summary of One Hundred and Eighty-Nine Amputations at the Knee Joint for Shot Fracture.

OPERATIONS.	CASES.	RECOVERY.	DEATH.	UNDETERMINED.	MORTALITY RATE OF DETERMINED CASES.
Primary	108	50	57	1	53.2
Intermediary	51	16	34	1	68.0
Secondary	26	12	14	.....	53.8
Time not specified	4	3	1	.....	25.0
Aggregates	189	81	106	2	56.6

Fifty-four of the one hundred and eighty-nine exarticulations[1] at the knee were performed for lesions of the bones of the knee joint. In the remaining one hundred and thirty-five cases the original injuries were: Fractures of one or both bones of the leg in one hundred and sixteen, fractures of the ankle joint in thirteen, and fractures of the bones of the foot in six instances.

Primary Amputations at the Knee Joint.—Of one hundred and eight operations of this group, fifty were followed by recovery, fifty-seven by death, and, in one instance, the final result could not be determined. The mortality rate, 53.2 per cent., exceeds that of the primary amputations in the lower third of the thigh (TABLE XXIX, p. 213) 4.5 per cent., and that of the primary operations in the thigh, whether in the upper, middle, or lower thirds, 3.2 per cent.

Recoveries after Primary Amputations at the Knee Joint.—Thirty-eight of the fifty successful primary operations were performed on Union, and twelve on Confederate soldiers. Thirty-seven of the thirty-eight Union soldiers became pensioners, and six have since died, one, one year; one, two years; one, five years; two, sixteen years; and one, eighteen years

3 amputations at the knee were performed on Austrian soldiers; all proved fatal. According to B. BECK (*Kriegs-Chirurgische Erfahrungen während des Feldzuges*, 1866, Freiburg, i. B., 1867, p. 340), the operation was successfully performed in 1866, in Würzburg, by LINHART. OTIS (G. A.) (*A Report of Surgical Cases treated in the Army of the United States from* 1865 *to* 1871, *Circular* No. 3, War Department, S. G. O., Washington, 1871) records 2 successful operations: Pt. T. Nipple, 3d Cavalry; March 31, 1870, pistol ball wound of right knee, perforating head of tibia; May 3, amputation through knee joint, sawing off about an inch of the condyles after the manner of Mr. CARDEN, of Worcester, by Ass't Surgeon J. D. HALL, U. S. A.; recovered, with a well rounded stump. Pt. L. Shire, 3d Cavalry; wounded by Apache Indians October 6, 1870; ball embedded itself in internal condyle of left femur; October 11th, amputation, sawing off about an inch of the condyles, by Ass't Surgeon J. D. HALL, U. S. A.; recovery, with a good stump. CHENU (J. C.) (*Aperçu Hist. Stat. et Clin, etc., pendant la guerre de* 1870–71, Paris, 1874, T. I, p. 493) tabulates 23 amputations at the knee; 5 were successful and 18 fatal. BECK (B.) (*Chirurgie der Schussverletzungen*, 1872, p. 852): U. O. L., 43d East Prussian Infantry; shot fracture of both bones of right leg January 15, 1871; exarticulation at knee joint January 23, 1871; periostitis of femur; recovery in 6 weeks; stump not well covered. FISCHER (G.) (*Dorf Floing und Schloss Versailles*, in *Deutsche Zeitschrift für Chirurgie*, 1872, B. I, p. 187) tabulates 1 secondary amputation at the knee joint; the result is not stated. GRAF (E.) (*Die Königlichen Reserve-Lazarethe zu Düsseldorf während des Krieges*, 1870–71, Elberfeld, 1872, p. 53): Martinet, shot fracture of fibula; exarticulation at knee by BÜCHNER; death. LOSSEN (H.) (*Kriegschirurgische Erfahrungen*, in *Deutsche Zeitschrift für Chirurgie*, 1873, B. II, p. 137) mentions a case of successful primary exarticulation at the knee. SOCIN (A.) (*Kriegschirurgische Erfahrungen*, Leipzig, 1872, p. 153) tabulates 3 fatal cases of amputation at the knee joint, but gives no details. Of the 128 cases referred to in this note 25 recovered, 102 died, and the result in 1 case is undetermined; 11 were primary, 2 intermediary, 7 secondary, and 108 were operations of undetermined date.

[1] To these 189 cases of amputation at the knee joint for shot fractures should be added 6 exarticulations for shot flesh wounds, cited in the first section of this Chapter, on page 56, making a total of 195 cases, with 82 recoveries, 111 deaths, and 2 undetermined results. In an article by Dr. J. H. BRINTON, *On Amputation at the Knee Joint and at the Knee*, in *The Am. Jour. of the Med. Sci.*, April, 1868, Vol. LV, p. 311, occurs the following: "In a communication from Surgeon OTIS, received since the preceding pages were penned, the following additional information has, with the permission of the Surgeon General, been furnished to the writer. The whole number of cases of knee joint amputations recorded in the Surgeon General's Office is two hundred and eleven. Of these, ninety-six recovered, one hundred and six died, one is still under treatment, and in eight the result is undetermined." This information was furnished to Dr. BRINTON in the early part of 1868, when every moment of the editor's time was occupied with the analysis of the injuries of the head, and when, with the limited clerical assistance at his command, it had only been possible to examine into the details of such cases as were under immediate discussion. Although there were entered on the records at that time 211 cases of alleged exarticulations at the knee, it has been ascertained from subsequent careful analysis and comparisons, and from additional information gathered from artificial limb statements and pension records, that 16 of these 211 cases were, in reality, amputations of the femur immediately above the condyles. The editor exceedingly regrets to have been the cause of this, although unavoidable, erroneous statement in Dr. BRINTON'S excellent paper on knee joint amputations.

after the exarticulation at the knee. In one instance, the case of Corporal Lapham, 1st Vermont Cavalry, detailed on page 224, *ante*, the opposite thigh was simultaneously removed at the middle third; in six instances the exarticulation was followed by amputation in the thigh, viz: four in the lower and two in the middle thirds.

CASE 641.—Private L. J. Matson, Co. K, 2d New York Cavalry, aged 21 years, was wounded at Petersburg, April 1, 1865. Two days after the reception of the injury he was admitted to the Depot Hospital at City Point, whence he was forwarded to Washington. Surgeon R. B. Bontecou, U. S. V., contributed a photograph of the wounded man (*Contrib. Photo's*, S. G. O., Vol. VIII, p. 21), with the following history: "The patient was admitted to Harewood Hospital, April 5th, suffering from amputation at the left knee joint, which was performed on the field by the antero-posterior flap method, for shot wound of the leg involving injury to the knee joint. The operator and the extent of the injury were unknown. At the time of admission the condition of the stump and the constitutional state of the patient were tolerably good. The parts subsequently became gangrenous; but by timely application of escharotics, and by supporting treatment throughout, the patient did well and made fair progress in his recovery. A part of the femur was removed with the dressing forceps." The patient subsequently passed through Lincoln and Armory Square Hospitals, and on September 2, 1865, he was discharged from service, and furnished with an artificial limb by the Jewett Patent Leg Company. The pensioner was paid December 4, 1879. In his application for commutation he represented the stump as being in a sound condition.

CASE 642.—Private R. Kelly,[1] Co. A, U. S. Engineer Battalion, aged 23 years, was wounded in the left knee by one of the sharpshooters in front of Petersburg, August 18, 1864. Assistant Surgeon G. M. McGill, U. S. A., reported: "The ball entered somewhat to the left of the median line, near the tuberosity of the tibia, passed upward and backward, and lodged in the face of the external condyle, partially embedding itself crosswise. On consultation with Surgeon J. R. Ghiselin and Assistant Surgeon J. R. Gibson, U. S. A., and Acting Assistant Surgeon B. F. Goodrich, who had charge of the case, it was decided to amputate through the knee joint. I introduced a scalpel opposite the termination of the external condyle and outlined an anterior flap—the lowermost part of which was two inches below the terminal insertion of the quadriceps extensor—with a firm cut that divided the skin and the superficial fascia: terminating the primary incision of the anterior flap opposite a point of the internal condyle corresponding to the point of introduction opposite the external condyle. From this termination the scalpel was reversed and the inner half of the posterior flap formed, the depth of my incision being sufficient to insure section of the superficial fascia as well as the skin proper. The knife was then removed and reinserted near the original point of entrance from which the outer half of the posterior flap was formed. This posterior flap was very long, extending fully half way down the leg, and the angles of the union of the anterior and posterior lines of incision were made very acute, so that retraction would not tend to separate the angles of the stump by drawing the sac of the stump tightly over the large extent of bone substance left. The anterior flap was now raised, and in raising it I took care to dissect so as to inflict as little injury as possible to the superficial fascia. The ligament of the patella was incised closely above the tuberosity of the tibia, and the patella, with its connections, was left untouched so far as practicable. The ligaments remaining were then divided at their insertion and so cut through that the semilunar cartilages remained in the stump. All the ligaments having been thus severed, I cleared the posterior flap with a large operating knife, cutting in the plane of the retracted posterior skin flap, outlined as described above. This procedure afforded a base of flesh to what was essentially a skin flap, in addition to which I found that by the method adopted the fleshy part of the posterior flap had been so formed as to expose so much of the anterior surface of the deep posterior layer of crural fascia that a fibrous sheet fitted upon the synovial surfaces exposed by the removal of the tibia. I now cut away all points and strips of cartilage or fibrous tissue accidentally made in operating. The ball was elevated from its bed in the face of the external condyle and this bed cleared. Nothing unusual took place in the subsequent steps of the operation; unfortunately, however, the silk ligature threads used were rotten. There was also a ball hole in the anterior flap besides the wound in the face of the condyle to complicate the case. The latter was oozing blood from its sides when last observed. Throughout the operation any injury to what was left of the synovial sac was avoided. September 9th, patient is doing very well; none of the ligatures have yet come away, and gentle traction met with firm resistance this morning. The patient is afflicted with pains of a darting lancinating character, shifting in location. The wound of entrance in the outer border of the anterior flap has healed rapidly by granulation, and to a great extent the flaps have united. A sinus, the mouth of which is to the right of the middle of the cicatricial line, communicates with the bed of the ball; but so little discharge takes place through this that the bed is thought to be already filled with callus. A peculiar 'leaden' feeling about the patella has been observed by the patient. He is not able to move this bone, but moves the thigh without pain. September 14th, patient is doing finely. One of the ligatures on the inside, that of an articular artery, has broken off short. The popliteal ligature has not yet separated. September 22d, the patient has steadily improved. The tumor of the stump has subsided and the line of the cicatrix is somewhat depressed. There is still discharge from where the ligature is broken off, and it is probable that the knot of this ligature will remain in the stump for some time. The main ligature has not yet come away; the thread being fine and rotten, I dreaded to pull it even gently. The patella is now freely movable up and down, to the right and left. The capsule of the joint, as a whole, has adhered strongly to the condyloid surfaces of the femur, and affords a sufficient stay to the connected muscles. On September 27th, the patient was sent away to West Point, New York. He was then able to walk on crutches, and I had only to regret that knots of all the ligatures remained in the stump, having considered it inexpedient to search for them. On his way to West Point the patient—as he informed me by letter—was attacked with what he termed gangrene, rendering some operation necessary, which, I believe, was performed at West Point. From his description of it I understood that this operation did not extend to interference with the bone or the remains of the synovial sac." Surgeon J. F. Head, U. S. A., certified to the patient being treated in hospital at West Point. The man was discharged by expiration of service, January 23, 1865, and pensioned, and after reaching his home he was supplied with an artificial limb by the Palmer Arm and Leg Company. The Brooklyn Examining Board, December 16,

[1] Abstracts of this case have been cited by MARKOE (T. M.), *Amputation at the Knee Joint*, in *New York Medical Journal*, 1868, Vol. VI, p. 503, CASE XXXII, and in *Circular* No. 3, War Department, S. G. O., Washington, 1871, p. 278.

1874, certified to the amputation, and to the patella being unremoved and remaining embedded in the extensor muscles of the anterior surface of the stump; also to the integuments being adherent to the stump and parts so thin that an artificial limb can be worn but little of the time without creating inflammation. The pensioner was paid December 4, 1879.

CASE 643.—Private E. Baker, Co. A, 38th Wisconsin, aged 17 years, was wounded in the right leg, before Petersburg, July 17, 1864, and admitted to the field hospital of the 3d division, Ninth Corps. Surgeon M. K. Hogan, U. S. V., recorded: "The ball entered at the outer tuberosity of the tibia, ranged inward and slightly upward, and embedded itself between the tuberosities. The synovial membrane was lacerated and synovia escaped. The leg was amputated by Surgeon A. F. Whelan, 1st Michigan Sharpshooters, the operation being performed on Butcher's plan." From the field hospital the wounded man was moved to City Point, and thence to Philadelphia. Surgeon S. J. W. Mintzer, U. S. V., reported that "the patient was admitted to South Street Hospital, July 26th, his right leg having been amputated on the field, on the day following the injury, at the knee joint, and the patella removed. When admitted, parts of the integuments had sloughed away, leaving the extremity of the bone exposed. On July 30th, hæmorrhage occurred without much loss of blood, from which the patient rallied, though much weakened by diarrhœa. A narrow semicircle of bone was removed, after which granulations began to cover it. There was considerable suppuration from the depth of the posterior flap." About eight months afterwards the patient was supplied with an artificial limb, and on May 30, 1865, he was discharged from service. The pensioner was paid December 4, 1879. In his application for commutation he stated that the stump of his amputated limb remained in good condition.

Fatal Cases of Primary Amputation at the Knee Joint.—Fifty-seven cases were reported; in fifty-one instances the patients were Union, and in six Confederate soldiers. Seven deaths were referred to pyæmia, two to tetanus, three to hæmorrhage, one to gangrene, one to typhoid fever, and seventeen to exhaustion. The average period between the day of the operation and the date of death was forty-one days.

CASE 644.—Private W. Stanley, Co. H, 53d Pennsylvania, aged 26 years, was wounded at Fredericksburg, December 13, 1862. He was admitted to a Second Corps field hospital, and thence transferred to Washington. Assistant Surgeon C. C. Lee, U. S. A., reported: "The patient entered Douglas Hospital December 26th, having received a comminuted fracture of the upper third of the right leg, for which amputation through the knee joint was performed the following day. He stated that hæmorrhage was profuse both before and since the amputation. The stump sloughed somewhat and did badly. On March 1, 1863, when I took charge of the case, the stump was tightly bandaged from above downward, the extremities being swollen and bulbous, and the thigh completely honeycombed in appearance by small abscesses and sinuses for six inches above the condyles. The bandage was removed and the sinuses and abscesses laid open. The patient was also greatly enfeebled by chronic diarrhœa, from which he had suffered for six months, and which, though checked from time to time, always returned with full force. In this state he vacillated from better to worse until April 20th, when, without any ostensible cause, he was seized with obstinate nausea and vomiting. This resisted every means employed to remedy it and exhausted what little strength remained in the patient. He sank steadily until the night of April 26, 1863, when he expired of sheer debility. At the autopsy, the thoracic viscera were found healthy with the exception of old pleuritic adhesions on the right side; lungs crepitant throughout and without tubercular deposit. The liver and kidneys were shrunken and showed evidence of chronic congestion, but were otherwise normal; stomach and spleen healthy. In the large intestines well-marked congestion was observed and partial maceration of the mucous membrane, which was here and there dotted with dark maculæ. These spots were surrounded by depressions and apparent cicatrices in the mucous membranes, and were thought to be the result of ulcers that had already cicatrized. The condition described was chiefly noticed in the upper portion of the rectum. The small intestines were here and there greatly congested, but no ulceration was detected. The stump had healed completely; but from the removal of the patella in the operation and the subsequent emaciation of the patient the edges of the condyles were too superficial to have borne pressure with success. A large abscess, which had been very troublesome during life, existed between the rectus and cruræus muscles. The latter was wasted to the last degree, but seemed to have protected the bone, which was not diseased. A very complete calcareous degeneration of the mesenteric glands should also have been noted above." The lowest portion of the femur was saved and contributed to the Museum by Assistant Surgeon W. Thomson, U. S. A. (*Cat. Surg. Sect.*, 1866, p. 363, *Spec.* 1240.)

CASE 645.—Major A. McQ. Corrigan, 9th New York Cavalry, aged 27 years, was wounded in the right leg, at Meadows Bridge, May 12, 1864. Surgeon A. P. Clark, 6th New York Cavalry, described the injury as follows: "At the time of receiving the wound he was in command of a detachment of his regiment and at a considerable distance in advance, endeavoring to force the enemy from his entrenchments on the other side of the bridge, when he was struck by a conical musket ball, which passed from the anterior to the posterior aspect of the limb, fracturing the upper extremity of the tibia and wounding the anterior tibial artery. The hæmorrhage was, in a measure, controlled by the men who brought the patient a short distance to the rear, where a tourniquet was applied. A few minutes afterwards the enemy was dislodged, when orders were received for the troops to cross as speedily as possible, and the train was not allowed to halt until it reached Mechanicsville, five miles distant, where Acting Assistant Surgeon C. Rodgers, assisted by another medical officer and myself, amputated the leg at the knee joint, adopting the method of double flaps and removing the patella and a section of the condyles of the femur. The patient was then placed in an ambulance and taken to Haxall's Landing, which place was reached on May 15th, and whence he was sent by water to general hospital." Acting Assistant Surgeon T. Liebold communicated the following termination of the case: "The patient was admitted to Point Lookout Hospital May 16th. The stump was much inflamed and the pus retained by sutures, which were removed. Two days after his admission, secondary hæmorrhage came on at noontime. Happening to be near at the time I was enabled to stop it immediately, so that not more than from four to six ounces of blood was lost. The stump was then opened again entirely and the anterior tibial artery, from which the ligature had come off, was religated in a few minutes by Surgeon A. Heger, U. S. A., in charge of the hospital. The patient died May 28, 1864, from exhaustion, having had severe diarrhœa and profuse discharge of pus from an abscess in the stump. He was also attacked with vomiting of bile."

TABLE LV.

Summary of One Hundred and Eight Cases of Primary Amputation at the Knee Joint for Shot Fracture.

[Recoveries, 1–50; Deaths, 51–107; Result unknown, 108.]

No.	Name, Military Description, and Age.	Date of Injury.	Nature of Injury.	Date of Operation.	Operation and Operator.	Result and Remarks.
1	Baker, E. V., Pt., A, 38th Wisconsin, age 17.	July 17, 1864.	Rifle ball fracture of bones of right leg, involving knee.	July 18, 1864.	Flap; remov'g patella; Butcher's operation, by Surg. A. F. Whelan, 1st Mich. S. S.	July 30th, hæm. Semicircle of bone removed. Disch'd May 30, 1865.
2	Becker, H., Serg't, F, 5th Mich. Cavalry, age 27.	July 3, 1863.	Conoidal ball comminuted head of left tibia.	July 4, 1863.	Antero-posterior flap.....	Stump heal'd by first inten. Disch. Dec. 14, '63. (Also fract. jaw.)
3	Begle, G., Pt., E, 91st Indiana, age 22.	Aug. 3, 1864.	Conoidal ball fracture of left leg, involving knee joint.	Aug. 3, 1864.	Flap; thro' condyles of femur, by Surg. J. T. Woods, 99th O.	Stump perfectly healed. Disch. June 21, 1865.
4	*Bowen, H.*, Pt., K, 52d North Carolina.	July 3, 1863.	Shot fracture of left leg. (Also wound of right ankle.)	July 3, 1863.	Amputation at knee joint.....	Recovery, January 12, 1864.
5	Bragg, W., Serg't, F, 8th Penn. Cavalry, age 23.	May 27, 1864.	Conoidal ball fracture of left tibia.	May 27, 1864.	Flap amputation, by Assistant Surg. H. G. Chritzman, 8th Penn. Cavalry.	Discharged April 6, 1865.
6	Brooks, J. M., Pt., A, 17th Penn. Cavalry, age 28.	June 21, 1863.	Cannon shot fracture two ins. below left knee joint, severing leg.	June 21, 1863.	Amputation at knee joint.....	Sept. 10, amp. lower third thigh. Disch'd July 28, 1865. (TABLE XL, No. 14, p. 320.)
7	Credon, J., Pt., A, 91st New York, age 45.	May 27, 1863.	Musket ball comminuting left patella and opening knee joint.	May 27, 1863.	Ant. and post. flaps; one half of patella retained, by A. Surg. J. T. Myers, 91st New York.	September 1st, entirely healed. Discharged Mar. 29, 1866. The stump is tender.
8	Darkes, J., Pt., B, 10th Infantry, age 33.	Aug. 19, 1864.	Disrupture of left leg at upper third by a solid shot.	Aug. 20, 1864.	Anterior rectangular flap amputation, involving patella, lateral and inferior surfaces of condyles, by Surg. A. A. White, 8th Maryland.	August 30, gangrene. To regimental headquarters Dec. 17, 1864. Stump healed.
9	David, T., Pt., A, 90th Pennsylvania, age 27.	Dec. 13, 1862.	Shot fracture of right tibia and fibula, upper third.	Dec. 13, 1862.	Flap amputation at knee, retaining patella and condyles, by Ass't Surg. C. C. Lee, U. S. Army.	Disch'd Feb. 21, 1863. Died Feb. 25, 1870. BRINTON (J. H.), *On Amp. at the Knee Joint, etc.*, in *Am. Jour. Med. Sci.*, 1868, Vol. LV, p. 324.
10	Dow, G. E., Pt., G, 12th N. Hampshire, age 22.	June 3, 1864.	Grape shot fracture of left leg.	June 3, 1864.	Flap amputation at knee joint.	June 23d, hæm.; 24th, lig. fem. artery. Disch'd Nov. 18, 1864.
11	Everett, J., Serg't, G, 142d Pennsylvania, age 27.	May 23, 1864.	Conoidal ball fracture of right tibia and fibula.	May 24, 1864.	Lateral flap; patella retained; a small section of condyles size of a half dollar remo'd, by Surg. J. Ebersole, 19th Ind.	Discharged January 22, 1865. *Spec.* 4857.
12	Freeman, C., Pt., B, 210th Pennsylvania, age 32.	Mar. 31, 1865.	Conoidal ball fracture and great splintering of patella and tibia of left leg.	April 1, 1865.	Antero-posterior flap; removing patella, by Surg. J. J. Comfort, 190th Penn.	Discharged Aug. 3, 1865; good stump.
13	Gallot, E. F., Pt., E, 146th New York, age 26.	June 2, 1864.	Conoidal ball comminuted fracture of upper third of left leg.	June 3, 1864.	Antero-posterior flap, by Surg. La Grange, C. S. A.	Discharged January 20, 1865. Healthy stump.
14	Hare, F., Corp'l, B, 6th Wisconsin, age 23.	May 5, 1864.	Shot fracture of bones of left leg.	May 6, 1864.	Amputation at knee joint, by a Confederate surgeon.	Gang. Aug. 6, re-amp. mid. th'd thigh. Disch'd May 22, 1865. (TABLE XXXIX, No. 39, p. 314.)
15	Harkins, J. B., Pt., K, 119th Pennsylvania, age 22.	Dec. 13, 1862.	Shot wound of the left leg.....	Dec. 13, 1862.	Amputation at knee joint, by Surgeon J. P. Leidy, 119th Pennsylvania.	Disch'd Mar. 19, 1863. Diseased stump; violent neuralgia; hectic fever; exhausting diarrhœa. Died May 19, 1867.
16	Heinle, J., Pt., G, 51st Pennsylvania, age 23.	June 3, 1864.	Shell wound of right leg, upper third.	June 3, 1864.	Flap; by Surg. A. F. Whelan, 1st Michigan S. S.	Discharged June 1, 1865. Died May 1, 1870.
17	Herbert, C., Pt., C, 69th N. York, age 19. (Alias Chas. St. J. Nichols.)	Aug. 25. 1864.	Two shot wounds of right leg by conoidal balls, fracturing heads of both bones and their lower thirds.	Aug. 27, 1864.	Long posterior flap, by a Confederate surgeon.	Discharged June 9, 1865. Cannot wear an artificial limb.
18	Hopkins, W., Pt., E, 6th Michigan Cavalry, age 32.	Sept 16, 1863.	Conoidal ball penetrating cavity of left knee joint.	Sept. 17, 1863.	Amputation at knee joint, by a Confederate surgeon.	Sound stump. Disch'd March 23, 1864.
19	*Howard, J. W.*, Corp'l, D, 61st Virginia.	May 12, 1864.	Shot wound of knee joint.....	May 12, 1864.	Amputation at knee joint.....	Recovery.
20	Ivey, A., Serg't, D, 7th Wisconsin, age 26.	July 1, 1863.	Shot fracture of upper third of left tibia.	July 1, 1863.	Bi-lateral skin flap, by Surg. J. Ebersole, 19th Indiana.	Discharged May 14, 1864.
21	*Jones, H. C.*, Lieut., E, 15th Virginia.	May 16, 1864.	Shot wound of knee joint.....	May 16, 1864.	Amputation at right knee joint.	Recovery.
22	*Karnes, W. H.*, Pt., G, 11th Virginia Cav., age 40.	June 9, 1863.	Conoidal ball fracture of head of left tibia.	June 10, 1863.	Amputation left knee joint, by a Union surgeon.	Exchanged and furloughed Mar. 12, 1864.
23	Knul, J., Pt., G, 29th New York, age 21.	Aug. 29, 1862.	Musket ball perforated head of right tibia; joint not involved.	Aug. 29, 1862.	Double flap amputation.....	Mar. 12, 1863, patella raised and movable. Disch'd April 30, '63. Died Dec. 13, 1878; dropsy.
24	Kelly, R., Artificer, U. S. Engineers, age 23.	Aug. 18, 1864.	Conoidal ball entered near tuberosity of left tibia, lodging on external condyle of femur, slightly injuring it.	Aug. 18, 1864.	Antero-posterior flaps; patella not removed, by Ass't Surg. G. M. McGill, U. S. A.	Disch'd Jan. 23, 1865. MARKOE (T. M.), *Amp. Knee Joint*, in *N. Y. Med. Jour.*, 1867–68, Vol. VI, p. 503. Stump tender.
25	Kerr, G., Serg't, H, 2d Cavalry, age 41.	June 11, 1864.	Conoidal ball wound of upper third of right leg.	June 11, 1864.	Amputation at knee joint, by Union surgeon.	Disch'd October 17, 1864. Died 1865.
26	Kuhn, A., Pt., F, 99th Ohio, age 28.	July 19, 1864.	Conoidal ball comminuted fracture of right tibia, extending nearly to knee joint.	July 19, 1864.	Short flap, leaving condyles of femur intact, by Surg. J. T. Woods, 99th Ohio.	Discharged June 21, 1865.
27	Lapham, C. N., Corp'l, K, 1st Vermont Cavalry, age 23.	July 8, 1863.	Both legs carried away by a solid shot.	July 10, 1863.	Amputation left knee joint by ant.-post. flap (also amp. right thigh, middle third), by Surg. L. P. Woods, 5th N. Y. Cav.	Disch'd August 25, 1864. (CASE 436, p. 224, and No. 336, TABLE XXXI, p. 231.)
28	*Leonard, W. J.*, Pt., K, 43d Alabama, age 20.	May 16, 1864.	Shot comminution of tibia and fibula just below knee joint.	May 16, 1864.	Antero-posterior flap; removing patella.	Recovered July 31, 1864.
29	Matson, L. J., Pt., K, 2d N. York Cavalry, age 21.	April 21, 1865.	Conoidal ball wound of left leg, injuring knee joint.	April 1, 1865.	Antero-posterior flap amputation.	Gangrene; sloughing. Portion of femur removed with forceps. Discharged Sept. 2, 1865.
30	McGee, J., Pt., G, 2d Rhode Island, age 22.	May 5, 1864.	Conoidal ball fracture of right tibia and fibula.	May 5, 1864.	Short post. flap; patella remo'd. by Surg. G. W. Carr, 2d R. I.	Discharged Oct. 15, 1864. Stump never healed entirely.
31	*McMullen, R. J.*, Pt., I, 4th Georgia, age 20.	May 3, 1863.	Shot fracture of the leg.....	May 4, 1863.	Amputation at knee joint.....	Protrusion of condyle. May 23d, amp. thigh, lower third. June 5th, hæm.; lig. femoral artery. Recovery. (TABLE XXXVI, No. 130, p. 295.)

No.	Name, Military Description, and Age.	Date of Injury.	Nature of Injury.	Date of Operation.	Operation and Operator.	Result and Remarks.
32	*Mitchell, A.*, Pt., F, Palmetto S. S., age 17.	May 24, 1864.	Shot wound of the upper extremity of tibia.	May 25, 1864.	Amputation at knee joint.....	Slough'g; both condyles exposed. Furloughed Sept. 10, 1864.
33	Muir, L., Pt., I, 5th Vermont, age 25.	May 5, 1864.	Shot fracture of left leg four inches above ankle.	May 6, 1864.	Circular amputation at knee joint.	Discharged May 22, '65. Stump enlarged; cannot use artif. leg.
34	O'Brien, P., Pt., F, 39th N. York, age 27.	Aug. 14, 1864.	Conoidal ball fracture of left tibia two ins. below knee j't.	Aug. 15. 1864.	Flaps, by Surg. N. Hayward, 20th Mass.	Discharged June 19, 1865. Died August 11, 1866.
35	Pace, H., Pt., G, 143d Pennsylvania, age 33.	May 5, 1864.	Conoidal ball fract. of articulating surface head of right tib.	May 5, 1864.	Skin flaps, by Surg. J. Ebersole, 19th Indiana.	Discharged August 31, 1864.
36	Padgett, C. S., Serg't, K, 12th New Jersey, age 23.	June 3, 1864.	Conoidal ball comminuted fracture of right tibia and fibula. (Also fracture of left radius.)	June 4, 1864.	Antero-post. flaps; retaining patella but removing articular surface of condyles, by Surg. A. Satterthwaite, 12th N. J.	Discharged July 13, 1865. BRINTON (J. H.), *Am. Jour. Med. Sci.*, 1868, Vol. 55, p. 322.
37	*Raftay, P.*, Pt., C, 21st Mississippi, age 40.	May 6, 1864.	Shot wound of left knee.....	May 6, 1864.	Amputation at knee joint.....	Retired January 31, 1865.
38	Rist, C. H., Pt., A, 36th Wisconsin, age 19.	June 1, 1864.	Conoidal ball fracture of upper third of left tibia, extending into knee joint.	June 1, 1864.	Osteoplastic, leaving patella and condyles, by Surg. J. M. Burr, 42d New York.	Ulceration of cartilages. Dec. 15, amp. thigh, lower third. Discharged May 20, '65. *Spec.* 3514. (CASE 492, p. 318, and TABLE XL, No. 82, p. 321.)
39	Rogers, J. W., Pt., D, 6th Wisconsin, age 47.	Aug. 18, 1864.	Conoidal ball fracture of left tibia and fibula immediately below knee.	Aug. 19, 1864.	Flap amputation at knee joint.	Bone protruded. Disch'd March 23, 1865.
40	Sholes, H., Pt., D, 26th New York, age 20.	Dec. 13, 1862.	Shot wound of right knee	Dec. 15, 1862.	Amputation, by Surg. T. Sim, U. S. V.	Gang. March, 1863, amp. thigh, low. third. Disch'd Dec. 11, '63. (TABLE XL, No. 84, p. 321.)
41	Stewart, W., Pt., K, 2d Michigan, age 22.	June 17. 1864.	Shell wound just below right knee, nearly severing leg.	June 17. 1864.	Antero-posterior flaps; removing patella and condyles, by Surg. S. S. French, 20th Mich.	Sloughing. Discharged May 4, 1865. Tender cicatrix.
42	Stratton, E. L., Capt, F, 12th New Jersey, age 24.	May 3, 1863.	Conoidal ball fracture of head of right tibia.	May 4, 1863.	Amputation knee joint, leaving patella intact, by Ass't Surg. J. T. Calhoun, U. S. A.	Discharged January 3, 1864.
43	Struble, E. H., Pt., F, 19th Ohio, age 25.	May 22, 1862.	Shell, taking off left leg below knee.	May 22. 1862.	Flap amputation, by Surg. F. T. Hurxthal, 19th Ohio.	Discharged March 16, 1863.
44	*Swittenburg, J. C.*, Capt., H, 16th Miss., age 27.	Aug. 21, 1864.	Conoidal ball shattering upper third left leg.	Aug. 21, 1864.	Amputation at knee joint, by Surg. J. Ebersole, 19th Ind.	Exchanged February 23, 1865.
45	*Trent, S. A.*, Pt., 2d Richmond Howitzers.	May 12, 1864.	Gunshot wound of knee	May 12. 1864.	Amputation at knee joint, by Surg. — Capers, C. S. A.	Retired November 5, 1864.
46	*Turner, J. L.*, P., G, 1st S. Carolina, age 20.	July 1, 1863.	Shell wound of right leg, involving knee joint.	July 2, 1863.	Amputation at knee joint.....	Exchanged March, 3, 1864.
47	Unknown, age about 30.	Dec. 13, 1862.	Shot fracture of the leg.....	Primary	Long ant. and short post. flaps: patella and condyles retained, by Surg. J. H. Brinton, U. S. V.	Recov'd, with good stump. BRINTON (J. H.), *On Amp. at the Knee Joint, etc.*, in *Am. Jour. Med. Sci.*, 1868, Vol. LV, p. 316.
48	Wheeler, T. H., Serg't, E, 1st Mich. Cav., age 32.	May 31, 1864.	Shot wound of right tibia and fibula, implicating knee joint.	May 31, 1864.	Flap amputation, by Surg. G. K. Johnson, 1st Mich. Cav.	June 10th, gangrene. Disch'd Nov. 12, 1864.
49	Woodruff, A. O., Corp'l, D, 5th Artillery, age 23.	July 3, 1863.	Conoidal ball fracture of upper third of left tibia. (Also wound of right leg.)	July 3, 1863.	Amputation, by Ass't Surg. B. Howard, U. S. A.	Discharged May 28, 1864. Poor stump, with very thin covering.
50	*Young, L. C.*, Pt., A, 3d Virginia Cavalry, age 31.	May 12, 1864.	Pistol ball injuring both right tibia and femur, involving the knee joint.	May 14, 1864.	Long anterior flap, by Surg. C. B. Gibson, C. S. A.	July 27th, amp. thigh, mid. third; gangrene; recovery. *Spec.* 5514. (TAB. XXXIX, No. 100, p. 315.)
51	*Barger, J. C.*, Pt., G, 52d Virginia, age 40.	May 30, 1864.	Shot wound right leg and left shoulder.	Primary	Amputation at knee joint.....	Died June 14, 1864.
52	Barker, J., Pt., I, 58th Mass., age 42.	June 17, 1864.	Shot wound left leg and right thigh.	June 17. 1864.	Oval flap amput'n at left knee and amp. low. third r't thigh.	Died June 28, 1864. (TABLE XXXII, No. 1014, p. 257.)
53	Bates, O. S., Pt, A, 20th Mass., age 24.	June 24, 1864.	Shell fracture of middle third of left leg.	June 24. 1864.	Antero-posterior flap, at left knee joint, by Surg. N. Hayward, 20th Mass.	Gangrene. Died August 19, '64; exhaustion.
54	Bingham, D., Corp'l, H, 118th Pennsylvania, age 36.	June 26, 1864.	Shot shattering right leg extensively.	June 26. 1864.	Double flap; condyles of femur sawn off and patella removed.	Gang.: hæm. Died July 25, '64; pyæmia.
55	Briggs, J., Pt., A, 26th New York.	Dec. 13, 1862.	Shot fracture of left tibia.....	Dec. 13, 1862.	Amputation at knee joint, retaining patella.	Died December 13, 1862.
56	*Brooks, E.*, Pt., K, 19th Virginia, age 26.	April 20, 1865.	Shell fracture of right leg.....	April 20, 1865.	Amputation at knee joint.....	Erys.; bed sores; large abscesses. Died May 11, '65; exhaustion.
57	Butler, G., Pt., C, 8th New Jersey, age 19.	Aug. 16, 1864.	Fracture of left leg by a fragment of shell.	Aug. 16, 1864.	Amputation at knee joint.....	Died November 22, 1864; chronic diarrhœa.
58	Campbell, B. J., Pt., H, 5th New York, age 22.	Aug. 19, 1864.	Shot wound of right leg, involving knee joint.	Aug. 20. 1864.	Flap amputation at knee joint.	Died September 19, 1864.
59	Chase, J. B., Pt., K, 24th N. York Cavalry, age 49.	June 16, 1864.	Shot fracture of left tibia and fibula.	June 16. 1864.	Amputation at knee joint.....	July 7th, lig. fem. artery. Died July 9, 1864; constitutional irritation.
60	Clark, W., Pt., A, 111th Pennsylvania.	Sept. 17. 1862.	Shot fracture of right leg.	Sept. 17. 1862.	Amputation at knee joint.....	Died October 10, 1862.
61	Cole, F., Pt., G, 61st New York.	July 3, 1863.	Shot fracture of both bones of left leg.	July 3, 1863.	Amputation at knee joint, by Surg. C. S. Wood, 66th N.Y.	Died July 9, 1863.
62	Conland, O., Pt., I, 61st N. York.	Mar. 25, 1865.	Shot wound of the left knee joint.	Mar. 25. 1865.	Amputation at knee joint, by A. Surg. C. S. Hoyt, 126th N.Y.	Died April 19, 1865.
63	Cornell, J., Pt., B, 7th West Virginia.	May 31, 1864.	Shot fracture of left knee joint.	Primary	Amputation at knee joint, by Surg. M. Rizer, 72d Penn.	Died June 3, 1864.
64	Corrigan, A. McQ., Major, 9th New York Cavalry, age 27.	May 12, 1864.	Conoidal ball fracture of upper extremity of right tibia and wound of ant. tibial artery.	May 12. 1864.	Antero-posterior flap; remov'g patella and a section of condyles of femur, by A. A. Surg. C. Rodgers and Surg. A. P. Clark, 6th N. Y. Cavalry.	May 18th, hæm., 6 oz.; popliteal artery ligated; diarrhœa. Died May 28, 1864; exhaustion.
65	*Councell, E. C.*, Col., 16th Miss., age 32.	Aug. 21, 1864.	Musket ball fracture of right leg near knee.	Aug. 21, 1864.	Antero-posterior flap, by Surg. A. A. White, 8th Maryland.	Sept. 2d, hæm., 14 oz.; Sept. 3d, lig. femoral; Sept. 10th, hæm. recurred and proved fatal.
66	Douglass, J., Serg't, G, 63d Indiana.	Nov. 24. 1864	Fracture of right leg, extending to knee j't, by a cannon ball.	Nov. 24. 1864.	Amputation at knee joint.....	Died November 25, 1864.
67	Draher, W., Pt., B, 51st Pennsylvania, age 32.	June 3, 1864.	Shot fracture of upper third of left leg. (Wound of shoulder.)	June 3. 1864.	Lateral flap amp. at knee joint, by Surg. A. F. Whelan, 1st Michigan S. S.	June 11th, hæm. Died June 24, 1864; exhaustion.
68	Fitzsimmons, J. M., Pt., E, 19th Indiana, age 22.	June 18, 1864.	Conoidal ball fracture of right leg.	June 18, 1864.	Amputation at knee joint.....	Parts gangrenous. Died August 17, 1864, of injury.
69	Gervig, H., Pt., K, 15th N. York Artillery, age 28.	Mar. 31, 1865.	Conoidal ball fracture, involving right knee joint.	Mar. 31, 1865.	Amputation at knee joint, by Surg. A. A. White, 8th Md.	Died April 7, 1865; exhaustion.

No.	Name, Military Description, and Age.	Date of Injury.	Nature of Injury.	Date of Operation.	Operation and Operator.	Result and Remarks.
70	Gooley, N., Pt., C, 73d Ohio.	May 25, 1864.	Shot wound of the knee. (Also wound of neck.)	May 25, 1864.	Amputation at knee joint, by Surg. I. N. Himes, 73d Ohio.	Died August 14, 1864.....
71	Gould, M. W., Corp'l, H, 36th Illinois, age 20.	May 14, 1864.	Conoidal ball fracture of left tibia and fibula in mid. third.	May 15, 1864.	Circular amput'n at knee joint.	Died September 19, 1864; chronic diarrhœa.
72	Grice, T., Pt., E, 38th Col'd Troops, age 22.	Sept. 29, 1864.	Conoidal ball fracture of right leg.	Sept. 29, 1864.	Amputation at knee joint.....	Died March 21, 1865.
73	Gulick, W. O., Corp'l, M, 1st Iowa Cavalry.	Aug. 27, 1863.	Shot fracture of the right leg.	Aug. 27, 1863.	Disarticulation at knee joint, by Surg. J. C. Lynch, 1st Mo. Cav.	Died September 3, 1863.
74	*Harbor, E.*, Pt., G, 21st Virginia Cavalry, age 33.	Aug. 4, 1864.	Shell fracture of right tibia and fibula, extending into knee j't.	Aug. 4, 1864.	Anterior skin flap; patella removed; condyles of femur undisturbed.	Died Aug. 20, 1864; exhaustion consequent upon excessive ichorous discharge; autopsy.
75	Hedder, W., Pt., C, 56th N. York.	June 1, 1862.	Shot fracture of leg, involving the knee joint.	June 1, 1862.	Amputation at knee joint.....	June 13th, amp. thigh, mid. third; 29th, hæm. Died July 3, 1862; exh., diar., bed sore. *Spec.* 4933.
76	Hughes, A. J., Pt., B, 14th Infantry, age 26.	May 5, 1864.	Conoidal ball wound of left knee.	May 5, 1864.	Antero-posterior flap at knee joint.	Died June 6, 1864. *Card Photo's A. M. M.*, Vol. 2, p. 45.
77	Johnson, T. R., Pt., F, 95th Ohio.	Aug. 30, 1862.	Gunshot wound.....	Aug. 31, 1862.	Amputation at left knee joint.	Died September 21, '62; tetanus.
78	Judd, W. B., Adjutant, 97th New York.	Feb. 7, 1865.	Shot fracture of knee, severe..	Feb. 7, 1865.	Amputation at knee joint.....	Died February 19, 1865.
79	Kennedy, J. A., Corp'l, H, 38th Ohio, age 24.	Sept. 1, 1864.	Conoidal ball fracture of the right tibia.	Sept. 2, 1864.	Flap amputation at knee joint.	Died December 24, 1864; chronic pneumonia.
80	Koch, J. R., Serg't, F, 69th Penn., age 22.	June 16, 1864.	Grapeshot fracture of left knee joint.	June 16, 1864.	Circular amput'n at knee joint, by Surg. G. L. Potter, 145th Pennsylvania.	July 3, 4, hæm., 15 oz.; lig. fem. artery. Died July 12, 1864; exhaustion.
81	Krowlow, H., Pt., A, 66th New York, age 18.	Mar. 31, 1865.	Shot wound of the right leg...	April 1, 1865.	Antero-posterior flaps at knee joint.	Gang.; slough.; femur protrud.; hæm.; femoral artery lig.; June 23d, recur'd; re-lig. Died June 24, 1865; exhaustion.
82	Lepper, W. F., Pt., H, 143d Pennsylvania.	May 5, 1864.	Conoidal ball fracture, involving right knee joint.	May 5, 1864.	Antero-posterior flaps at knee joint, leaving condyles and patella, probably by Surg. J. H. Brinton, U. S. V.	Died May 15, '64, hæm. (?) BRINTON (J. H.), *Am. Jour. Med. Sci.*, 1868, Vol. 55, p. 316.
83	Long, J. W., Serg't, I, 8th Kansas, age 23.	Dec. 16, 1864.	Conoidal ball fracture of right leg.	Dec. 17, 1864.	Flap, by Surg. J. R. Ludlow, U. S. V.	Dec. 18th, hæm.; lig. int. artic. art.; Dec. 25th, hæm. from ext. artic. art., 1 qt. Died Dec. 26, 1864.
84	Long, W., Pt., A, 1st Missouri Artillery, age 40.	Sept. 21, 1862.	Shot wound, involving head of right tibia and patella.	Sept. 21, 1862.	Amputation at knee joint.....	Died October 27, 1862; pyæmia. *Spec.* 467.
85	Matthews, S., Pt., A, 93d Pennsylvania, age 28.	May 15, 1864.	Shot comminuted fracture of left tibia and fibula.	May 17, 1864.	Lateral flap at knee joint.....	May 30th, hæm.; rec. June 3, 5, 8, 12; lig. pop. artery; hæm. June 16. Died June 17, '64; pyæmia.
86	McCullough, W. T., Serg't, I, 2d New York.	Aug. —, 1862.	Gunshot wound of leg	On field.	Amputation at knee joint.....	Lig. sloug.; hæm.; attempt to lig.; tetanic symp. Died Sept. 7, '62.
87	Merrill, S., Pt., I, 39th Mass., age 39.	Feb. 7, 1865.	Shot fracture of upper third of right tibia.	Feb. 7, 1865.	Flap amputation at knee joint.	Typhoid symptoms. Died March 3, 1865; pyæmia.
88	Opperman, J., Pt., E, 8th New Jersey.	May 5, 1864.	Conoidal ball fracture of left knee joint.	On field.	Amputation, by Surg. N. Hayward, 20th Mass.	Bone removed. Died May 15, 1864.
89	Parmenter, E. M., Pt., I, 15th Massachusetts.	Sept. 17, 1862.	Gunshot fracture of leg.....	On field.	Amputation at left knee joint..	Died October 13, 1862.
90	Rathburne, E., Pt., C, 36th Wisconsin, age 27.	May 31, 1864.	Conoidal ball fracture of right tibia.	May 31, 1864.	Flap, through the knee joint, by Surg. N. Hayward, 20th Massachusetts.	Sloughing. Died June 9, 1864; pyæmia; autopsy. *U. S. San. Com. Mems.*, Surg. Vol. I, p. 372.
91	*Rea, J.*, Pt., H, 24th Virginia.	May 16, 1864.	Conoid. ball fract. of patella and articular surf. of head of tibia.	May 18, 1864.	Long posterior flaps, by Surg. C. B. Gibson, C. S. A.	Bone protruded. Died July 19, 1864.
92	Ribinger, R., Pt., B, 27th Pennsylvania.	June 11, 1862.	Gunshot wound of the knee joint.	June 11, 1862.	Amputation at the knee joint..	Died June 15, 1862.
93	Roberts, E. P., Corp'l, G, 107th Illinois, age 20.	Feb. 18, 1865.	Shell shattering both bones of left leg in upper third.	Feb. 18, 1865.	Antero-posterior flap, Bauden's operation, by Surg. E. Shippen, U. S. V.	Slough.; cond. pro. Died Apr. 22, '65; pyæ. BRINTON (J. H.), *Am. Jour. Med. Sci.*, '68, Vol. 55, p. 321.
94	Russell, J., Pt., D, 27th Michigan, age 51.	July 30, 1864.	Fracture of upper third of right leg by a conoidal ball.	July 30, 1864.	Double skin flap, by Surg. A. F. Whelan, 1st Mich. S. S.	Thigh inflam.; disch. from end of stump. Died Aug. 18, '64; asthe.
95	Scott, J., Pt., F, 1st N. Y. Dragoons, age 33.	May 31, 1864.	Conoidal ball shattering bones of left leg.	June 1, 1864.	Amputation at knee joint.....	Slough. June 16, hæm.; 18th, lig. fem. art. Died June 18, '64; col.
96	Slater, P., Pt., I, 170th New York, age 45.	May 24, 1864.	Fracture of upper third of left leg by a conoidal ball.	May 26, 1864.	Amputation at left knee j't, by Surg. N. Hayward, 20th Mass.	Died June 4, 1864; effects of wounds.
97	Smith, H., Pt., I, 14th New Jersey, age 24.	June 7, 1864.	Conoidal ball wound of left leg and right thigh.	June 7, 1864.	Flap amp. at left knee j't and amp. right thigh, lower third.	Died June 17, 1864. (TABLE XXXII, No. 1745, p. 265.)
98	Stanley, W., Pt., H, 53d Pennsylvania, age 26.	Dec. 13, 1862.	Conoidal ball fracture of upper third of right leg.	Dec. 14, 1862.	Amputation at knee joint, removing the patella.	Stump swollen and bulbous, thigh honey-comb. by small abscesses; chronic diarrh. Died April 26, 1863; exhaustion. *Spec.* 1240.
99	Storey, J. M., Pt., H, 37th Wisconsin, age 30.	July 30, 1864.	Grapeshot fracture of left tibia and fibula.	July 31, 1864.	Amputation at knee j't, Butcher's operation, by Surg. A. F. Whelan, 1st Mich. S. S.	Slough. Aug. 15th, hæm.; Apr. 14, 1865, amp. thigh, mid. third. Died July 3, '65; gang. (TABLE XXXIX, No. 157, p. 316.)
100	Sutton, G. H., Pt., B, Purnell's Md. Legion, age 34.	Aug. 18, 1864.	Fract. of mid. third of left tibia and fibula by conoidal ball.	Aug. 19, 1864.	Amp. at knee joint, by Surg. A. A. White, 8th Maryland.	Died September 7, 1864; exhaustion.
101	Swan, D. K., Pt., F, 38th Ohio, age 18.	Sept. 1, 1864.	Shot fracture of the right tibia.	Sept. 1, 1864.	Antero-posterior flaps; removing condyles.	Died December 26, 1864.
102	Thompson, I. R., Pt., I, 6th Wisconsin, age 20.	May 11, 1864.	Shell comminuted fract. of left tibia and fibula near knee.	May 12, 1864.	Antero-posterior flaps, by Surg. A. J. Ward, 2d Wisconsin.	Died June 27, 1864; exhaustion.
103	Tilbury, G., Pt., E, 74th Illinois.	May 27, 1864.	Shot fracture of the right leg..	May 27, 1864.	Amp., by Surgs. W. P. Pierce, 88th Ill., and H. E. Hasse, 24th Wis.	Died June 12, 1864.
104	Turner, W. H., Serg't, 6th New York Battery, age 26.	May 6, 1864.	Cannon ball struck left leg, fracturing the tibia and the fibula.	May 6, 1864.	The patella, condyles, and synovial surfaces were not removed: and the capsules of the joint, divided at their distal extremities, were preserved, by Ass't Surg. G. M. McGill, U. S. A.	May 20th, hæm., 4 oz.; hæmorrh. recurred; flaps opened, sloughy tissue removed; end of bone necrosed. Died May 27, 1864; pyæmia.
105	Waldenburg, G., Pt., A, 46th New York, age 29.	July 30, 1864.	Conoidal ball fracture of right tibia. (Also wound of left heel.)	July 30, 1864.	Butcher's operation; long ant. flap; small portion of condyles sawn off articulating surface, by Surg. A. F. Whelan, 1st Michigan S. S.	Abscess; diarrhœa. Died Aug. 15, 1864; exhaustion.

No.	Name, Military Description, and Age.	Date of Injury.	Nature of Injury.	Date of Operation.	Operation and Operator.	Result and Remarks.
106	Westacott, R., Pt., F, 19th Massachusetts.	Dec. 13, 1862.	Shot fracture of leg	Dec. 13, 1862.	Amputation at knee joint	Died December 30, 1862.
107	*Wood, W. B.*, Serg't, I, 16th Tennessee.	Oct. 8, 1862.	Shot wound of leg	Oct. 8, 1862.	Amputation at knee joint	Died November 14, '62; typhoid fever.
108	*Baker, J. S.*, Pt., D, 25th Virginia.	May 12, 1864.	Conoidal ball fracture of patella and head of tibia.	May 13, 1864.	Large posterior flap, by Surg. C. B. Gibson, C. S. A.	May 15th, transferred to private quarters.

Intermediary Amputations at the Knee Joint.—Fifty-one intermediary operations gave a fatality of 68.0 per cent., only sixteen of the fifty determined cases having a successful issue. Three patients submitted to re-amputation in the thigh; one survived and two succumbed.

Recoveries after Intermediary Amputation at the Knee Joint.—Of the sixteen cases of this group three were Confederate and thirteen Union soldiers. The latter are all pensioners, and were living in August, 1880. In one instance primary amputation in the upper third of the leg had preceded the exarticulation at the knee, and in a second case hæmorrhage to the amount of sixteen ounces occurred from the popliteal artery seven days after the amputation. The bleeding vessel was ligated, but hæmorrhage recurring three days later, the femoral was successfully ligated:

Case 646.—Private D. Meikle, Co. B, 11th Massachusetts, aged 20 years, was wounded at Bull Run, August 30, 1862, and admitted to Fairfax Seminary Hospital nine days afterwards. Surgeon D. P. Smith, U. S. V., reported: "The case was one of gunshot wound of left knee joint, and the sequence of the injury was an amputation at the knee joint, performed by lateral flaps, on September 28th. Secondary hæmorrhage to the amount of sixteen ounces occurred on October 4th from the popliteal artery, when the stump was opened, the vessel dissected up for about two inches, and again tied. Three days afterwards hæmorrhage recurred; the stump was again reopened and the artery dissected up into Hunter's canal, where, becoming the femoral, it was then ligated. No further bleeding took place, and the patient recovered with a beautifully firm and broad stump." The patient was discharged from service December 16, 1862, and pensioned. He was paid March 4, 1880. The stump was described to be in good condition in the pensioner's application for commutation.

Case 647.—Private J. M. McGee, Co. E, 119th Pennsylvania, age 19 years, was wounded at the Wilderness, May 5, 1864. Surgeon E. B. P. Kelly, 95th Pennsylvania, recorded his admission to the field hospital of the 1st division, Sixth Corps, with "shot wound of right knee by a conical ball." Surgeon E. Bentley, U. S. V., who operated in the case, made the following report: "The patient entered Third Division Hospital, Alexandria, three weeks after receiving a wound of the right knee joint, the ball passing beneath the patella. The bones were not much fractured, but the joint was swollen and painful and the leg œdematous. Circular amputation at the knee joint, by skin flaps, was performed on June 2d, sulphuric ether being employed as the anæsthetic. At the time of the operation the patient had become very weak, his pulse quick and feeble, and he perspired considerably, had cough and spat up blood. He reacted very well. Tonics, stimulants, and nourishing diet were given, and simple dressings used. The wound healed up kindly, and the patient's general condition became much improved." The patient was subsequently treated at various hospitals, and finally, after being provided with an artificial leg, he was discharged September 9, 1865, and pensioned. Examining Surgeon E. A. Smith, of Philadelphia, certified to "amputation at the knee joint, with preservation of the patella." The pensioner was paid March 4, 1880. In his application for commutation he represented the stump of the amputated limb as being in a "sound" condition.

Case 648.—Private W. H. Thomas, Co. A, 17th Infantry, aged 19 years, was wounded at Bull Run, August 29, 1862, receiving a shot fracture of the upper third of the right leg. Assistant Surgeon B. Howard, U. S. A., reported that he amputated the leg on the field, on September 1st, at the knee joint, including the removal of the patella in the operation, which was performed by the double flap method. Several days after the date of the injury the wounded man was removed to Washington and admitted to Ascension Hospital, whence Surgeon J. C. Dorr, U. S. V., described his case as follows: "After his admission, the sutures were found upon examination to have given away and the flaps were gaping. The patient had been much exhausted by long marching prior to the battle, and it was feared that he would not survive the effects of the operation. Stimulants, beef tea, and quinine were freely given, and finally, after repeated relapses, he has now (December 3d) nearly recovered, the stump being covered with fine granulations, and his strength having recuperated to its normal standard." The patient subsequently passed through Carver and St. Elizabeth Hospitals, and on June 16, 1863, he was discharged, having been previously furnished with an artificial leg. He afterwards entered the Veteran Reserve Corps, and was ultimately discharged from service April 5, 1864, and pensioned. He was paid March 4, 1880. In his application for commutation he reported the stump as being in a good condition.

Fatal Cases of Intermediary Amputation at the Knee Joint.—The thirty-four operations were performed on three Confederate and thirty-one Union soldiers. Primary excision of three inches of the fibula, and primary amputation of the leg at the upper third, had

preceded the exarticulation at the knee in one instance each. Death was ascribed to pyæmia in eleven, to hæmorrhage in two, to gangrene in six, and to exhaustion in eight instances. Autopsies were recorded in four cases, and of nine cases specimens are preserved in the Army Medical Museum.

CASE 649.—Private M. B. Aseltyne, Co. F, 10th Vermont, aged 22 years, was wounded in the left foot, at Mine Run, November 27, 1863, and entered the Third Division Hospital, Alexandria, one week afterwards. Acting Assistant Surgeon A. P. Crafts reported: "A conical ball entered the anterior surface of the foot, fractured the cuneiform bones, and was extracted through the orifice of entrance, on the field. At the time of the patient's admission there was much tumefaction and inflammation of the foot and leg, which at first seemed to yield to treatment. But, on December 10th, evidences of gangrene began to show themselves, and four days afterwards the leg was amputated at the knee joint by Surgeon E. Bentley, U. S. V. The operation was performed by the circular method, and by retaining the patella after disarticulating the joint. Chloroform constituted the anæsthetic. Simple dressings were used to the stump, and tonics and stimulants, including iron and quinine, and acetate of ammonia were given in the treatment. On December 20th, there were symptoms of pyæmia. The patient's countenance became sallow and anxious, a severe chill occurred, and hiccough set in, followed by loss of appetite and by profuse sweating. Death supervened on December 27, 1863. At the *post-mortem* examination the liver, kidneys, spleen, and intestines were found healthy, the lungs much discolored, and some effusion in the cavity of the chest. There was also great hypertrophy of the heart and some effusion within the pericardium." A section of the stump, made by Surgeon J. H. Brinton, U. S. V., showed the femur to be healthy, although denuded of periosteum for six inches above the joint. The synovial membrane on the crucial ligament was congested, and the cartilage of the femur was thinned and softened, the whole color being changed and absorption commencing. The ligature of the popliteal artery had partially sloughed, and the base of the long internal clot had come down and projected through the opening made by sloughing in the walls of the vessel. The artery, showing its condition as described, was contributed to the Museum by the operator. A wet preparation of it constitutes specimen 1989 of the Surgical Section, and a chromo-lithographic representation is shown on PLATE XXII, opposite page 736 of the *Second Surgical Volume*.

CASE 650.—Corporal A. A. Lepper, Co. L, 8th Iowa Cavalry, aged 27 years, was wounded in the left leg, at the battle of Cassville, May 20, 1864. He was admitted to hospital at Chattanooga on the following day, and ten days afterwards he was transferred to hospital No. 8, Nashville, whence Acting Assistant Surgeon R. T. Higgins made the following report: "The injury consisted of a compound fracture of the tibia at the upper third. The day after admission the leg was placed in a box splint and kept there until, finding that the limb could not be saved, amputation or excision was determined upon; the foot having become considerably swollen and slightly œdematous, and the wound discharging ichorous pus. On June 8th and 10th, the patient also had severe chills, each attack lasting from twenty minutes to half an hour; pulse feeble and frequent; appetite wanting. Upon a thorough examination of the parts, amputation was decided to be the more advisable operation, and was performed at the knee joint, on June 13th, by Surgeon R. R. Taylor, U. S. V., in charge of the hospital. Rectangular flaps were made, with circular section of muscles, and the condyles of the femur were taken off in the operation, chloroform being employed as the anæsthetic. Two ounces of whiskey and forty drops of laudanum were administered at once after the operation, and mustard plasters were applied to the ankle and wrists. The patient reacted slowly. Milk punch and beef tea were given alternately every twenty minutes in half-ounce doses. On the following day he was troubled with colliquative diarrhœa and involuntary discharges and began to sink rapidly. There was also another chill, but not so severe as the previous ones, and on the second day the upper flap was found to be sloughing, dark in color, and gangrenous. Stimulants and nourishments were continued freely. Death occurred on June 16, 1864. At the *post-mortem* examination the lungs were found to be engorged and slightly hepatized and the intestinal canal slightly inflamed, the other organs being normal. The clot found in the femoral vein was slightly adherent and the internal coat of the vein very much inflamed. The cause of death was thought to be pyæmia." The upper half of the tibia of the amputated leg, a large fragment of it being partly necrosed and remaining in position, was contributed to the Museum by Assistant Surgeon C. C. Byrne, U. S. A., and is specimen numbered 3758 of the Surgical Section.

TABLE LVI.

Summary of Fifty-one Cases of Intermediary Amputations at the Knee Joint for Shot Fractures.

[Recoveries, 1—16; Deaths, 17—50; Unknown result, 51.]

NO.	NAME, MILITARY DESCRIPTION, AND AGE.	DATE OF INJURY.	NATURE OF INJURY.	DATE OF OPERATION.	OPERATION AND OPERATOR.	RESULT AND REMARKS.
1	*Butler, T. J.*, Lieut., A, 38th Virginia, age 28.	July 3, 1863.	Fracture of upper third of left leg by conoidal ball.	July 19, 1863.	Amputation at knee joint, by A. A. Surg. L. Fisher.	To prison April 23, 1864; afterwards exchanged.
2	Clark, O. H., Serg't, H, 1st Mass. Cav., age 30.	Nov. 27, 1863.	Pistol ball wound of left knee joint.	Dec. 2, 1863.	Flap amputation at the knee joint.	Discharged Oct. 4, 1864. Stump tender.
3	Desmond, H., Pt., I, 28th Mass., age 29.	Dec. 13, 1862.	Fracture of head of right tibia and patella; conoidal ball.	Dec. 21, 1862.	Amputation at the knee joint.	Secondary amp. lower third of thigh. Disch'd Dec. 22, 1863. (TABLE XL, No. 25, p. 320.)
4	*Frame, J. M. F.*, Pt., B, 4th Virginia, age 33.	Sept. 19, 1864.	Fracture and extensive comminution of right tibia 3 ins. below knee joint.	Sept. 22, 1864.	Circular amputation, patella retained, by Assistant Surg. G. M. Burdette, P. A. C. S.	Stump sloughed; typhoid fever. Released June 28, 1865.
5	Hawley, L. M., Serg't, I, 71st New York, age 21.	July 2, 1863.	Shot fracture of both bones of left leg in lower third.	July 5, 1863.	Flap amputation, by Surg. F. Prentice, 73d New York.	Sept. 24th, entirely healed. Discharged April 19, 1865.
6	*Lassiter, V. M.*, Pt., F, 32d Texas, age 17.	May 20, 1864.	Conoidal ball fracture of both bones of right leg in middle third.	June 5, 1864.	Amputation through condyles, removing patella; long ant. short post. flaps.	Post. flap slough.; June 10, hæm.; stump cicat'd; recovery. *C. S. Med. and Surg. Jour.*, Vol. 2, p. 28.

No.	Name, Military Description, and Age.	Date of Injury.	Nature of Injury.	Date of Operation.	Operation and Operator.	Result and Remarks.
7	McCaigue, S. B., Corp'l, H. 183d Penn., age 21.	May 12, 1864.	Shell fracture of bones of left leg; primary amputation upper third; sloughing.	May 27, 1864.	Amputation, by Ass't Surg. A. Delaney, U. S. V.	Mustered out July 13, 1865. He has caries of right tibia. Stump tender.
8	McGee, J., Pt., E, 119th Pennsylvania, age 19.	May 5, 1864.	Conoid. ball passed ben'th patel. r't knee, bones not much fract.	June 2, 1864.	Circular skin flaps, by Surg. E. Bentley, U. S. V.	Discharged September 9, 1865.
9	Meikle, D., Pt., B, 11th Massachusetts, age 20.	Aug. 30, 1862.	Shot wound of left knee joint.	Sept. 28, 1862.	Lateral flaps, by Surg. D. P. Smith, U. S. V.	Oct. 4, hæm.; lig. of popliteal; 7th, hæm.; lig. fem. Dis. Dec. 16, '62.
10	Nolan, P., Pt., G, 13th Mass., age 21.	Aug. 29, 1862.	Musket ball fracture of right tibia and fibula.	Sept. 3, 1862.	Markoe's operation; patella retained; condyles sawn off, by Surg. E. Donnelly, 2d Pa. R.	Patella raised 4 inches. Disch'd August 29, 1863.
11	Palmer, E., Pt., 6th Maine Battery, age 19.	Aug. 9, 1862.	Shell fracture of right tarsus, metatarsus, and tibia.	Aug. 14, 1862.	Anterior operation; articular surfaces of condyles sawn off, leaving patella, by Surg. E. Bentley, U. S. V.	Discharged Oct. 23, 1862. *Spec.* 53. Brinton (J. H.). *Am. Jour. Med. Sci.*, 1868, Vol. 55, p. 322.
12	Pittman, W., Pt., G, 148th Penn., age 23.	May 9, 1864.	Shell, carrying away external of malleolus of right ankle.	May 16, 1864.	Poste. museular flap, by Surg. E. Bentley, U. S. V.	Disch'd June 22, '65. 1870, stump sound.
13	Shambaugh, C., Corp'l, B, 11th Penn. Res., age 24.	Aug. 29, 1862.	Musket ball fracture of both bones of left leg in upper third.	Sept. 4, 1862.	Single upper flap, patella not removed, by Ass't Surg. B. Howard, U. S. A.	Stump healed; patella movable 4 ins. up the limb. Discharged May 22, 1863.
14	Sheppard, P., Pt., C, 34th New York, age 25.	May 31, 1862.	Shot fracture of right leg	June 5, 1862.	Circular amputation at knee joint.	Discharged April 2, 1863. Cannot wear artificial limb.
15	Thomas, W. H., Pt., A, 17th Infantry, age 19.	Aug. 29, 1862.	Conoidal ball fracture of right tibia and fibula 3 ins. below joint.	Sept. 1, 1862.	Double flap 2½ ins. long, rem'g patella and art. surfaces, by A. Surg. B. Howard, U. S. A.	Sutures gave way; flaps gaped. Disch'd April 5, 1864. Stump good, 1870.
16	Wright, O., Pt., B, 12th Penn. Res., age 20.	Dec. 11, 1862.	Musket ball wound of right leg, involving knee joint.	Dec. 14, 1862.	Flap amputation, by a Confederate surgeon.	Discharged January 19, 1863.
17	Aseltyne, M. B., Pt., F, 10th Vermont, age 24.	Nov. 27, 1863.	Conoidal ball fracture of cuneiform bones left foot; inflammation of foot and leg.	Dec. 14, 1863.	Circular amp., leaving patella, by Surg. E. Bentley, U. S. V.	Died Dec. 27, 1863; pyæmia. Autopsy. *Spec.* 1989.
18	Bailey, W. H., Pt., A, 2d New York Cav., age 23.	June 9, 1863.	Shot fracture of right leg.....	June 18, 1863.	Amputation at the knee joint.	Sloughing; hæmorrhage, 20 oz. Died June 29, 1863.
19	Blancheau, P., Pt., I, 28th Massachusetts, age 22.	June 4, 1864.	Fracture of exter. condyle and slight fract. of inter. condyle of right femur.	June 8, 1864.	Skin flap, 1 inch of condyle, including fract. portion, rem'd, by A. Surg. S. B. Ward, U. S. V.	June 12th, gang.; 14th. hæm. Died June 16th, '64; gangrene and hæmorrhage. *Spec.* 2656.
20	Britton, M., Corp'l, F, 7th Penn. Res., age 21.	Dec. 13, 1862.	Musket ball fracture of cuboid and astragalus of right foot.	Dec. 26, 1862.	Circular, by Surg. E. Bentley, U. S. V.	Jan. 7, '63, hæm.; lig. fem.; gang. Died Jan. 12, 1863. *Spec.* 4541.
21	Carroll, F., Pt., K, 45th Pennsylvania, age 23.	June 3, 1864.	Shot injury of right fibula; primary excision.	June 18, 1864.	Ant.-post. flap, rem'g patella, by Surg. R. B. Bontecou, U. S. V.	Hæm. from ant. tibial art. Died June 22, 1864: exhaustion.
22	Danzenbaker, L. H., Pt., D, 10th New Jersey, age 21.	June 2, 1864.	Grapeshot struck inner condyle of femur; joint opened.	June 7, 1864.	Circular amp., skin flaps, by Surg. E. Bentley, U. S. V.	Died June 12, 1864: gangrene.
23	Eno, C., Pt., B, 91st Ohio, age 23.	July 20, 1864.	Musket ball fract. right tibia; leg swollen and ecchymosed.	July 31, 1864.	Antero-posterior flap, by Surg. J. B. Lewis, U. S. V.	Diarrhœa. Died August 9, 1864.
24	Farley, A., Pt., I, 83d New York, age 31.	May 9, 1864.	Shot fract. inter. malleolus of r't ankle j't; tissues œdematous, pus extend. nearly to knee j't.	May 15, 1864.	Circular by skin flaps, by Surg. E. Bentley, U. S. V.	Died June 1, '64; pyæmia. *Spec.* 2655.
25	Fuller, C. E., Pt., D, 36th Wisconsin, age 25.	June 3, 1864.	Conoidal ball fract. of os-calcis; left foot and leg in very bad condition.	June 9, 1864.	Skin flap, ½ inch of condyle removed, by Ass't Surg. S. B. Ward, U. S. V.	Gangrene. Died June 13, 1864; pyæmia. *Spec.* 2660. (Amputation was a last resort.)
26	Glazier, J. M., Pt., H, 55th New York, age 27.	May 31, 1862.	Wounds through both ankles; comminution left; fract. right; swollen and sloughing.	June 4, 1862.	Antero-post. flap at left knee joint, by Surg. R. B. Bontecou, U. S. V.	Died June 10, 1862; pyæmia.
27	Headley, S. G., Pt., F, 12th New Jersey, age 34.	May 10, 1864.	Conoidal ball commin. fract. of up. third of right tib. and fib.; j't swollen and erysipelatous.	May 18, 1864.	Flap amputation, by A. A. Surg. W. H. Ensign.	Tendency to slough. Died May 30, 1864.
28	*Hennessy, D.*, Pt., I, 8th Alabama.	May 5, 1862.	Shot fract. up. third left tibia; knee joint opened by fissures.	May 17, 1862.	Amputation at knee joint, by A. Surg. J. S. Billings, U. S. A.	Died August 27, 1862. *Spec.* 929.
29	*Hicks, W.*, Serg't, B, 14th Tennessee, age 28.	July 1, 1863.	Left tibia seriously injured and partly fractured; sloughing; hæm. from post. tibial artery.	July 25, 1863.	Long ant. flap, leaving patella and condyles, by A. A. Surg. J. A. Draper.	Slough. Died Aug. 10, '63; exh. *Spec.* 2051. Brinton (J. H.). *Am. Jour. Med. Sci.*, 1868, Vol. 55, p. 324.
30	Hoscid, A., Pt., I, 4th Maryland, age 27.	May 7, 1864.	Conoidal ball fract. of malleolus and astragalus; left foot and ankle much swollen.	May 15, 1864.	Ant. post. flap, retaining patella and condyles, by Ass't Surg. H. Allen, U. S. A.	Slough. Died May 28, '64; gang.; absorption. *Am. Jour. Med. Sci.*, 1865, XLIX, p. 33.
31	*Jewell, W.*, Pt., D, 59th Georgia.	May 10, 1864.	Conoidal ball fracture of metatarsal bones.	May 22, 1864.	Long post. flap, by Surg. C. B. Gibson, C. S. A.	May 24th, delirium. Died May 29, 1864.
32	Lepper, A. A., Corp'l, L, 8th Iowa Cavalry, age 27.	May 20, 1864.	Comminuted fract. up. third of left tibia by con. ball; foot swollen and œdematous.	June 13, 1864.	Rectangular flaps; circ. sect. muscles; condyles sawn off, by Surg. R. R. Taylor, U. S. V.	Slough.; gang.; colliquative diar. Died June 16, 1864; pyæmia. *Spec.* 3758.
33	McConnell, D. W., Pt., H, 46th Ohio.	April 6, 1862.	Shot fracture of the leg	April 10, 1862.	Amputation, by Ass't Surg. W. D. Turner, 1st Illinois Light Artillery.	Slough.; intermed. amp. thigh. Died April 25, 1862. (Table XXXVI, No. 481, p. 300.)
34	McFarland, A., Pt., I, 150th Penn., age 23.	May 10, 1864.	Ball lodging in articulation beside right external malleolus; tissues œdematous.	May 27, 1864.	Anterior oval skin flap, by Surg. E. Bentley, U. S. V.	May 29th, gang., which caused death June 7, 1864.
35	McKenna, J., Pt., D, 39th New Jersey, age 29.	April 2, 1865.	Conoidal ball wound of left ankle; infiltration of pus in tissues of leg.	April 24, 1865.	Circular amputation at knee joint, by Surg. E. Bentley, U. S. V.	Died May 2, 1865; exhaustion.
36	Mansfield, M., Corp'l, F, 2d Connecticut H'vy Artillery, age 21.	May 31, 1864.	Shot fracture of right tibia, extending into knee joint.	June 4, 1864.	Post. flap; ant. incision from condyle over mid. of patella, and condyles sawn off, by A. A. Surg. J. F. Thompson.	Died June 16, 1864; pyæmia.
37	Marys, D., Pt., C, 90th Pennsylvania.	May 5, 1864.	Shot wound of right leg; parts gangrenous.	May 10, 1864.	Amputation at knee joint, by Surg. J. Ebersole, 19th Ind.	Popliteal sloughed; hæm., 50 oz. May 20th, amp. thigh. Died May 20, '64. *Spec.* 2340. (Table XXXVI, No. 475, p. 300.)
38	Mearns, J., Pt., D, 154th N. York, age 22.	May 4, 1863.	Shot wound of leg.....	May 14, 1863.	Amputation at the knee joint.	Died June 7, 1863; hæmorrhage and anæmia.
39	Murray, J., Pt., B, 51st N. York.	May 6, 1864.	Shot wound of right ankle....	May 18, 1864.	Amputation at the knee joint.	Died May 20, 1864.
40	Ostre, P., Pt., H, 72d New York, age 21.	May 10, 1864.	Conoidal ball fracture of tibia, ankle joint opened; leg swollen to knee.	May 21, 1864.	Long anterior, short post. flap, leaving patella, by Ass't Surg. G. A. Mursick, U. S. V.	Died June 1, '64; pyæmia. *U. S. San. Com. Mems.*, Surg. Vol. 1, p. 522.
41	Parks, L. C., Pt., E, 11th Vermont, age 28.	June 1, 1864.	Ball lodged in condyle of left femur, splitting it into knee joint.	June 7, 1864.	Ant. skin and post. muse. flaps; ½ inch of condyles of femur removed, by Surg. E. Bentley, U. S. V.	June 10th, gangrene. Died June 17, 1864; prostration.

No.	Name, Military Description, and Age.	Date of Injury.	Nature of Injury.	Date of Operation.	Operation and Operator.	Result and Remarks.
42	Rhinehart, C., Pt., K, 74th Pennsylvania, age 21.	Aug. 27, 1862.	Shot wound of leg; primary amputation up. third; sloughing.	Sept. 21, 1862.	Circular amputation at knee joint, by Surg. E. Bentley, U. S. V.	Died September 23, 1862; gangrene.
43	Sandford, W. W., Pt., F, 103d Pennsylvania, age 21.	Dec. 18, 1862.	Ball passed between bones of right leg 3 ins. below knee joint; tibia indented; pus in synovial cavity.	Jan. 10, 1863.	Antero-posterior flaps; condyles were sawn off and patella removed, by Surg. E. P. Moroney 2d Maryland.	Jan. 11th. chill and dyspnœa. Died Jan. 12, 1863; pyæmia.
44	Schreiber, A., Pt., A, 50th Pennsylvania, age 17.	May 10, 1864.	Wound of both legs; fracture of right tibia; round ball; 19th. hæm.; lig. post. tib. art.	May 19, 1864.	Antero-posterior flap, remov'g patella, by Surg. R. B. Bontecou, U. S. V.	June 1st, pyæmic symp. Died June 9, 1864; pyæmia.
45	Sheldon, C. S., Serg't, G, 12th New Hampshire, age 21.	June 3, 1864.	Grapeshot fract. left ext. malleolus, communicating with ankle joint; gangrenous.	June 22, 1864.	Anterior post. flap, by Surg. R. B. Bontecou, U. S. V.	Progress unfavorable. Died June 27, 1864; exhaustion.
46	Sweeney, J., Pt., H, 9th Maine.	July 18, 1863.	Right leg shattered by a grapeshot.	July 27, 1863.	Posterior flap amputation at the knee joint.	Died July 28, 1863.
47	Unknown, age about 35.....	———	Shot fracture of head of tibia, extending into knee joint.	Some days after injury.	Disarticulation at knee joint, leaving patella; sawing off tips of condyles, by Ass't Surg. C. C. Lee. U. S. A.	Died about three days after operation; exhaus.: pyæmic symp. BRINTON (J. H.). *Am. Jour. Med. Sci.*, 1868, Vol. 55, p. 324.
48	Veazie, C. H., Pt., C, 1st Mass. Cavalry, age 21.	Nov. 27, 1863.	Fract. and extensive comminution of r't tibia and fibula near ankle j't; much ecchymosed.	Dec. 6, 1863.	Antero-posterior flap through knee joint, by Surg. E. Bentley, U. S. V.	Dec. 10th, gangrene. Died Dec. 21, 1863; pyæmia; autopsy.
49	Velsor, A., Pt., D, 127th N. York, age 36.	Nov. 30, 1864.	Ball thro. head of tibia, fract. tibia and fibula; knee joint involved.	Dec. 9, 1864.	Antero-posterior skin flaps, by Ass't Surgeon C. F. Reber, U. S. V.	Died Dec. 22, 1864; pyæmia.
50	Wilhelm, J., Pt., A, 37th Ohio.	May 17, 1862.	Musket ball fracturing both bones of left leg in middle; sloughing.	May 31, 1864.	Amputation at the knee joint, by Surg. J. F. Gabriel, 11th Ohio.	Diffused abscess extending to hip. Died June 14, 1862.
51	*Chandler, A. J.*, Lieut., G, 40th Georgia, age 25.	May 26, 1864.	Fracture of right tibia, middle third; conoidal ball; large ulcer in leg.	June 21, 1864.	Amputation at knee joint thro' condyles, leaving patella.	June 30, '64, sloughing of stump. *C. S. Med. and Surg. Jour.*, Vol. 2, p. 33.

Secondary Amputations at the Knee Joint.—The secondary exarticulations at the knee joint numbered twenty-six; twelve were successful and fourteen were fatal, a mortality of 53.8 per cent. In four cases excision in bones of the leg, in four amputation of the leg, and in one amputation of a toe, had preceded the amputation at the knee.

Successful Cases of Secondary Amputation at the Knee Joint.—The patients were ten Union and two Confederate soldiers. Two of the ten Union soldiers have since died; the remaining eight were pensioners in 1880. In the following instance primary amputation in the middle third of the leg had been performed for shot fracture of the ankle joint. Sloughing and ulceration followed, and the limb was exarticulated at the knee fourteen months after the ablation of the leg:

Case 651.—Private W. Neveling, Co. N, 71st Pennsylvania, aged 26 years, was wounded at White Oak Swamp, June 30, 1682, and was admitted to Broad and Cherry Streets Hospital, Philadelphia, one month afterwards. Surgeon J. Neill, U. S. V., reported: "The injury was produced by a minié ball, which entered the outer side of the right ankle joint and passed directly through, severely comminuting the bones. Amputation of the leg at the middle third was performed the same day on the field, the operation being performed by the double flap method. The wounded man was taken prisoner and remained on the field for ten days, when he was sent to Richmond. After being paroled he was brought to this hospital, entering on July 30th, at which time the flaps had sloughed and both bones were protruding from the stump. There was also profuse discharge of unhealthy pus, and the patient's health was very much broken down. Stimulating poultices were applied, and the patient was ordered extra diet, with tonics, milk punch, and beef tea. Under the treatment adopted new tissue developed in the stump and the patient improved; but his recovery was necessarily slow. On November 13th, a piece of necrosed bone, four inches in length, was removed from the fibula, and three days later a large piece was removed from the tibia. After this the stump improved rapidly and the patient's general condition continued very good until March 15, 1863, when he injured the stump by a fall. Immediately after, sloughing recommenced, which was not checked until a month had elapsed and produced a condition of the parts from which recovery was slow. Under the application of fermenting poultices, with solution of chloride of zinc and sulphate of copper used alternately, the ulcer slowly diminished. On June 22d, when the patient was transferred to Satterlee Hospital, the lower end of the stump appeared to be made up of a carneo-osseous matter, on the extremity of which there remained an ulcer about two inches in diameter." Acting Assistant Surgeon T. G. Morton reported the subsequent progress of the case at Satterlee Hospital as follows: "At the time of admission the stump was still unhealed, and from the end of the bone a bulky exostosis sprang out as large as an orange. The tissue over this growth was constantly ulcerating and painful, and the disease continued to involve the tibia further up, reaching as high as the ligamentous patella. On August 27th, I proposed amputation at the knee joint for the reason that less shock follows that operation and a better stump is obtained, with more power, from non-division of the muscles of the thigh and non-interference with the medullary canal, lessening the danger of pyæmia. I made a long anterior and short posterior flap, leaving the patella in.

Fig. 251.—Hyperostosis of bones of right leg, after amputation. *Spec.* 2778.

No necrosis followed the operation, and the patient recovered with a most useful and firm stump." The patient was discharged from service March 3, 1864, and pensioned. He was paid December 4, 1879. The specimen, numbered 2778 of the Surgical Section, is represented in the annexed cut (FIG. 251), and forwarded to the Museum by the operator, shows an extraordiuary osseous formation at the divided extremities of the tibia and fibula, due to an exaggeration of the natural process by which the extremities of the bones are rounded off, and presents the histological characters of ordinary callus. The sequestrum, removed from the fibula prior to the second amputation, was also contributed by Surgeon Neill, and a cast of the stump of the disarticulated knee was furnished by Surgeon I. I. Hayes, U. S. V. The former is numbered specimen 668, and the latter 2458 of the Surgical Section.[1]

CASE 652.—Corporal E. C. Wright, Co. H, 21st New Jersey, aged 19 years, was wounded at Fredericksburg, May 3, 1863, by a solid shot, which carried off his right foot. Amputation of the leg by posterior flap, at the junction of the middle and lower third, was performed on the field by Surgeon D. McNeill, 21st New Jersey, and several days afterwards the patient was sent to Washington, where he entered Judiciary Square Hospital. He was discharged from service June 13, 1863, and pensioned. Subsequently the stump became diseased, inducing the pensioner, in January following, to seek relief by treatment at St. Luke's Hospital, New York City. The tibia became necrosed and cloaca formed, leading to sinuses in the substance of the bone, so that an injection would find its way through the canals. On June 23, 1864, amputation through the knee joint by antero-posterior flaps was performed by Dr. Gurdon Buck, the cartilages and patella being allowed to remain. Sulphuric ether was used as the anæsthetic. At the time of the operation the patient was in feeble condition, owing not only to the amount of pus discharged from the stump, but also to the presence of an abscess in the region of the liver, which had formed some months after the first amputation. This abscess discharged itself by a track passing between the ribs over the right lobe of the liver. There had been no admixture of bile, however, in the discharge, nor did jaundice exist at any time. A succession of abscesses formed during the healing of the stump. The first appeared at the upper boundary of the synovial sac and was freely laid open by Dr. Buck. Six days after the operation a tendency to slough appeared, and permanganate of potash was applied to the affected parts. Dr. Buck's method of extension by weight and pulley, with bands of adhesive plaster, was also used to prevent the retraction of the edges of the flaps and maintain them in apposition. This afforded great relief to the patient, steadying the limb and taking all the strain off the flaps. On September 1, 1864, the patient was discharged from hospital, the stump being solid and well rounded. The abscess in the side had ceased to discharge. In the following month the pensioner was fitted with an artificial leg by Dr. E. D. Hudson, of New York City. Pension Examining Surgeons who have inspected the stump have described it as a "very good" one, and the pensioner has reported its condition as "sound and healthy." He was paid March 4, 1880.

CASE 653.—Private H. A. Steward, Co. B, 8th Pennsylvania Reserves, aged 23 years, received a fracture of the right leg by a fragment of a shell, at Gaines's Mill, June 27, 1862. He was conveyed to Washington, where he remained under treatment at the Cliffburn Hospital until November 20, 1862, when he was discharged and pensioned, Surgeon H. Bryant, U. S. V., certifying to "exsection of a large portion of the tibia in consequence of the wound." Examiner George McCook, of Pittsburg, December 17, 1863, testified to the injury, and that "exfoliation is going on in a slight degree. He can walk inconveniently," etc. The pensioner subsequently entered the Good Samaritan Hospital, Cincinnati, where the injured limb was amputated on April 1, 1867, by Dr. Thomas H. Kearney, who certified as follows: "I amputated the leg through the knee joint, the section of the bone being performed through the condyles of the femur. The amputation was rendered necessary in consequence of inflammation of the tibia, leading to abscesses and general infiltration of the tissues. Removal of the condyles was necessitated in consequence of the want of sufficient healthy integument to cover them. The wound he had received involving the tibia, doubtless left it impaired in vitality and prone to attacks of inflammation, such as rendered its removal ultimately necessary." The Quincy Examining Board, in 1872, reported that "the flaps have sloughed from gangrene, leaving the bone only covered with tender cicatricial tissue, which often gives away and becomes an open ulcer," etc. The pensioner was paid March 4, 1880.

Fatal Cases of Secondary Amputation at the Knee Joint.—Fourteen operations were performed, three on Confederate and eleven on Union soldiers. The fatal results were attributed to pyæmia in three, to erysipelas in one, to exhaustion in eight instances:

CASE 654.—Private P. Fallon, Co. D, 11th Infantry, aged 20 years, was wounded in the left leg, at Gaines's Mill. June 27, 1862. He was captured by the enemy and remained a prisoner for one month, when he was exchanged and conveyed by the Hospital Steamer Daniel Webster to Philadelphia. Acting Assistant Surgeon R. R. Thomas recorded the following description of the case: "The patient entered the Episcopal Church Hospital July 30th, there being an irregular cavity in the front of his injured leg, running into the tibia but not reaching the fibula. He had been wounded by a bullet, which entered about nine inches above the inter-malleolar space, and was extracted, in part, two days after his admission. The opening in the leg was about one and a half inches square and about one inch deep, its sides being formed by necrosed bone and injured flesh. Pieces of bone had been taken out on previous days, and the patient was doing well. On August 6th, Acting Assistant Surgeon R. S. Kenderdine amputated the leg at the knee joint. On August 22d, secondary hæmorrhage occurred from ulceration and resulted in considerable loss of blood, the patient being found quite blanched. A tourniquet was then applied and the instruments were gotten ready to tie the bleeding vessel; on loosening the tourniquet, however, the bleeding was found to be arrested and no ligation necessary. The patient died October 6, 1862, worn out by puriform discharges and of pyæmia. The end of the stump was in pretty good condition, but large abscesses had formed in the thigh, and his back was covered with bed sores." The upper half of the amputated tibia, with the integument over the wound of entrance, enlarged by sloughing, attached, was contributed to the Museum by the operator (*Cat. Surg. Sect.*, 1866, p. 396, *Spec.* 500). The specimen shows an oblique fracture of the bone, with comminution, and a portion of the bullet remaining in the medullary canal. The cavity in the shaft is also exhibited, and the posterior surface of the shaft is covered with a moderate layer of new osseous tissue.

[1] A brief abstract of this case was published by Dr. JOHN H. BRINTON, *On Amputation at the Knee Joint and at the Knee*, in *Am. Jour. Med. Sci.*, 1868, Vol. LV, p. 319.

TABLE LVII.

Summary of Twenty-six Cases of Secondary Amputation at the Knee Joint for Shot Fracture.

[Recoveries, 1—12; Deaths, 13—26.]

No.	NAME, MILITARY DESCRIPTION, AND AGE.	DATE OF INJURY.	NATURE OF INJURY.	DATE OF OPERATION.	OPERATION AND OPERATOR.	RESULT AND REMARKS.
1	*Brady, J. W.*, Pt., E, 6th Louisiana.	Aug. 29, 1862.	Shot wound of the leg	Nov. 20, 1863.	Amp. at left knee j't, by Surg. J. C. Nott, C. S. A.	Recovery.
2	Bronchard, A., Pt., A, 5th New Hampshire, age 31.	April 7, 1865.	Fract. meta. bones of left foot; conoidal ball; April 17, exc. meta's; May 15, amp. leg. Disch'd Aug. 12, 1865.	Feb. 18, 1866.	Amputation at knee joint, in New York City Hospital.	Amputation of thigh near middle; recovery; 1870, stump healthy. (TABLE XXXIX, No. 11, p. 313.)
3	Frost, N. G., Pt., G, 32d Maine, age 34.	July 30, 1864.	Shot fract. left leg; prim. amp. at mid. third. Disch'd Feb. 8, 1865.	May 29, 1865.	Amp. knee joint, patella retained, by Dr. J. Lord, Norway, Maine.	April, 1866, leg in bad condition; 1870, stump tender and irregular.
4	Marsein, J., Pt., A, 115th New York, age 28.	Feb. 20, 1864.	Musk't ball lodged in r't patella; remo'd on 21st. Disch'd May 24,'65; anchy. knee j'nt. May, 1866, leg atrophied: condy. of femur eroded.	May 28, 1866.	Antero-posterior flap; 1 inch of extremity of condyles of femur sawn off; patella retained, by Dr. E. Mason, New York City.	Hæmorrhage; ice; flap healed almost by first intention; left hospital cured, July 28,'66. BRINTON (J. H.). *Am. Jour. Med. Sci.*, 1868, Vol. 55, p. 321.
5	Neveling, W., Pt., N, 71st Pennsylvania, age 26.	June 30, 1862.	Con. ball shattering bones of right ankle. Prim. amp. mid. third; sloughing. Nov. 13, sequestra removed.	Aug 27, 1863.	Long ant. and short post. flap, retaining patella and condyles of femur, by A. A. Surg. T. G. Morton.	Disch'd March 3, '64. *Specs.* 668, 2458, 2778. BRINTON (J. H.), *loc. cit.*, p. 319.
6	Pattee, J. H., Pt., D, 26th Ohio, age 23.	Sept. 19, 1863.	Shot fract. mid. third of left. tib. Sept. 21, exc. 2 ins.; bone exf.; separation of bone 2 ins.	Jan. 24, 1864.	Circular amputation, by Surg. J. Y. Finley, 2d Kentucky Cavalry.	Disch'd July 14, 1864; stump sound, 1870.
7	Perigo, H. C., Pt., B, 12th New York, age 30.	June 27, 1862.	Round ball fract. of mid. third right tibia; nec.; large seq. firmly set.	Mar. 14, 1863.	Long anterior flap, leaving condyles and patella, by A. A. Surg. J. A. Draper.	Recovery rapid; discharged Nov. 14, 1863. *Spec.* 2065. BRINTON (J. H.), *loc. cit.*, p. 323.
8	Reeder, J. H., Pt., E, 1st Colored Troops, age 22.	Aug. 12, 1864.	Fract. upper third of left tibia; conoidal ball; necrosis.	Mar. 19, 1865.	Double flap, by A. A. Surg. O. Shittler.	Discharged Nov. 8, 1865. Died August 5, 1870.
9	Steward, H. A., Pt., B, 8th Pennsylvania, age 23.	June 27, 1862.	Fract. right tibia; shell; excis. tibia. Discharged Nov. 20, 1862; exfoliation; general infiltration of tissues.	April 1, 1867.	Amputation; removal of condyles necessitated by want of healthy integument, by Dr. T. H. Kearney, Cincinnati.	Gangrene; sloughing of flaps; 1872, tender covering of stump often gives way and becomes an open ulcer.
10	*Walk, W.*, Pt., D, 52d North Carolina, age 22.	July 3, 1863.	Con. ball fract. left tib. and metatarsal; tissues slough. nearly two-thirds circumference of leg.	Aug. 4, 1863.	Flap amputation, leaving patella and condyles, by A. A. Surg. J. A. Draper.	Exchanged March 17, '64. *Spec.* 2061. BRINTON (J. H.), *loc. cit.*, p. 324.
11	Walter, G., Pt., H, 98th Pennsylvania, age 37.	July 2, 1863.	Shell fract. of mid. third of left leg; gangrene; tibia much diseased.	Nov. 8, 1863.	Ant. post. flap, retaining patella and condyles of femur, by A. A. Surg. M. S. Perry.	Disch'd Aug. 2, 1865. *Spec.* 2791. Died Dec. 5, 1873. BRINTON (J. H.), *loc. cit.*, p. 319.
12	Wright, E. C., Corp'l, H, 21st New Jersey, age 19.	May 3, 1863.	Solid shot taking off right foot; amp. juncture of low. thirds; necrosis of tibia. Discharged June 13, 1863.	June 23, 1864.	Ant. post. flap, cartilages and patella allowed to remain, by Dr. Gurdon Buck, New York City.	Succession of abscesses. Buck's method of extension to prevent retraction of flaps. Recovered Sept. 1, 1864.
13	*Adams, D. F.*, Pt., A, 55th North Carolina.	July 1, 1863.	Shot fract. junc. low. thirds left tibia (also fract. orbital arch and flesh wounds right leg); necrosed tibia.	Aug. 29, 1863.	Flap amputation left knee joint, leaving patella, by A. A. Surg. C. G. M. Griffith.	Ascites; general anasarca. Died Sept. 20, 1863. *Spec.* 2049.
14	Billington, H., Pt., I, 115th New York, age 45.	Aug. 16, 1864.	Conoidal ball inj'y of left tibia; gangrene; tibia necrosed.	Sept. 26, 1864.	Antero-posterior flap, by Ass't Surg. C. Wagner, U. S. A.	Died September 28, 1864; exhaustion.
15	Fallon, P., Pt., D, 11th Infantry, age 20.	June 27, 1862.	Shot lodged in left leg. Aug. 1, ball ext.; cavity in front of leg excavated into tibia 1 inch square and deep.	Aug. 6, 1862.	Amputation at the knee joint, by A. A. Surg. R. S. Kenderdine.	Aug. 22d, hæm. from ulceration; large abscess in thigh; bed sores. Died Oct. 6, 1862; exhaus. and pyæmia. *Spec.* 500.
16	*Forbes, W. A.*, Pt., A, 55th North Carolina, age 24.	July 1, 1863.	Con. ball fract. lower third left tibia; caries and nec.; slough.; bone exposed one fourth its length.	Aug. 6, 1863.	Flap amputation, leaving patella, by Ass't Surg. B. Stone, U. S. V.	Died August 11, 1863; exhaustion. *Spec.* 2058.
17	Foster, W., Pt., A, 22d Ind., age 22.	Aug. 7, 1864.	Shot fract., fourth toe, left foot; con. ball; amp. toe; gang.; dis. of tibia; caries.	Nov. 24, 1864.	Circular amputation, by Ass't Surg. R. McGowan, U. S. V.	Died November 27, 1864.
18	Garrity, M., Pt., I, 9th Mass., age 25.	May 5, 1864.	Right tibia extensively comminuted near crest; con. ball lodged; suppurat'n from knee to ankle.	June 10, 1864.	Ant. skin and post. muscular flaps; condyles of femur removed, by Ass't Surg. S. B. Ward, U. S. V.	Never rallied thoroughly; wound did well, nearly uniting. Died June 17, '64; prostration. *Spec.* 2551.
19	Grainger, S. M., Pt., A, 38th Indiana, age 23.	Dec. 30, 1862.	Shot fracture of left tibia and fibula. Jan. 14, 1863, excision fractured portions. Feb. 20, gangrene.	Mar. 15, 1863.	Malgaigne's oval flap amputation at the knee joint.	April 1, 1863, hæm. from branch of popliteal; sloughing. Died April 23, 1863; pyæmia.
20	Kane, W. H., Serg't, I, 115th New York, age 23.	Aug. 16, 1864.	Con. ball injury of left tibia; gangrene; tibia exposed five inches.	Sept. 17, 1864.	Antero-posterior flap, by Ass't Surg. C. Wagner, U. S. A.	Sept. 25th, hæm., 15 oz.; lig. fem. Died Sept. 26, 1864; exhaustion and hæmorrhage.
21	Peddie, J., Pt., B, 139th N. York, age 24.	June 3, 1864.	Shell fracture lower third left tibia; gangrenous.	Aug. 1, 1864.	Antero-posterior flap, by Surg. R. B. Bontecou, U. S. V.	Died August 18, 1864; exhaustion. *Spec.* 3065.
22	Sager, S., Pt., K, 5th Vermont, age 18.	June 29, 1862.	Fracture middle third of left tibia and fibula by a round ball.	Oct. 6, 1862.	Antero-posterior integument'ry flap; patella and condyles were left.	Died Oct. 9, 1862; pyæmia. *Spec.* 270. BRINTON (J. H.), *loc. cit.*, p. 323.
23	Sharp, T., Corp'l, I, 38th Illinois, age 30.	Feb. 6, 1864.	Conoid. ball fract. of right tibia; injury of artery. Feb. 7, exc. tibia; slough.; bones carious; tibia separated 3 inches.	April 5, 1864.	Circular amp. at knee joint, by Surg. I. Moses, U. S. V.	Gangrene. Died June 23, 1864; erysipelas.
24	Skilton, G. T., Pt., I, 36th Wisconsin, age 31.	June 3, 1864.	Conoidal ball fract. of low. third right tibia and fibula; gang.; sloughing of post. tibial art.; August 4, hæmorrhage.	Aug. 8, 1864.	Antero-posterior flap, by Surg. R. B. Bontecou, U. S. V.	Aug. 10th, gangrene: condyles of femur protr.; hæm. Aug. 30th, amp of thigh. Died Sept. 19, 1864. (TABLE XXXIX, No. 156, p. 316.)
25	Toppings, E., Corp'l, D, 147th New York, age 29.	June 18, 1864.	Conoidal ball fract. of mid. third of right tibia; necrosis.	Oct. 10, 1864.	Posterior flap, removing patella, by A. A. Surg. H. Boardman.	October 20th, partial union. Died May 11, 1865; variola.
26	*Waddell, W. E.*, Pt., H, 1st Virginia, age 33.	July 3, 1863.	Conoidal ball fracture of external malleolus of right tibia, opening ankle joint; slough'g.	Aug. 8, 1863.	Flap, leaving patella, by A. A. Surg. C. G. M. Griffith.	Died August 12, 1863; exhaustion. *Spec.* 2064.

Amputations at the Knee Joint of Uncertain Date.—The date of the exarticulation at the knee was not reported in four cases. Two of the patients were Confederate and two Union soldiers. Of the latter one died, the other is a pensioner. The meagre details are recorded in the following summary:

TABLE LVIII.

Summary of Four Cases of Amputation at the Knee Joint of Uncertain Date.

[Recoveries, 1—3; Death, 4.]

No.	NAME, MILITARY DESCRIPTION, AND AGE.	DATE OF INJURY.	NATURE OF INJURY.	DATE OF OPERATION.	OPERATION AND OPERATOR.	RESULT AND REMARKS.
1	*Faubion, H.*, Pt., K, 9th Texas.	Before June 19, 1863.	Gunshot wound; fract. of knee joint.	———	Amputation at the left knee joint.	Transferred August 19, 1863.
2	Keefe, P., Seaman, U. S. Brig Perry, age 24.	April 28, 1863.	Shot wound of left ankle.....	———	Amputation at the knee joint..	Discharged November 12, 1864; pensioned.
3	*Moore, J. R.*, Lieut., K, 33d North Carolina.	Before Aug. 26, 1864.	Shot fracture of left leg.....	———	Amputation at the knee joint..	Transferred September 30, 1864.
4	Call, G., Pt., H, 18th Ohio.	Dec. 31, 1862.	Shot wound of leg	———	Amputation at the knee joint..	Died January 16, 1863.

Adding to the one hundred and eighty-nine cases of amputations at the knee joint performed for shot fracture during the American civil war, six cases of exarticulation for shot flesh wounds, cited in TABLE VII, on p. 56, one hundred and twenty-eight cases collected in *Note* 1, on p. 397, and four operations performed by medical officers of the United States Army[1] since 1871, not heretofore published, we have in the annals of surgery a total

[1] The exarticulations at the knee joint performed in the United States Army since the date of the publication of *Circular* 3, 1 *Report of Surgical Cases Treated in the Army of the United States from* 1865 *to* 1871, Washington, War Department, S. G. O., 1871, are: 1. Private G. Grove, Co. F, 2d Infantry, aged 34 years, while firing a small swivel gun near Mount Vernon Barracks, Alabama, July 5, 1875, was wounded by the bursting of the piece, a fragment of which, weighing six and a half pounds, passed through his left leg, carrying away a portion of both bones to within a short distance of the knee joint, destroying the main arteries and lacerating the soft parts. The fracture extended into the articulation. The man had been drinking excessively, and the injury occurring some distance from the post, considerable hæmorrhage took place before assistance could be procured and a tourniquet applied. While being conveyed to hospital he fainted several times and had involuntary evacuations of fæces and urine. No reaction taking place and the venous hæmorrhage being uncontrollable, the patient was with difficulty etherized, and disarticulation was rapidly performed by Assistant Surgeon J. K. Corson, U. S. A. The operation was performed without removing the patella, the condyles of the femur being sawn through, and a long anterior and short posterior flap being made. There was scarcely any arterial hæmorrhage, and only two vessels besides the popliteal were ligated. Reaction was slow, and irritability of the stomach great on account of the large amount of liquor imbibed. The wound was closed with silk sutures; adhesive strips and water dressings and carbolic acid solution were applied. The case progressed favorably and the stump had almost closed, the man being able to sit up, when, on July 27th, erysipelas ensued with symptoms of an alarming nature. Sloughing of the flaps followed, and an abscess formed on the outer side of the thigh. Under the local application of hot fomentations and the internal administration of tincture of chloride of iron the inflammation subsided. About one month afterwards the stump had almost entirely healed, having the appearance of being a good one as regards bearing pressure. On December 6, 1875, the patient being entirely cured, he was discharged from service and sent to the Soldiers' Home. The bones of the amputated leg and the removed ends of the condyles of the femur, together with the fragment of the gun which inflicted the injury, were contributed to the Museum by the operator, and constitute specimen 6581 of the Surgical Section.—2. Sergeant H. F. Gude, Co. G, 12th Infantry, was wounded in the battle at the Modoc Caves, Lava Beds, California, April 15, 1873, by a conical bullet, which caused a compound comminuted fracture of the right tibia at the upper third and wounded the posterior tibial artery. Both ends of the vessel were ligated and temporary splints were applied on the field. The wounded man was conveyed to hospital at Peninsula Tula Lake, California, where Smith's anterior splints were employed. The leg was swollen, and mortification had appeared about the wound on April 19th, when amputation at the knee joint was performed by Assistant Surgeon H. McElderry, U. S. A., the patella being dissected out and the articulating surface of the femur removed. The patient suffered high surgical fever and constitutional excitement. During the period of suppuration the flaps retracted and the suture was torn out. The treatment consisted of antiseptic applications, tonics, and stimulants. In October following the stump had healed, and on January 7, 1874, the patient was transferred to his command.—3. Private F. Heber, Co. M, 1st Cavalry, aged 32 years, was wounded in the right arm and right leg during the fight at Clearwater River, I. T., July 11, 1877. He arrived at the field hospital at Grangeville three days after the injury, and six days later he reached the post hospital at Fort Lapwai. During the night previous to his arrival at the latter place a profuse hæmorrhage, probably from the anterior tibial artery, occurred, which was quickly arrested by compression of the femoral artery by Surgeon G. M. Sternberg, U. S. A., who, as soon as candle lights could be procured and a tourniquet applied, placed the man under the influence of ether and enlarged the wound in the upper part of the calf of the leg for the purpose of securing the bleeding vessel. It was then discovered that the head of the tibia was badly shattered by the ball, which entered two inches below the knee joint, perforating the bone and comminuting it to a considerable extent posteriorly; and amputation through the knee joint was at once decided upon as preferable to ligation of the femoral with a certainty almost that amputation would have to be performed subsequently. The operation was performed by Surgeon Sternberg, with the assistance of the Hospital Steward only, the patient being feverish from his wound, which had been painful, and fatigued from his transportation in a farm wagon. The stump was dressed with carbolic acid mixture. A large portion of the wound healed promptly, but some sloughing occurred near the centre of the extremity of the stump. On August 7th, when the patient was transferred to Fort Vancouver, only a space the size of a half-dollar piece remained to be filled by granulations. On March 13, 1878, the patient was discharged from service entirely cured.—4. Beatrice Hanciva, a woman twenty-two years of age and in the third month of pregnancy, was accidentally shot, at or near Fort Clark, Texas, November 28, 1871. A full charge of buckshot, discharged at a distance of a few feet, passed through her right leg at the junction of the middle and upper third, shattering the bones and extensively destroying the soft parts. Acting Assistant Surgeon A. L. Buffington failed to obtain the consent of the patient and her relatives to an amputation until December 2d, when, in consultation with Assistant Surgeon J. H. Patzki, U. S. A., amputation through the knee joint was decided upon. The amputation was performed with long anterior and short posterior flaps, retaining the patella

of three hundred and twenty-seven amputations at the knee joint for shot injury, with one hundred recoveries, two hundred and twenty-four deaths, and three undetermined results, giving a mortality rate of 69.1 per cent.

CONCLUDING OBSERVATIONS ON SHOT INJURIES OF THE KNEE JOINT.—With a very few exceptions,[1] writers on military surgery prior to the American civil war[2] agreed that shot wounds of the knee joint with fracture of the articulating surfaces of the bones required immediate amputation, and the correctness of this rule seems to have been generally accepted by the medical officers serving in the Union and Confederate armies. Surgeon T. H. Squire, 89th New York Volunteers, in his note-book of surgical cases at the Big Spring Hospital, near Sharpsburg, Maryland, on October 16, 1862, writes: "Every knee joint fractured by a ball should be amputated, and the quicker the better." Surgeon David Judkins, U. S. V., at the West End Military General Hospital, Cincinnati, in September, 1862, reports: "I have had three cases here of shot wounds in the knee joint, admitted, one in twelve, another in fifteen, and a third in seventeen days after the reception of the injury, in all of which the hope of successful issue in the removal of the leg by amputation had passed away. They all died. The operation should have been performed on the field." Surgeon H. S. Hewit, U. S. V., in charge of the Frederick Hospital, Maryland, January, 1863, argues: "The absolute law of strictly primary amputations in perforations of the knee joint has been distinctly asserted. In compound frac-

but dividing the rectus tendon and extirpating the lower bursa. The condyles were not removed, and only four ligatures were required. The wound was closed by stitches and adhesive straps. The stump was dressed with carbolated ointment, and when suppuration had commenced it was syringed twice a day with solution of permanganate of potash. The popliteal ligature came away on the twelfth day. The patient (who remained ignorant of the loss of the limb) continued to do well, the wound healing kindly, until December 20th, when rigors were soon followed by marked symptoms of pyæmia, which terminated her life on December 29th. She aborted a few days before death.

[1] JOBERT DE LAMBALLE, who, according to PAUL (*Die Conservative Chirurgie der Glieder oder Darstellung der Mittel and Methoden, welche zur Vermeidung, respective Beschränkung, der Amputation und Knochen-Resectionen sich darbieten*, Breslau, 1859, p. 192), was the only advocate of conservative measures in shot fractures of the knee joint, contended (*Des plaies d'armes à feu. Communications* par MM. les Docteurs BAUDENS, *etc.*, Paris, 1849, p. 166): "Les plaies pénétrantes de l'articulation du genou, regardées principalement comme nécessitant l'amputation, ont été traitées par la position horizontale et par une médication antiphlogistique très énergique et les cataplasmes froids Ce traitement a été également employé, soit que les os fussent intéressés, ou que la membrane synoviale ait été seule ouverte. Trois malades ont guéri sur six, et on sait que JOHN BELL avait défié qu'on lui montrât une guérison sur mille." But nearly fifty years before JOBERT, JEAN MÉHÉE (*Traité des plaies d'armes à feu*, Paris, An. VIII, p. 172) had urged conservation in such cases: "Une balle peut causer un grand délabrement dans ces articulations, briser les os, déchirer les tendons, les ligamens, les capsules; accidens tous fort graves, mais qui n'indiquent point l'amputation. Une balle, quelque violente contusion qu'elle cause, ne sauroit détruire les ressources des parties qu'elle frappe, et la contusion qu'elle peut causer ne s'étendant que dans son trajet et dans les parties qu'elle divise, ne présente qu'une indication principale, celle des incisions. Lorsque ces incisions sont bien dirigées, et que l'escarre est divisée, tous les accidens que pourroit entraîner l'espèce de contusion que la balle a faite, cessent, et l'amputation ne sauroit être indiquée."

[2] WISEMAN (R.) (*Severall Chirurgicall Treatises*, London, 1676, p. 430) cites a case of shot fracture of the knee joint: "Death followed, as commonly it doth in all such Wounds of the great joints. Therefore at sea, while they are warm with heat of Fight, we dismember them." DESPORT (*Traité des Plaies d'Armes à feu*, Paris, 1749, p. 225): "Si toute l'extrêmité inférieure du fémur est fracassée et toute la partie supérieure du tibia, et plus encore si ces deux os sont fracassés à la fois, il est absolument indispensable de couper la cuisse." SCHMUCKER (J. L.) (*Vermischte Chirurgische Schriften*, Berlin und Stettin, 1785, B. I, pp. 37, 38) declares that when the bones of the knee joint are comminuted, its ligaments are torn, or when the popliteal artery is shot through, amputation must be performed at once: "The sooner the operation is done the better will be the result." THOMSON (JOHN) (*Report of Observations made in the British Hospitals in Belgium after the Battle of Waterloo*, Edinburgh, 1816, p. 243): "Immediate amputation has generally been acknowledged to be particularly necessary in wounds in which bullets have passed through the knee joints and have fractured the articulating surfaces of the bones. Almost every case of this kind which we saw in Belgium seemed to afford a proof of the propriety of this rule in military surgery." HENNEN (JOHN) (*Observations on some important points in the practice of Military Surgery*, Edinburgh, 1818, p. 159): "In my own practice, I have met with only two cases where the limb was saved after a serious injury of the knee joint, and in one of them only was the perfect use of it restored." GUTHRIE (G. J.) (*Treatise on Gunshot Wounds*, London, 1827, p. 379): "Wounds of the knee joint, with fracture of the great bones composing it, from musket balls, require amputation . . from an extensive practice in wounds of the knee joint, with fracture of the articulating surface of the femur or tibia, I have no hesitation in declaring amputation to be imperiously demanded, and that it ought to be performed with the least possible delay consistent with propriety; and on no account should the surgeon wait to give the wound a trial; for I most solemnly protest, I do not remember a case recover in which I knew the articulating end of the femur or tibia to be fractured by a ball that passed through the joint, although I have tried great numbers, even to the last battle of Toulouse." In 1855, in his *Commentaries on the Surgery of the War in Portugal, Spain, France, etc.*, London, 6th ed., 1855, p. 82, the same author remarks: "Wounds of the knee joint from musket balls, with fracture of the bones composing it, require immediate amputation, for although a limb may be sometimes saved, it cannot be called a recovery, or a successful result, where the limb is useless." ESMARCH (F.) (*Ueber Resectionen nach Schusswunden*, Kiel, 1851, p. 129): "All shot wounds of the knee joint in which the epiphysis of the femur or tibia has been injured demand immediate amputation of the thigh; this is a deplorable sentence, already given by the best authorities, and which our experience has fully confirmed." MACLEOD (G. H. B.) (*Notes on the Surgery of the War in the Crimea*, London, 1858, p. 310) remarks: "The knee when penetrated by gunshot, presents an injury of the gravest description. Taking much interest in cases of this description, I visited every one I could hear of in camp, and can aver that I have never met with one instance of recovery in which the joint was distinctly opened, and the bones forming it much injured by a ball, unless the limb was removed." LOHMEYER (C. F.) (*Die Schusswunden und ihre Behandlung*, Göttingen, 1859, p. 202): "But when the capsule is opened and the condyles of the femur or tibia are injured, the prospect for the preservation of the limb, and, should the latter be attempted, for the preservation of life, is very poor. Therefore amputation of the thigh is always indicated in such wounds, and is to be performed as early as possible."

tures of the thigh the fatal result is usually the indirect, in gunshot wounds of the knee the direct, result of the accident. Much greater latitude both as respects operation and the period of operation in the former than in the latter class of cases, for obvious reasons, must be allowed. The shock of a wound of the knee joint when recognized by the system is profoundly constitutional and speedily fatal, in obedience to an obscurely understood physiological law. When the joint has been pierced and rent in the wedge-like manner described, molecular death commences. The system does not immediately recognize the fact, and this explains the delay of shock and the delusive appearance which these cases present. At a varying period of from three to ten or twelve days, according to constitutional and local circumstances and the rapidity of interstitial degeneration, postponed shock occurs, commencing with undefined but threatening expressions of uneasiness, and attaining its full development in surgical rigor and fatally declining reaction in typhoid surgical fever, with pyæmia, traumatic pneumonia, purulent cachexia, or uræmia, as the case may be, and all equally indicating hopeless injury overwhelming vital force." Surgeon A. B. Crosby,[1] U. S. V., advised amputation in shot fractures of the articulating surfaces of the knee joint, and added: "Slight injuries of this joint, it is true, may recover under favorable circumstances, although injuries seemingly insignificant often prove fatal." Surgeon J. T. Woods, 99th Ohio Volunteers, gave it as his experience[2] that "if bony structure is involved, fracture and comminution produced, the only warrantable procedure is amputation, the attempt to save the limb no less than a wanton robbing of the unfortunate sufferer of the only chance for life, by operative procedure." Based upon his experience as medical inspector during the War, Professor F. H. Hamilton declared, immediately after its close, that the surgeon should not attempt to save the limb[3] "when the fracture implicates the knee joint, or even when it is near the knee joint, experience having shown that amputations near the knee joint give a better percentage of recoveries than any other thigh amputations, while, on the other hand, attempts to save the limb in these cases give a worse percentage of success than in any other fractures of the thigh." Equally emphatic are the opinions of the surgeons of the Confederate army. Dr. Hunter McGuire[4] says: "As Medical Director of a large army, and one more actively engaged, probably, than any similar force in the late Confederacy, I saw a larger number of these cases of wounds of the knees involving the extremity of the bones, but not one which recovered without amputation. Whenever the surgeon persisted in his effort to save the limb, the patient died." Confederate Surgeon J. W. Thompson,[5] of Kentucky, maintained: "Gunshot wounds of the knee joint have claimed much attention during the past half century in both military and civil practice. I feel confident that the surgical experience in our late war in reference to this class of wounds is largely in favor of primary amputation," and Confederate Surgeon T. G. Richardson[6] declared that during his whole experience in the army he did not witness "a single recovery without amputation from unmistakable gunshot wound of the knee joint, with injury, however slight, to the femur or tibia." The attempts at conservation after shot fractures of the knee joint were therefore fewer than those after shot fractures of the

femur. We have seen on page 175, *ante*, that of six thousand five hundred and seventy-six shot fractures of the shaft of the femur, three thousand four hundred and sixty-seven, or over one-half, were throughout treated without operative interference; but in only eight hundred and sixty-eight, or about one-fourth of the three thousand three hundred and fifty-five reported cases of shot fractures of the articular extremities of the bones of the knee joint, conservation of the limb was attempted, and this preference for amputation in shot fractures of the knee joint was, in many instances, not so much due to the teachings of the masters of surgery of the first half of the present century as to the sad experience gained from the attempted practice of conservative measures which a number of the American surgeons were desirous to give a fair trial. Surgeon J. Moore, U. S. A., Medical Director of the Department of Tennessee, after the battle of Chattanooga, in November, 1863, declared that: "The attempts at conservative surgery in wounds of the knee joint were not encouraging. Of sixteen cases reported as occurring in the 2d, 3d, and 4th divisions, seven underwent primary amputation and seven were treated without amputation. On the twenty-fifth day one case not amputated had died and only two reported favorable for recovery." Surgeon M. G. Sherman, in charge of the 2d division, Twenty-first Corps, in a letter to Medical Director A. J. Phelps, reports cases of shot wounds of the knee joint observed by him, and remarks: "Believing the surgeon who saves a limb is more justly entitled to credit than he who operates scientifically, I was inclined to be conservative in my practice and treatment of those who came under my care, and operated only when it was fully apparent the patient could not be saved without an operation, and was compelled, as a result, to perform more secondary operations than I otherwise should have been." Surgeon I. Moses, U. S. V., believing that in cases of shot wounds of the knee "the patients had not so much died from the injury itself as from timid surgery," the surgeon failing to freely lay open the joint, determined to save the limb in a number of cases under his charge at the hospital at Chattanooga, in the summer of 1863; but the ultimate results were very discouraging,[1] and Surgeon Moses had to admit[2] that he had "lost confidence in the possibility of saving gunshot wounds of the knee joint, involving fractures of the con-

[1] Dr. I. MOSES (*Surgical Notes of Cases of Gunshot Injuries occurring during the advance of the Army of the Cumberland, in the summer of* 1863, in *Am. Jour. Med. Science*, April, 1864, Vol. XLVII, pp. 339 *et seq.*): "Ten cases of wounds of the knee joint were admitted." "Of these," Dr. MOSES reports "three died without operation; one died after amputation; one died of secondary hæmorrhage from a branch of the popliteal artery; three were nearly recovered when I left the post, September 15 [1863], and two remained with fair chances of ultimate recovery. Thus we have one-half the cases, which will, in all probability, be saved with useful limbs and various amounts of motion in the joints." Surgeon MOSES admits that "these cases were treated under the most favorable circumstances; the physical condition of the men was most excellent, and soon after the reception of the injury they were taken to well-appointed hospitals, surrounded with comfort and with every luxury of diet at command, and skilful surgical attendance." But let us examine the five cases of alleged recovery after shot fractures of the knee joint, cited by Dr. MOSES, and see how his expectations were realized: Private A. Loutenschlager (MOSES, *loc. cit.*, CASE V, p. 341), Co. A, 77th Pennsylvania, admitted to general field hospital at Murfreesboro', June 27, 1863, who, it was thought on September 15, 1863, would "recover with an anchylosed joint," died on September 26, 1863, in consequence of active inflammation and burrowing of pus in the joint and up the thigh. Captain *Pettigrew*, 20th Tennessee (MOSES, *loc. cit.*, CASE III, p. 340), admitted to general field hospital at Murfreesboro', June 27, 1863, and declared "beyond all danger" on September 16th, submitted to secondary amputation in the lower third of the thigh on January 4, 1864, and died on January 7, 1864. (See TABLE XL, No. 178, p. 322, *ante*.) In the case of Adjutant *Y*—— [*J. R. Youre*], Caswell's Georgia Sharpshooters (MOSES, *loc. cit.*, CASE II, p. 340), admitted to hospital No. 1, Murfreesboro', June 26, 1863, no information later than July 27, 1863, can be obtained, when the prisoner was sent to Nashville with wound healed and partial anchylosis of joint. Sergeant Haynie (MOSES, *loc. cit.*, CASE I, p. 340), 10th Ohio Cavalry, wounded at Hoover's Gap, June 24, 1863 [not June 6, 1863, as stated by Dr. MOSES], and admitted to hospital at Murfreesboro', June 27th, recovered, was promoted to 1st Lieutenant and mustered out with his regiment July 24, 1865. This case is reported on the Murfreesboro' hospital register as "a fracture of the patella, carrying away the upper half of it and opening the knee joint." Haynie is not a pensioner. Private Edward Phipps, Co. F, 6th Indiana (MOSES, *loc. cit.*, p. 341, CASE IV), also wounded at Hoover's Gap, Tennessee, June 24, 1863, and admitted to hospital at Murfreesboro', June 27th; recovered, and was discharged September 20, 1864, with almost complete anchylosis. He is a pensioner, and Pension Examiner G. W. MEARS reported, on September 24, 1864: "Ball entered inside right knee, and ranging outward and downward, escaped about two inches lower down, upon outside, passing into joint on inside and through upper part of head of tibia on outside; . . leg weak, and a partial anchylosis exists with slight angle at the knee." In September, 1877, the Dayton Board of Examiners stated: "There is a creaking in the joint on motion being made, and partial anchylosis; leg is weak, and he carries a cane constantly." Granting that in the two cases cited last the articular extremities of the femur or tibia were implicated, which is by no means certain, we find that of the 8 cases treated conservatively, possibly 3, or, considering the case of *Youre* as undetermined, only 2 recovered, a mortality rate of, respectively, 62.5 or 71.4 per cent. As the cases cited by Surgeon MOSES have been made a basis for the advocacy of conservative measures in shot fractures of the knee joint by DEININGER (C.) (*Ueber die conservative Behandlung der Schusswunden des Kniegelenkes*, München, 1867, p. 28) and by other European surgeons, it has been deemed best to refer to the cases here somewhat in detail.

[2] MOSES (I.), *Surgical Notes of Cases of Gunshot Injuries occurring near Chattanooga in the Battles of September, October, and November*, 1863, in *American Journal Medical Science*, October, 1864, Vol. XLVIII, p. 363.

dyles of the femur or head of the tibia, under the usual circumstances of bustle and confusion of the field, and repeated removals of wounded in ambulances to the rear."

When it is considered that of three thousand three hundred and fifty-five shot injuries of the knee joint with lesion of the articulating surfaces of the bones, grouped in TABLE LII, on page 367, only eight hundred and sixty-eight, with three hundred and thirty-eight recoveries, were conservatively treated, and that in these eight hundred and sixty-eight cases are included one hundred and seventeen, with eighty-four recoveries, in which the synovial cavity was not primarily opened and only the patella fractured; furthermore, that with the exception of a few instances, in which amputation was refused or in which the cases came to the notice of the surgeons at a period when the proper time for amputation had passed, the cases reserved for conservative treatment were those deemed to have the best chances of a favorable result, the percentage of mortality (60.6 per cent.) must be regarded as very large, and the question naturally arises whether fewer attempts at conservation would not have saved more lives. It has already been pointed out on page 332 that the mortality of the two thousand three hundred and ninety-nine amputations of the thigh after shot fracture of the knee joint was only 51.1 per cent. Of these two thousand three hundred and ninety-nine amputations in the thigh for shot wounds of the knee joint, one thousand five hundred and twenty-five, with six hundred and sixty-nine deaths, were primary operations, giving a mortality of 43.8 per cent., while eight hundred and thirty-nine, with five hundred and thirty-two deaths, or 63.4 per cent. fatality, were intermediary or secondary operations, performed, generally as a last resort, when it became evident that a continuance of the conservative treatment would inevitably lead to a fatal issue. Thus it will be seen that the mortality after shot fractures of the bones of the knee joint treated conservatively, even under the most favorable circumstances, exceeded the mortality after primary amputation in the thigh by 16.8 per cent.

Shot fractures of the knee joint by small projectiles, in their early stages, are among the most deceptive of serious injuries. Surgeon H. S. Hewit, U. S. V., observed, in a report from Frederick Hospital, in January, 1863: "The conical wedge-like missile, propelled by an irresistible force and revolving with the rapidity of a steam augur, pierces, bores, and comminutes without occasioning great displacement. The bones are broken into a great number of minute fragments which are still held together by their capsular and ligamentous investments. The destruction is as great *ab interno*, as it would be *ab externo* by crushing between a railroad carriage wheel and the iron rail." Deluded by the seeming insignificancy of the external injury, the patient not rarely refuses to submit to amputation until the moment of hopeful operation has passed. Several cases of recovery after severe comminuted fractures of the bones of the knee joint are, it is true, recorded in the annals of surgical literature. Such examples have been cited among the cases of shot injuries adduced in *Note* 3, on page 368, and similar instances will be found among the cases collected in the appended table (TABLE LIX, page 417), in which it has been attempted to give a numerical summary of the cases of this nature recorded by writers on surgery; but these fortunate results only seem to indicate, as Professor von Langenbeck[1] remarks: "that if amputation is refused, the surgeon must never despair of saving life."

It has been shown on page 28 that of three hundred and fifty-one cases of shot wounds of the knee joint with either primary or secondary involvement of the joint capsule, but without lesion of the bony structure, ninety-eight, or 27.9 per cent., proved fatal. The

[1] LANGENBECK (B. v.), *Ueber die Schussfracturen der Gelenke und ihre Behandlung*, Berlin, 1868, p. 28.

attempt to save the limb should always be made in injuries of this nature, and amputation has not been advocated by military surgeons, although Schwartz[1] remarks that: "According to our experience we cannot find fault with the surgeon who, in a case of clearly defined extensive wound of the joint capsule, prefers immediate operation to generally useless attempts at conservation with subsequent secondary amputation." Stromeyer, Langenbeck, Legouest,[2] and others believe simple wounds of the joint capsule, without lesion of the bony structure, to be very rare; but the records of the American civil war, of the Franco-Prussian War of 1870–71, and of the Russo-Turkish War of 1877 (TABLE LIX, page 417), furnish examples of such injuries, and the experiments of Woods,[3] Simon,[4] and

[1] SCHWARTZ (HARALD), *Beiträge zur Lehre von den Schusswunden*, Schleswig, 1854, p. 173.

[2] STROMEYER (L.) (*Erfahrungen über Schusswunden im Jahre* 1866, Hannover, 1867, p. 57): "I will not deny that there are cases in which an opening in the knee joint made by a bullet will heal, but they must be very rare. I have not and do not expect to see one, because a ball which opens the joint must, as a rule, interest one of the articulating ends." LANGENBECK (B. V.) (*Ueber die Schussfracturen der Gelenke und ihre Behandlung*, Berlin, 1868, p. 38): "That the knee joint can be shot through from before backwards without lesion of bone I cannot think possible. There will always be more or less deep grooving of the condyles, and I have been able to feel the grooving in two cases of recovery." LEGOUEST (L.) (*Traité de Chirurgie d'Armée*, Paris, 1872, p. 444): "On voit cependant quelquefois des balles atteindre et même traverser de part en part de grandes articulations sans toucher les os. Nous avons traité, pendant la campagne d'Orient (1855), un militaire qui eut manifestement l'articulation du genou ouverte par une balle: le projectile passa immédiatement au-dessus de la rotule entre le tendon de cet os et les condyles du fémur sans fracturer ni les uns ni les autres et sans même déterminer d'accidents sérieux; mais ce sont là de rares exceptions."

[3] WOODS (J. T.) (*Gunshot Knee Joint Injuries*, in *Ohio Med. and Surg. Jour.*, 1864, Vol. XVI, p. 295): "The joint is only traversed by the ball, no fracture being inflicted, or at most simply a grooving or abrasion of the articular cartilages occurring. This idea seemed to find confirmation in the fact that in these cases the ball uniformly passed antero-posteriorly, or laterally in certain directions at the level of the joint, thus affording the first qualification of this occurrence. Passing antero-posteriorly the nearly level articular surface of the tibia, the large size of the inter-condyloid notch would, especially if the knee were partially bent, render the passing of a ball, without violently impinging on bony structure, quite easy of occurrence; and similar considerations of anatomy and varied position seemed to afford a similar explanation to the harmlessness of the balls—cases where their course was laterally through the anterior third of the joint. These theoretic views it was found quite easy to demonstrate upon the dead subjects: making a slit in the ligamentum patellæ below the patella itself, passing in a narrow bladed knife to clear away the soft parts, and slightly flexing the leg upon the thigh, I was enabled to introduce through the joint into the popliteal space a round piece of wood one-third greater in diameter than a minié ball, and by flexing the leg to a right angle with the thigh, the space between the bones of the joint on the anterior aspect was found to be quite sufficient for the passage of a minié ball laterally, and through the tense skin the opening would be so small that when the leg was straightened it would appear to have entered immediately below the inner condyle."

[4] SIMON (*Kriegschirurgische Mittheilungen. Zur Prognose und Behandlung der Schusswunden des Kriegelenkes*, in *Deutsche Klinik*, 1871, B. XXIII, p. 258 *et seq.*) tried to "determine these questions by experimental means, and obtained surprisingly clear results. I had three round iron rods made provided with very sharp points; one of the rods had the thickness of a Chassepot missile, the other that of the Prussian *Langblei*, and the third a yet greater thickness; and with these I attempted to penetrate the knee joints of dead bodies in various directions. With the limb extended it was impossible to push any one of the rods through, bone being struck everywhere. But on very little flexion, with the knee bent at 170°, the joint became so far opened that one could put the thinner rod through the intercondyloid notch with the greatest ease, and without touching the bones immediately below the lower margin of the patella through the ligamentum patellæ as well as by the sides of the same (FIG. 252). The rod penetrated antero-posteriorly through the middle of the joint, and appeared in the popliteal space or several centimetres above the same. When the rod was pushed in at the median line of the extremity immediately below the patella, or through the ligamentum patellæ, it would also appear in the median line on the posterior aspect; but when it penetrated beside the ligamentum patellæ, the rod had to be forced through the joint in a somewhat oblique direction, and its point would appear on the posterior aspect one to two centimeters distant from the median line. The rod of the calibre of the Prussian *Langblei* could be pushed through the joint in the same direction without injury to the bone, if the flexion of the joint was increased to an angle of 150°; and, with a still greater flexion, at an angle of 130°, the perforation could be accomplished with ease by the third or the thickest of the rods. But in these greater flexions the point of the rod appeared in the posterior side of the thigh much higher, about 6 to 12 centimeters, above the popliteal space (FIG. 253), and these various experiments proved that the greater the flexion in which the knee was perforated the higher the exit wound came to be located. Nor could the joint be penetrated from side to side when the limb was in a straight position. But when the knee was bent to an angle of 165°, the front portions of the articular surfaces of the femur and tibia would separate sufficiently to allow the thinner rod to be pushed through the anterior third of the joint, and, on greater flexion, the space between the bones would open to such a degree that the iron rod of the calibre of the Prussian *Langblei* penetrated (FIG. 254). After withdrawing the rod and stretching the knee, essential local changes were observed in the aperture of the canal, which were brought about by displacement of the bones and of the skin. The knee pan elevated itself out of the *sulcus intercondylicus* upon which it had been held down, and the anterior parts of the articulating surfaces of the femur and the tibia fixed themselves so upon each other that one could neither penetrate from the front nor from the side towards the middle of the joint. But the wound in the skin suffered the greatest displacement. In the penetrations from before backward, the entrance aperture, which, when the knee was bent, was located immediately below the lower margin of the patella, either in the middle or at the side of the *ligamentum patellæ*, pushed itself upwards upon the lower part of the patella, so that this bone, being covered by periosteum and a mass of fibrous bands, formed the underlying base of the wound in the skin. The opening in the synovial membrane was thereby so completely closed that the synovia could not at all or only very sparingly ooze out

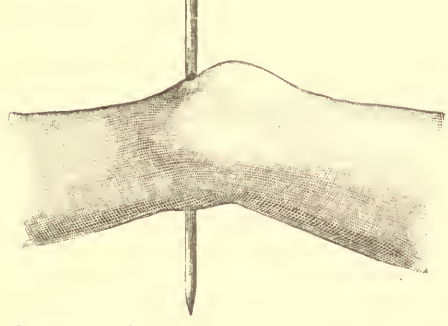

FIG. 252.—Perforation of the joint, at trifling genu-flexion from before backwards. [After SIMON.]

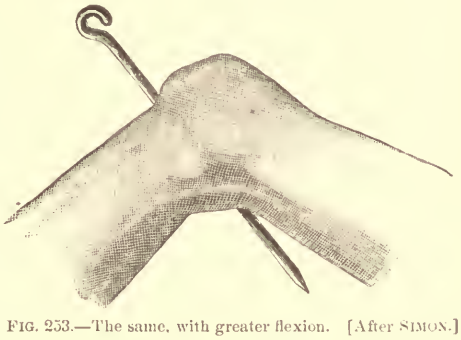

FIG. 253.—The same, with greater flexion. [After SIMON.]

Socin[1] clearly prove their feasibility. Hoffmann[2] states that among shot wounds of the knee, examples of missiles striking the knee, running around under the skin, and escaping on the opposite side, are very frequent; but no examples of such injuries were recorded from our civil war, and it can hardly be believed, as von Langenbeck[3] justly remarks: "That when the wound of entrance is in the middle of one side and the wound of exit in the middle of the other side of the joint, or when the former is in front, the latter in the bend of the knee, the ball should pass around the joint,—the angular projections of the condyles and of the edges of the patella would not permit it."

Analyzing the eight hundred and sixty-eight cases of shot fractures of the bones of the knee joint treated by conservation (TABLE LII, p. 367, *ante*), we find that in one hundred and seventeen cases the patella alone was injured, without lesion to the synovial cavity; eighty-four were successful, thirty proved fatal, and in three instances the result was undetermined, a fatality of 26.3 per cent., or 1.6 per cent. less than that of the cases of penetration of the joint capsule without bony lesion. Ten cases of fractures of the patella and head of tibia gave a mortality of 40.0 per cent., and of seventeen cases of fractures of the patella and condyles of femur 47.0 per cent. proved fatal. In the majority of the cases of these two groups the missile grazed the joint on the side, grooving or fracturing the bone and only slightly injuring the joint capsule. Forty-seven instances of fractures of the patella with primary lesion of the joint cavity gave a mortality of 53.1 per cent. Of the remaining six hundred and seventy-seven cases with fractures either of the condyles of the femur or the head of the tibia or both, or of the femur, tibia, and patella, two hundred and seventeen recovered, four hundred and fifty-four proved fatal, and six were undetermined, a mortality of 67.6 per cent., exceeding the mortality rate of primary amputations in the lower third of the thigh 18.9 per cent. On examining the reports of the eight hundred and sixty-eight cases of shot fractures of the bones forming the articulation of the knee, it was found that pyæmia supervened in seventy-seven instances, all proving fatal,—hæmorrhage in twenty-five, with nineteen deaths,—hospital gangrene in twenty, with seventeen deaths,—phlegmonous erysipelas in twenty, with eighteen deaths,—and tetanus in two, both resulting fatally. Fragments of bone or sequestra were removed in forty-four instances, twenty belonging to the group of fatal cases.

The consideration of the shot wounds of the knee joint treated by conservation will be concluded by an enumeration of such cases from other wars and from accidents in civil life.

---

from under the edge of the membrane. At the wound of exit upon the posterior aspect of the knee the displacement of the skin made itself also apparent, but in a reversed direction, namely, from above downward, entirely in accord with the fact that the anterior opening was made during tension, the posterior during great relaxation of the skin. Hence, too, the parallelism of the subcutaneous and of the skin wound on the posterior aspect was so completely broken up that with the finest probe we could only penetrate to the depth of the skin wound. By stretching, after transverse perforations, the anterior part of the articular end of the tibia laid itself against that of the femur, so that the synovial membrane, and with it the wound, was so compressed that the joint became closed beneath the gaping skin wound. The openings in the skin moved either upon the condyles of the tibia or of the femur. The displacement here was generally much less, and, in several instances, one could see beneath the entrance aperture of the skin the compressed opening in the synovial capsule. As a rule also synovia escaped from these transverse perforations. . . After these experiments and observations at the patient's bedside, no doubt really remains to be overcome that so inexplicable swiftly healing shot injuries of the knee are to be taken up as wounds in which the knee joint was perforated during flexion (to bring about a perforation of the joint the flexion need not be greater than that produced in ordinary walking by the advancing leg) by the missile without injury to the bone, and which through the displacing of the skin, on straightening the joint immediately after the injury, were changed from open into subcutaneous joint wounds."

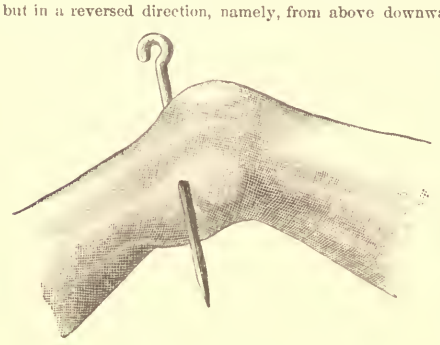

FIG. 254.—Transverse perforation. [After SIMON.]

pose that similar instances with fatal issue occurred during the same period, but were not reported by the attending surgeons. The percentage of fatality (48.3) must therefore be considered as too favorable. Attention should here be called to the favorable results claimed to have been achieved in the late Russo-Turkish War, 1877, by Professor Bergmann. Of twenty-one cases without bony lesion, eighteen recovered and the results in three were undetermined. None had died at the date of Professor Bergmann's report. Of thirty-one instances of shot fracture of the bones of the knee joint, two had undetermined results, twenty recovered, and nine died, giving the favorable mortality of 31.0 per cent. Professor Bergmann had hoped to have occasion to try Lister's antiseptic mode of treatment on the field of battle, and had provided himself with a complete outfit for that purpose; but he soon realized that in the excitement and confusion following an engagement it was impossible[1] to proceed with the care and precision requisite to a successful practice of Lister's somewhat

(*Cases of Gunshot Wounds of Knee Joint and Pelvis*, in *Virginia Med. Monthly*, Richmond, 1875, Vol. II, p. 35): Case of Lieut. G. L——, Co. I, 5th Infantry, aged 32, wounded in fight with Indians, September 9, 1874, near Washita River, Texas; fracture of patella and inner condyle of femur of left knee; recovery.—[42] KOBER (G. M.) (*Report of a Case of Gunshot Wound of the Right Knee-Joint and Right Hand*, in *Am. Jour. Med. Sci.*, 1876, Vol. LXXII, p. 427): Case of Serg't E. McM——, aged 24, accidentally wounded December 5, 1874; a load of duckshot entered the right knee, involving the tuberosity of the external condyle; lacerated wound of right hand; ring finger amputated through middle of second phalanx. Carbolated lotions applied to the knee without avail; injections of solution of iodine substituted; recovery, with anchylosed joint.—[43] VOLKMANN, *Verhandlungen der Deutschen Gesellschaft für Chirurgie*, VI Congress. Berlin, 1877, p. 39 (1 recovery). [44] CHANDLER (W. T.) (*Conservatism in the Treatment of Gunshot Wounds of the Knee*, in *Louisville Medical News*, 1877, Vol. III, p. 159): R. J——, aged 18; ball entered about 1 inch above patella, passed downward through the knee, fractured the femur, and emerged in the popliteal space; amputation advised but not allowed by patient; recovery, with probably a useful limb.—[45] GROSS (S. D.) (*A System of Surgery*, Philadelphia, 1872, 5th ed., Vol. I, p. 1039): Shot wound of the knee joint; recovery.

[1] BERGMANN (E.) (*Die Behandlung der Schusswunden des Kniegelenks im Kriege*, Stuttgart, 1878, p. 15): "In the night of the extensively planned and so gloriously successful crossing of the Danube, I was at the place of first dressing with a complete LISTER apparatus, with spray and excellently prepared gauze, aided by my Dorpat assistant, well schooled in the application of antiseptic dressings. The number of wounded was small, not exceeding 480, and plenty of helping hands were present. The wounded were brought to us in very little time after receiving their injuries—in short, I could not help taking hold, as I have just explained, of the gunshot fractures, and amongst them, also, of the knee wounds. But I soon desisted from my

complicated mode of treatment. Discarding the use of the spray apparatus, he dressed the wounds, immediately after the bleeding had ceased, thickly with salicylic cotton or jute, covering the same with a McIntosh rubber cloth, and applied the gypsum bandage without fenestration over the entire extremity and part of the pelvis.

Adding to the seven hundred and ninety-three cases collected in TABLE LIX, p. 417, the three hundred and thirteen cases of capsule wounds (page 28, *ante*) and the eight hundred and sixty-eight cases of shot fracture of the knee joint treated by conservation during the American war (TABLE LII, p. 367, *ante*), we have a total of one thousand nine hundred and seventy-four cases. The bony structure was not involved in four hundred and thirty-five, with three undetermined cases, three hundred and thirty-seven recoveries, and ninety-five deaths, or a mortality rate of 21.9 per cent. In one thousand five hundred and thirty-nine cases, lesion of the articulating ends of the knee joint was indicated; of these, six hundred and forty-seven were recoveries, eight hundred and seventy-one proved fatal, and in twenty-one the results remained undetermined, a fatality of 57.3 per cent.

Excision at the Knee Joint.—The results of the excisions at the knee joint performed during the late civil war, whether the operations were primary, intermediary, or secondary, were not very encouraging, forty-four of the fifty-four cases in which the issues were ascertained having terminated fatally, a mortality of 81.4 per cent., exceeding the mortality rate of the amputations in the thigh (53.8) by 27.6 per cent. Of the ten patients who survived excisions at the knee joint, one, Private W. M. Constable, 1st U. S. Cavalry (CASE 587, p. 387, *ante*), submitted to successful amputation at the junction of the middle and lower thirds of the thigh five days after the excision. Another, Private S. Miller, 1st Missouri Cavalry (CASE 632, p. 396, *ante*), was discharged the service and pensioned; but died two years and four months after the operation, from extensive suppuration of the leg and thigh and metastatic and pyæmic abscesses in various parts of the body. As regards the results of the instances of excisions at the knee joint, these cases, therefore, must also be considered as failures. Of the remaining eight cases three recovered with fair use of limb. In the case of Lieutenant *J. W. Harlee*, 1st South Carolina (CASE 584, p. 386, *ante*), the upper portion of the head of the tibia was excised. The patella was not removed. The leg is shortened three inches; but with the aid of a high heel and thick sole to the boot the patient can walk without crutches. Private *W. F. Jackson*, 6th South Carolina (CASE 585, p. 386, *ante*), in whose case the condyles of the femur and the patella were removed, has a "good sound leg which answers every purpose." In the case of Captain *Charles Knowlton*, 10th Louisiana (CASE 616, p. 391, *ante*), one and a half inches of the condyles of the femur, one inch of the tibia, and the patella were excised. Firm ligamentous union followed, and, when last heard from in 1877, the patient could "not only walk almost as well as ever, but could dance even round dances." Less favorable than in the three foregoing cases was the result in the case of Private J. Friel, 2d Kentucky (CASE 631, p. 395, *ante*). As in the case of *Knowlton*, the entire articulation, viz: one and a half inches of the condyles of the femur, one inch of the tibia, and the patella, was removed. The patient recovered with an anchylosed joint and four inches shortening; but the muscles of the limb below the knee became considerably atrophied and contracted, producing "*talipes*

efforts, for I was unable to disinfect, cleanse, and wash out scrupulously, to bandage and to place in position with the care that this dressing, according to my conviction and experiences, absolutely requires. The water which we drew at the banks of the Danube to solve our carbolic acid in was anything but clear and transparent, being, on the contrary, turbid with slime, mud, and sand. For the purpose of filtering, or even cooking itself, time and means were wanting. The spray apparatuses immediately became choked and spoiled, and in spite of a superabundant addition of carbol crystals, the water intended for disinfection retained its putrid odor."

equinus," while the muscular development of Captain *Knowlton's* leg remained excellent. In the case of Private Anson Rider (CASE 586, p. 386, *ante*), in which the condyles of the femur and the semilunar cartilages from the tibia had been excised, the patient was able to walk with the assistance of a cane at the time of his discharge ten months after the operation. Both lower extremities afterwards became paralyzed; but, according to the Pension Examining Surgeon's report, this may have been caused by malarial poisoning. Private E. Jewell's (CASE 629, page 394, *ante*) limb became atrophied and deformed, with contraction of the muscles and distortion of the foot. A portion of the head of the tibia and the head of the fibula had been excised. The evidence in the cases of Private J. E. Berry (CASE 630, page 394, *ante*) and Sergeant L. R. McWhorten (CASE 636, page 397, *ante*) is rather unsatisfactory, and beyond the fact that the former was mustered out forty-three days, and the latter furloughed twenty-seven days after the operation, nothing is known of their subsequent histories. As in the excisions at the elbow, the operations performed by the Confederate surgeons would seem to have given the best results; but it must be considered that, with the exception of the remarkable case of Captain *Knowlton*, the histories of the Confederate patients end with their discharge from hospital. In the cases of the Union soldiers the records are completed up to the present writing, and the remote results are found far less gratifying than the conditions of the patients at the time of their discharge from the service would seem to have warranted. For instance, in the case of Private Miller the success reported was so remarkable as to lead the editor, in the preliminary report,[1] published immediately at the close of the war in 1865, to doubt its authenticity. But, as stated above, and in CASE 632, p. 396, *ante*, subsequent reports, while verifying the account of the operative interference, revealed also the final fatal issue. These unfavorable results would seem to justify the declarations of Surgeon D. P. Smith,[2] U. S. V., that "this operation should be utterly discarded from the list of operations to be performed for gunshot injury;" of Surgeon H. S. Hewit,[3] U. S. V., that it is "highly questionable whether excision, gouging, or resection of any kind is to be permitted in traumatic surgery of the knee;" and of Dr. John Ashhurst, jr.,[4] that "excision of this joint should be banished from the practice of military surgery." The results of this operation in the late European wars (TABLE LX, p. 422) were equally discouraging. In the Schleswig-Holstein War of 1864, the mortality after knee joint excision was 85.7 per cent.; in the Austro-Prussian War of 1866, 86.6 per cent.; in the Franco-Prussian War of 1870–71, 80.0 per cent.; and in the Russo-Turkish War of 1876–77, 100. per cent.; and, while some of the European surgeons[5] yet hope for

[1] *Circular* No. 6, War Department, S. G. O., Washington, November 1, 1865. *Reports on the Extent and Nature of the Materials available for the preparation of a Medical and Surgical History of the Rebellion*, Philadelphia, 1865, p. 60.

[2] Surgeon D. P. SMITH, in charge of Fairfax Seminary Hospital, declares (*Experiences in Military Surgery*, in *American Medical Times*, 1863, Vol. VI, p. 100): "I am prepared to utterly discard this operation from the list of operations proper to be performed for gunshot or other *injury*, for this reason, even in civil practice, where every advantage of rest and careful nursing can be had, it is a doubtful remedy. But it is admissible because it is, or should be, always done for *caries*, which should most certainly be considered by every surgeon as imperatively demanding as thorough excision as *cancer*."

[3] Surgeon H. S. HEWIT, in his *Report of the Surgery of the U. S. A. General Hospital No. 5, at Frederick, Md.*, in 1862 (B. MSS. 33, p. 37), states: "Three partial resections of the knee were performed. The operation consisted in laying open the joint, removing the fragments, and smoothing the abraded and roughened surfaces. In one case the whole of the internal condyle and two-thirds of the head of the tibia were taken away, leaving the patella untouched. In the other cases the operation was confined to the head of the tibia. They all three failed, as might have been expected;" and on p. 43 adds: "The experiment of incising the knee joint and partially resecting signally failed. It was undertaken after consultation with several eminent civil and military surgeons, and I do not regret it, although the result of my experience has determined me never to repeat it. It is highly questionable whether excision, gouging, or resection of any kind is to be permitted in traumatic surgery of the knee."

[4] ASHHURST (JOHN, JR.), *The Principles and Practice of Surgery*, 2d edition, Philadelphia, 1878, p. 166.

[5] HEINE (C.) (*Die Schussverletzungen der Unteren Extremitäten*, Berlin, 1866, p. 395) regrets that excision at the knee joint was not more frequently performed, and hopes that in a future campaign the question as to its value may be more definitely settled. SENFTLEBEN (HUGO) (*Beobachtungen und Bemerkungen ueber die Indikationen, den Heilungsprocess, und die Nachbehandlung der Resectionen grösserer Gelenke*, in LANGENBECK'S *Archiv*, B. III, Berlin, 1862, p. 121) declares the introduction of the excision at the knee joint in military surgery a problem of the future, which he hopes will take the place of amputation in the thigh. BILLROTH (TH.) (*Chirurgische Briefe*, Berlin, 1872, p. 267): "The unfavorable results of this operation in war seem to prove that the therapeutic of knee joint injuries by resection, until now, has not accomplished any more than before;" but adds, on p. 271: "To discard primary resection altogether, the observations are yet too few." STARK (W.) (*Beiträge zu der Statistik und den Endresultaten der Gelenkresectionen*, in

better results in future wars, considering the number of observations on record too few to arrive at general conclusions, and while others,[1] basing their opinions generally on the more propitious results obtained in civil practice, approve of the operation under favorable circumstances, the most experienced[2] have declared themselves against the expediency of excision at the knee joint in times of war, and only perform it when amputation has been refused by the patient.

Of the fifty-seven patients on whom excision at the knee was performed, thirty-five were Union and twenty-two were Confederate soldiers. Of the former six survived, twenty-eight died, and one result remained undetermined, a mortality rate of 82.3 per cent. Of the latter four recovered, sixteen died, and the terminations in two cases could not be ascertained, a fatality of 80.0 per cent. In twenty-six instances—7 recoveries, 18 deaths, and 1 undetermined case—the right limb was injured; in seventeen—1 recovery and 16 deaths—the left; in fourteen instances the side injured was not recorded. In seven cases,[3] with 1 recovery, the excision at the knee was succeeded by amputation in the thigh.

V. CZERNY, *Beiträge zur Operativen Chirurgie*, Stuttgart, 1878, p. 325) trusts that "primary excision may retain its place in war surgery." SOCIN (A.) (*Kriegschirurgische Erfahrungen*, Leipzig, 1872, p. 169), although he performed 4 excisions at the knee joint, all of which proved fatal, concludes: "For all cases in which not only the nature of the injury, but also the surrounding circumstances permit it, I would recommend the primary excision. I live yet in hope that this operation will retain its place in military surgery." Professor v. NUSSBAUM, on the other hand, considers excision at the knee joint in peace as well as in war as a less dangerous operation than amputation in the thigh (*Ueber die Resectionen des Kniegelenks*, in *Aerztliches Intelligenz-blatt*, 1873, No. 9, p. 136): Dr. NUSSBAUM performed, during the Franco-Prussian War, 1870–71, 26 excisions at the knee joint (25 on the battlefield and 1 in hospital), and claims that 7 of these operations terminated successfully. But Professor E. GURLT, in his exhaustive work: *Die Gelenk-Resectionen nach Schussverletzungen*, etc., Berlin, 1879, p. 603, etc., thoroughly analyses the results in the alleged cases of recovery after excision in the knee joint by v. NUSSBAUM, and proves that in one case the excision was followed by amputation in the thigh terminating in death; that in another the patient died after 4 years of suffering from fistulous openings in the joint; that in the remaining four cases no subsequent history can be obtained, as the names given by Dr. NUSSBAUM, after a most careful scrutiny, cannot be found on the official muster rolls, nor among the claimants for pension; and Professor GURLT concludes, therefore, that of the excisions performed by v. NUSSBAUM only one can be claimed with certainty as a successful operation.

[1] RUPPRECHT (L.) (*Militärärztliche Erfahrungen*, Würzburg, 1871, p. 82): "Resection at the knee should not be performed unless immediately after the operation the measures are at hand for the most careful after treatment and perfect rest." KÜSTER (E.) (*Zur Resection des Kniegelenks im Kriege*, in *Deutsche Militairärztliche Zeitschrift*, 1873, p. 447): "Primary total excision of the knee joint for shot injuries, unless contravened by especially unfavorable circumstances, is preferable to amputation." FEHR (M.) (*Ueber die Resection im Kniegelenk*, in *Berliner Klinische Wochenschrift*, 1872, No. 46) concludes that: "In superficial shot injuries of the epiphysis of the femur or tibia, excision at the knee joint is indicated whenever the external circumstances are favorable and whenever by resection of the bony structure everything obnoxious can be removed. KOENIG (*Beiträge zur Würdigung der Resection des Kniegelenkes nach Schussverletzungen*, in *Berliner Klinische Wochenschrift*, 1871, No. 30, p. 355), from his experience in civil life and in military hospitals far remote from the seat of war, is inclined to favor excision at the knee in military surgery, while Oberstabsarzt J. ECKER (*Zur Total Resection des Kniegelenkes*, in *Wiener Medicinische Wochenschrift*, No. 34, 1877, p. 817) defends the operation on the ground of art and humanity.

[2] MACCORMAC (WM.) (*Notes and Recollections of an Ambulance Surgeon*, London, 1871, p. 119): "Excision for wounds of the knee may be successfully performed in civil practice, but is not justifiable in military." LÜCKE (A.) (*Kriegschirurgische Fragen und Bemerkungen*, Bern, 1871, p. 60): "Resection of the knee in war surgery has not recommended itself; I only perform it when amputation is refused; and I cannot boast of my success." COUSIN (A.) (*De la valeur de la résection du genou en temps de guerre*, in *Bull. Gén. de la Thérapeutique Méd. et Chir.*, Paris, 1873, T. 84, p. 161): "Mais, en temps de guerre, à la suite des batailles qui amènent fatalement l'encombrement des ambulances, la nécessité des évacuations successives des blessés avec des moyens de transport le plus souvent défectueux et partant l'impossibilité d'assurer aux opérés, d'une part, les soins minutieux dont ils doivent être l'objet, l'isolement, seule garantie certaine contre l'infection purulente et la septicémie, et, d'autre part, l'immobilisation absolue du membre blessé, condition *sine qua non* du succès de l'expectation ou de la résection, selon que l'on a adopté l'un ou l'autre de ces modes de traitement, toutes ces conditions défectueuses que nous venons d'énumérer expliquent et justifient la réprobation dont les chirurgiens militaires ont frappé la resection du genou." SPILLMANN (E.) (*De la résection du genou envisagée au point de vue du traumatisme*, in *Archives Générales de Médecine*, 1868, T. XI, sèr. VI, p. 690) cites 19 cases of excision at the knee joint with only 2 recoveries, and exclaims: "Toutes les illusions doivent tomber devant une pareille expérience; la résection ne peut s'appliquer à la chirurgie d'armée, si ce n'est dans des conditions très exceptionnelles." CZERNY (VINCENZ) (*Bericht ueber die im College Slanislaus in Weissenburg behandelten Verwundeten*, in *Wiener Med. Wochenschrift*, 1870, No. 59, p. 1429), on account of his many sad experiences, "could not persuade himself to perform knee joint resection again." Induced by the excellent results achieved in civil practice, Generalarzt BECK recommended and practised primary excisions in cases of shot fractures of the articular extremities without lesion of the blood vessels and without extensive laceration of the soft parts. "The results," he remarks (*Chirurgie der Schussverletzungen*, Freiburg, i. B. 1872, p. 883), "in no way came up to my expectations, although, with the exception of two cases, the operation was clearly indicated, the condition of the wounds was well suited to the operation, and, with one exception, the operations were skilfully performed, and in one instance only, too early transportation perhaps interfered with the result. Of the nine patients operated upon, seven died; of the remaining two, one had to have the thigh amputated afterwards, and one only, therefore, survived with preservation of the limb." LEGOUEST (L.) (*Traité de Chirurgie d'armée*, Paris, 1872, p. 579): "Nous doutons que la résection du genou puisse jamais être substituée d'une manière générale à l'amputation de la cuisse, dans la chirurgie d'armée." LOTZBECK (*Zur Kniegelenk-Resection nach Schussverletzungen*, in *Aerztliches Intelligenz-Blatt*, 1872, No. 32, p. 419) advises amputation in the lower third of the femur as preferable to excision. PIROGOFF (N.) (*Bericht ueber die Besichtigung der Mil.-Sanitätsanstalten in Deutschland*, etc., *im Jahre* 1870, Leipzig, 1871, p. 110) has not, in the seventy hospitals he visited, seen a single case of recovery after amputation in this joint. HUETER (C.) (*Klinik der Gelenkkrankheiten mit Einschluss der Orthopædie*, Leipzig, 1870–71, p. 507): "Resection of the knee joint in perforating shot wounds must not be performed when the accompanying fracture of the femur or tibia extends beyond the joint surface. It must also not be performed when the necessary guaranty cannot be had for careful attention and after treatment of the wounded."

[3] The cases in which the excision at the knee joint was followed by amputation in the thigh are: 1. Private W. E. L. Morrison, I, 29th Connecticut (TABLE XXXV, No. 388, p. 285, and CASE 607, p. 390), intermediary, in middle third of femur; fatal.—2. Private W. M. Constable, H, 1st Cavalry (TABLE XXXV, No. 43, p. 280, and CASE 587, p. 387), intermediary, in the middle third; recovery.—3. Corporal A. Glazier, B, 1st Minnesota (TABLE XXXVI, No. 366, p. 298, and CASE 606, p. 390), intermediary, in lower third; fatal.—4. Private J. W. Derr, E, 7th Maryland (TABLE XL, No. 128, p. 321, and CASE 605, p. 390), secondary operation in lower third; fatal.—5. Private S. Lininger, H, 74th Indiana (TABLE XL, No. 157, p. 322, and CASE 639, p. 397), secondary operation in lower third; fatal.—6, 7. Two unknown Confederate soldiers (TABLE XLI, p. 323, Nos. 9, 10, and CASES 611, 612, p. 390).

[1] VERNEUIL (A.) (*De la résection du genou*, in *Gazette Hebd. de Méd. et de Chir.*, Paris, 1862, T. IX, No. 46, p. 722): A young man, aged 18, in the fall of 1862 received a pistol shot in the knee joint; resection, five days after injury, of the articulating ends of the bone; cicatrized in seven weeks. In a communication to the *Société de Chirurgie* (*Gaz. des Hôp.*, Paris, 1864, No. 54, p. 215), at their meeting of April 27, 1864, VERNEUIL related the case of a poacher shot through the patella in 1863; neither femur nor tibia fractured; secondary excision of condyles of femur and tibia; recovery with anchylosis in 3½ months.—[2] NEUDÖRFER (J.) (*Handbuch der Kriegschirurgie und der Operationslehre*, Leipzig, 1872, Zweite Hälfte, Zweite Abtheilung, p. 1546, and GURLT (E.) (*Die Gelenk-Resectionen nach Schussverletzungen. Ihre Geschichte, Statistik, Endresultate*, Berlin, 1879, p. 278): Ferd. Blumauer, 27th Austrian Infantry Regiment, 1st Co., wounded February 6, 1864, at Oversee, by ricochet shot in the left knee. March 11, 1864, resection in hospital at Schleswig. Death April 2, 1864. Wasil Dumma, 30th Austrian Infantry, wounded at Oversee, March 5, 1864, in the left knee joint. Wound healed rapidly in seven weeks, but broke open again and suppuration ensued. Resection March 13, 1864. Amputation of thigh April 8, 1864. Death from exhaustion April 13, 1864.—[3] Prussian Staff Surgeon LŒWENHARDT operated in the case of Peter Jensen Ugle, 4th Danish Infantry, aged 27, wounded at Alsen, June 29, 1864; epiphysis of the right femur perforated antero-posteriorly, and external condyle shattered. July 13, 1864, resection, by H-incision, in hospital at Ulderup: about 4 inches of the femur, the patella, and a slice of the tibia removed. Recovered, and living in 1874 (C. HEINE, *Die Schussverletzungen der Unteren Extremitäten*, Berlin, 1866, p. 393, and GURLT, *loc. cit.*, p. 318).—[4] OCHWADT (A.) (*Kriegschirurgische Erfahrungen, etc., während des Krieges gegen Dänemark* 1864, Berlin, 1865, Anhang, *Tabelle der Operationen*, p. VI, No. 20, and GURLT, *loc. cit.*, p. 319): Sören Jacobsen, 9th Danish Infantry, wounded at Düppel, April 18, 1864, in the left knee; epiphysis of the femur split into three parts and joint opened; patella and tibia intact. Resection April 19, 1864, in hospital at Flensburg. Only the epiphysis of the femur was removed. Death May 7, 1864.—[5] ESMARCH'S case of Chremers Petersen, 9th Danish Infantry, wounded at Düppel, April 18, 1864, in the right knee; joint opened; resection in hospital at Broacker, April 21, 1864, by oval incision; patella retained. Death May 1, 1864 (GURLT (E.) (*loc. cit.*, p. 319).—[6] B. v. LANGENBECK twice excised the knee joint in the Schleswig-Holstein campaign of 1864: Jensen, 3d Danish Infantry, wounded at Alsen, June 29, 1864, through the right joint, shattering the bone; amputation was refused; subperiosteal resection, with inner longitudinal incision; patella retained, July 19, 1864. Death July 22, 1864. Stjernholm, 18th Danish Infantry, wounded at Alsen, June 29, 1864; penetrating shot wound of right knee joint. August 1st, subperiosteal resection of both carious ends of the joint. Death August 7, 1864 (GURLT, *loc. cit.*, p. 319).—[7] NEUDÖRFER (J.) (*Handbuch der Kriegschirurgie und der Operationslehre*, Leipzig, 1872, Zweite Hälfte, Zweite Abth., p. 1550, and GURLT, *loc. cit.*, p. 328): Kaspar Ruppnik, 1st Austrian-Mexican Chasseur Co., aged 41, wounded at Tlapacoyan, November 22, 1865, in the left knee; patella shattered, joint opened on the outer side. December 28th, resection. Living in 1872, his confessor writing from Schwarzenberg that the injured extremity is entirely stiff; that he is unable to do any hard labor, but can make considerable journeys with the aid of a cane.—[8] DAUVÉ (*Lésions traumatiques des deux genoux par coup de feu.—Articulation du genou gauche ouverte et broyée; résection du genou*, in *Rec. de Mém. de Méd. de Chir. et de Phar. Mil.*, Paris, 1867, T. XIX, 3me sér. p. 29): An Arab, nearly 20 years of age, was shot in both knees, on July 26, 1865, and, on the following day, was admitted into the hospital at Boghar. The upper part of the internal condyle of the right femur was fractured, but the capsule was not thought to be interested; two small pieces of bone were removed. The injury of the left limb was more severe. The internal condyle of the femur was crushed and the articulation largely opened. Amputation proposed but not allowed by the patient. July 27th, patella removed, and portion of condyles of femur and tibia excised. Death August 13, 1865.—[9] BAERWINDT, of Frankfurt, operated in the case of W. Rauch, 2d Silesian Grenadiers, No. 11, 8th Co., aged 26, wounded at Vettingen, July 26, 1866, in the left knee joint. September 2d, admitted into Garrison hospital in Frankfurt, a. M. Resection of both condyles in their middle September 12th; ball not found. Death October 5, 1866 (GURLT, *loc. cit.*, p. 397).—[10] BIEFEL (R.) (*Im Reserve-Lazareth. Kriegschirurgische Aphorismen von* 1866, in LANGENBECK'S *Archiv für Klin. Chir.*, Berlin, 1869, B. XI, p. 450): Joh. Palyo, 34th Austrian Infantry, 13th Co., aged 24, wounded at Königgrätz, July 3, 1866, in the left knee joint, shattering the patella. July 8th, admitted into reserve hospital at Landeshut. Resection August 9th. Death September 14, 1866.—[11] Dr. BURCHARDT excised the knee in the case of Josef Drozdz, 20th Austrian Infantry, aged 27, wounded at Königgrätz, July 3, 1866, close beneath the right knee. Resection July 10th, removing the patella and portions of the tibia and condyles of the femur. July 19th, hæmorrhage from popliteal artery: ligation of femoral artery. Death 20 minutes afterwards, July 19, 1866 (GURLT, *loc. cit.*, p. 487).—[12] Dr. BUSCH (SCHOLZ W.) (*Bericht über das Verwundeten-Spital Schloss Hradek bei Königgrätz vom 28. August bis zu dessen Auflösung am 6. November* 1866, in *Allgemeine Militärärztliche Zeitung*, 1867, S. 324, 357, and GURLT, *loc. cit.*, p. 486): Case of Joh. Necasek, Corporal, 74th Austrian Infantry, aged 24, wounded at Problus, July 3, 1866, in the right knee joint; the ball lodged and was removed

Amputations at the Knee Joint.—As indicated in TABLE LIV, on page 398, the fatality of one hundred and eighty-seven cases of amputation at the knee joint in which the

on the 6th day. July 13th, conveyed to Castle Hradek Hospital. Resection July 15th; fistulas, erysipelas, etc., ensued, and on July 3, 1867, at the solicitation of the patient, amputation was performed in the middle third of the thigh. Dr. BUSCH performed two additional operations in 1866: Alfred Graf, sublieutenant, Austrian Cuirassiers Regiment, No. 2, aged 18, wounded at Königgrätz, July 3, 1866, through the right knee joint, fissuring the femur extensively. Admitted into Castle Hradek Hospital. Resection, July 27th, of about four inches of the lower end of the femur and patella. Death Aug. 2, 1866. Anton Dunda, 8th Austrian Infantry, aged 25, wounded at Königgrätz, July 3, 1866, in the left knee joint. Admitted into Castle Hradek Hospital. August 1st, resection of about 1¾ inch of end of femur. August 6th, ligation of femoral artery below Poupart's ligament on account of arterial hæmorrhage. Death August 7, 1866 (GURLT, *loc. cit.*, pp. 487, 488).—[13] FIEBER (CARL) (*Chirurgische Studien und Erfahrungen mit Zugrundelegung der im italienischen Feldzuge des Jahres* 1866 *gemachten Beobachtungen*, in *Allgemeine Wiener Med. Zeitung*, 1875, No. 21, p. 202): Nicolo Pinosco, 1st Italian Grenadier Regiment, wounded at Custoza, June 24, 1866, in the left knee by a grenade splinter; patella shattered, joint opened. Admitted into hospital at Verona. Resection July 7th; pieces of patella entirely extirpated; both condyles removed. Death on the evening of July 9, 1866.—[14] Dr. HAHN operated on Carl Böhm, 42d Austrian Infantry, wounded at Königgrätz, July 3, 1866, through the right knee joint. Admitted, July 6th, into hospital at Horic. August 7th, resection of about 1 inch of tibia and fibula and 1½ inch of femur. August 27th, hæmorrhage, followed by death in a few minutes (GURLT, *loc. cit.*, p. 488).—[15] Dr. JUNG, of Frankfurt, a. M., operated in the case of Gustav Hornbogen, non-commissioned officer of Magdeburg Fusileer Regiment, No. 36, aged 23, wounded at Vettingen, July 26, 1866; penetrating shot wound of the knee joint. Admitted into Relief Hospital No. 4, Frankfurt, August 9th. Resection, August 15, 1866, of knee joint. Death from pyæmia August 19, 1866 (GURLT, *loc. cit.*, p. 398).—[16] KÖNIG (*Beiträge zur Resection des Kniegelenkes*, in *Archiv für Klin. Chir.*, 1868, B. IX, s. 465, and GURLT, *loc. cit.*, p. 485): Leopold Anzenberger, Austrian Infantry Regiment, No. 49, aged 25, wounded near Aschaffenburg, July 14, 1866, in the left knee joint. On September 10th he was admitted into hospital at Hanau. Resection, September 11th, of about 2½ centimetres (broad) of the femur, the fractured patella, and a piece of the tibia about a centimetre broad. Living October 19, 1874, having been engaged in shoemaking for three years. Leg shortened 2 inches.—[17] B. v. LANGENBECK (*Ueber die Schussfracturen der Gelenke, etc.*, Berlin, 1868, p. 33, and GURLT, *loc. cit.*, p. 398): Case of Simon Bach, Pommeranian Field Artillery, aged 24, wounded at Königgrätz, July 3, 1866; right knee joint shattered by splinter of grenade; capsule opened. Admitted into hospital at Milowic, July 30th. Subperiosteal resection of the knee joint. Death August 5, 1866.—[18] Dr. MIDDELDORPF operated on Constantin v. Memerty, 2d Lieutenant, 7th East Prussian Infantry, No. 44, aged 23, wounded at Königgrätz, July 3, 1866. Besides two slight flesh wounds, the left knee joint was shattered by a piece of grenade, the patella carried off, and the joint opened. Resection, July 10th, in hospital at Königinhof. Death from pyæmia, July 27, 1866 (GURLT, *loc. cit.*, p. 398).—[19] Surgeon RAST excised the knee in the case of Michael Maier, 1st Bavarian Infantry, aged 26, wounded at Vettingen, July 26, 1866, at inner condyle of left knee. Admitted into hospital at Würzburg August 18th; resection, August 30th, of condyles, patella, and a slice of tibia. Death, September 17, 1866, from pyæmia (GURLT, *loc. cit.*, p. 418).—[20] Professor KARL TEXTOR, in the case of Andreas Jörg, 9th Bavarian Infantry, 3d Co., resected the knee joint in hospital at Würzburg. Death August 16, 1866 (GURLT, *loc cit.*, p. 419).—[21] Generalarzt WAGNER, in the case of Franz Skazel, Field Chasseur Battalion, No. 27, aged 20, wounded at Königgrätz, July 3, 1866, in the left knee, and admitted into hospital at Görlitz on July 30th, removed, on August 31st, the patella. Death September 29, 1866 (GURLT, *loc. cit.*, p. 488).—[22] Surgeon BUXMANN: Case of Corporal H. Schildgen, Hessian Sharpshooter Corps, aged 30, wounded accidentally, September 16, 1866, in the right knee; joint opened, tibia and fibula uninjured. Resection of knee joint about 16 or 18 hours after injury; removal of patella, head of fibula, articular portion of tibia, and the splintered femur 1½ inch above its articulating extremity. Recovered July 21, 1875; shortening 10 centimetres; walks about all day, but feels very tired in the evening. Cicatrix adherent; total anchylosis of joint; leg entirely straightened; can walk up hill easier than down hill; uses no supporting apparatus (GURLT, *loc. cit.*, p. 1191).—[23] THOMPSON (HENRY) (*Gunshot Wound of the Knee—Excision of the Knee Joint*, in *The Dublin Quarterly Journal of Medical Science*, 1868, Vol. XLVI, p. 27): Case of Peter McSorley, a carpenter, shot February 29, 1868, in his bent right knee. Admitted into Tyrone County Infirmary at Omagh. March 1, 1868, resection of 2½ inches of the femur, a very thin slice of the head of the tibia, and all the fragments of the patella, shot, and pieces of lead. For weeks afterwards pieces of bone, lead, shot, etc., continued to discharge. July 1, 1868, patient able to go about with the aid of a crutch and cane and without splints, limb being shortened about 1½ inch.—[24] OATMAN (IRA T.) (*Excision of the Knee Joint*, in *Pacific Med. and Surg. Jour.*, 1869, Vol. III, N. S., p. 56): C. G——, of Yolo County, California, aged 16, wounded March 10, 1868; penetrating shot wound of knee joint, resulting in caries. Resection May 21, 1868; removal of lower portion of condyles, anterior articular surface of femur beneath the patella, the patella, head of tibia, and fragments of fibula. October 15, 1868, amputation of thigh on account of continuous progress of caries of the femur and leg; recovered.—[25] For details of the cases of excision of the knee joint of the Franco-Prussian War of 1870–71, the reader is referred to the exhaustive work of Professor E. GURLT, *Die Gelenk-Resectionen nach Schussverletzungen, etc.*, Berlin, 1879, pp. 602, etc. From a careful and critical examination of the sources at his command, Dr. GURLT collects 75 authentic cases of excisions at the knee joint performed during that short but decisive struggle: 15 were successful and 60 proved fatal, a mortality rate of 80.0 per cent.—[26] NEWMAN (WM.) (*Gunshot Wound of Right Knee Joint, twenty-five years ago—Removal of Lower Half of Patella (carious), and of shot imbedded in inner Condyle of Femur, from a patient aged* 55, in *St. Bartholomew's Hospital Reports*, London, 1874, Vol. X, p. 392), in the case of J. T——, accidentally shot in the right knee. Excision March 29, 1871. Recovery, with bony anchylosis.—[27] MINER (J. S.) (H. CULBERTSON, *Excision of the Larger Joints of the Extremities.* Prize Essay, in *Trans. Am. Med. Assoc.*, Philadelphia, 1876, Supp. to Vol. XXVII, p. 186, Case No. 37): Thomas S. Cobb, of Buffalo, N. Y., aged 35, received, on November 8, 1871, a pistol shot in the articulating surface of the tibia. Resection, on November 10th, of both surfaces of joint. Died 15 days afterwards of pyæmia.—[28] Dr. MEUSEL (*Eine Kniegelenkresection nach Schussverletzung*, in *Berliner Klin. Wochenschrift*, 1875, XII Jahrg, S. 272): Case of Zeiss, aged 25, wounded November 1, 1873, by a revolver shot in the left knee; ligamentum patellæ perforated, missile lodged in the epiphysis of the tibia about 5 centimetres deep. Resection November 9, 1873, removing a piece from the condyles of femur 4 centimetres thick, without touching the patella, and reseeting the tibia so as to leave the fibula joint unopened. Discharged from treatment April 8, 1874, walking on crutches; he subsequently accustomed himself to walk with a light cane; shortening 5 centimetres.—[29] REYHER (G. TILING, *Bericht über* 124 *im Serbisch-Türkischen Kriege im Baracken-Lazareth des Dorpater Sanitäts-Trains zu Swilainatz behandelte Schussverletzungen*, Dorpat, 1877, pp. 67, 68, and GURLT, *loc. cit.*, p. 1160) performed 3 excisions at the knee joint during the Russo-Turkish War, 1876–78: Rista Bokowitsch, aged 35, wounded September 18, 1876, in the external condyle of the right femur; ball removed. Resection of knee joint September 21, 1876, at Swilainatz. Death September 22, 1876. Radojiza Schiwanowitsch, aged 40; admitted into hospital at Swilainatz, September 2, 1876, with penetrating shot wound of left knee joint, fracturing the femur, received several days previous. Resection of entire lower portion of femur. Died September 13, 1876. Gaja Miliwojewitsch, aged 34, admitted into hospital at Swilanatz, August 22,1876, with a shot wound of left knee joint received two and a half weeks previously. Resection of both condyles of femur, August 23, 1876. Death from pyæmia August 31, 1876.—[30] BERGMANN (E.) (*Die Behandlung der Schusswunden des Kniegelenks im Kriege*, Stuttgart, 1878, pp. 30, 31): Aleksei Neboschenko, Russian Regiment Wolhynien, aged 27, wounded at the crossing of the Danube, June 15, 1877, in the right knee joint. Primary resection of the shattered condyles of femur. Death July 2, 1877, from pyæmia. [31] KADE (E.) (*Das temporäre Kriegslazareth des Ressorts der Anstalten der Kaiserin Maria im Kloster Mariahimmelfahrt bei Sistowa*, in *St. Petersburger Med. Wochenschrift*, 1877, S. 381. 1878, s. 19): Peter Petrunja, 14th Russian Sharpshooter Battalion, wounded on the Nicolai Mountain, August 13, 1877, through the left knee. Resection, October 5, 1877, in hospital at Sistowa, of articulating ends of femur and tibia. Death October 8, 1877.—[32] RUDDUCK operated twice during the Russo-Turkish War, 1876–78 (*Société ottomane de secours aux blessés et malades militaires constituée d'après la Convention de Genève*, Vol. III, *Ambulances fixes et mobiles du Croissant rouge*, Constantinople, 1878, pp. 137, 232): Ahmed Ibrahim, wounded September 8, 1877, in the right knee. Resection, September 22, 1877, of the condyles and articular facet of the tibia, in hospital Le Mevle-Hane, at Philippopolis. Hassan Ali, penetrating wound of right knee joint; ball in one of the condyles of the femur. Resection, October 25, 1877, of knee joint, in field hospital No. 5, at Orkhanie. Death from pyæmia.—[33] RICHARDSON (A. P.) (*Proceedings of the Connecticut River Valley Medical Association*, in *Boston Med. and Surg. Jour.*, 1878, Vol. XCVIII, p. 43): A girl, aged 14, accidental shot wound of knee joint, in 1876; excision of articular end of bones by Dr. TWITCHELL, of Keene, N. H. Recovery, with 2 inches shortening and a useful leg.

final issues were determined was 56.6 per cent., viz: fatality of one hundred and seven primary operations, 53.2 per cent.; of fifty intermediary, 68.0 per cent.; of twenty-six secondary, 53.8 per cent.; and of four operations in which the date of the amputation was not ascertained, 25.0 per cent. These results do not sustain the opinion expressed in the preliminary report, issued in 1865, that the mortality, especially of primary amputations in the lower third of the thigh, is much larger than that of the exarticulations at the knee joint. It will be remembered that the fatality of the amputations in the lower third of the thigh was 53.6 per cent., and of the primary amputation in the lower third only 48.7 per cent. (TABLE XXIX, p. 213), or 3 and 4.5 per cent., respectively, less than that of the corresponding groups of amputations at the knee joint, and the former operation would, therefore, seem to give a better chance for life than the latter. It must also be taken into consideration that in 8, or nearly 10 per cent., of the eighty-one cases of recovery after amputation at the knee, amputation in the thigh subsequently became necessary.

The mode of operation in amputations at the knee joint has been varied in many ways: by a semilunar incision in front and a long posterior flap behind, as practised by Hoin, in 1764;[1] by the long anterior flap of Léveillé;[2] by the anterior and posterior semicircular flaps of N. Smith,[3] the patella being retained; by the circular method of Velpeau,[4] three or four inches below the patella; by the oval method of Baudens,[5] consisting of one flap, long anteriorly and short posteriorly; by the lateral flaps of Rossi;[6] and by three subcutaneous flaps (one anterior and one posterior, the latter split up along the middle of the popliteal space) from the circumference of the upper part of the leg, as proposed by Pancoast.[7] Syme,[8] in 1845, made a semilunar incision on a line with the upper edge of the patella and a long flap from the calf of the leg, after the manner of Hoin, but he removed the condyles and the patella. Carden,[9] since 1846, cut an anterior semioval skin flap, removing the patella and portions of the condyles of the femur. Operations similar to Carden's were performed by Melchiorj[10] in 1850 and 1851, but the patella was retained in these cases. In 1857, R. Gritti proposed to cut an anterior rectangular flap, to saw through the condyles of the femur, to remove a segment of the inner portion of the patella and to place the sawn surfaces in apposition, to secure in this manner a sound surface to

[1] BRASDOR (*Sur les amputations dans les articles*, in *Mém. de l'Acad. Roy. de Chir.*, Paris, 1774, T. V, p. 773), who practised the operation at Dijon, in 1764, on a laborer who had fallen from a building. [2] LÉVEILLÉ (J. B. F.), *Nouvelle doctrine chirurgicale*, Paris, 1812, T. IV, p. 586.

[3] SMITH (NATHAN) (*On Amputation at the Knee Joint*, in the *American Medical Review and Journal*, 1825, Vol. II, p. 370) marked "two points one on the out and the other on the inside of the limb, the latter half an inch below the head of the tibia, and the other opposite to it. Then draw a semicircular line from one point to the other, over the anterior part of the leg, and in such a direction that its lower part shall touch the lower part of the tubercle on the tibia into which the ligament of the patella is inserted, and then mark another circle on the posterior part of the leg, exactly corresponding to the former. The above lines limit the two flaps, the former of which will be formed of the patella and its ligament, together with the investing integuments, and the latter of the head of the gastrocnemius, the tendons of the flexor muscles, and the popliteal blood-vessels and nerves. The operator should first raise the anterior flap with the patella, which will expose the anterior part of the joint and render the division of the lateral ligaments easy. Two or three strokes of the knife will then complete the section of the lower flaps, with the crucial ligaments."

[4] VELPEAU (A.), *Mémoire sur l'amputation de la jambe dans l'articulation du genou, et description d'un nouveau procédé pour pratiquer cette opération*, in *Archives Générales de Médecine*, 8me année, T. XXIV, 1830, p. 58.

[5] BAUDENS (L.) (*Clinique des plaies d'armes à feu*, Paris, 1836, p. 537, and *Désarticulation coxo-fémoral et tibio-fémoral*, in *Bulletin de l'Acad. Roy. de Méd.*, Paris, 1836, T. I, p. 324) recommends a combination of the oval and flap methods. A long oval flap anteriorly, commencing five inches below the patella, is dissected and turned up; the ligaments, muscles, and vessels are next divided by a circular incision, the articulation is opened, and the semilunar cartilages and crucial ligaments detached as in the circular process of VELPEAU.

[8] SYME (JAMES), *Surgical Cases and Observations*, in *London and Edinburgh Monthly Journal*, 1845, p. 339.

[9] CARDEN (HENRY D.) (*On Amputation by Single Flap*, in *British Medical Journal*, 1864, Vol. I, p. 416): It consisted "in reflecting a rounded or semi-oval flap of skin and fat from the front of the joint; dividing everything else straight down to the bone; and sawing the bone slightly above the plane of the muscles; thus forming a flat-faced stump with a bonnet of integument to fall over it." The patella was not retained in this operation.

[10] MELCHIORJ (G.) (*Caso di amputazione sopracondiloidea del femore col metodo del dott.* ROCCO GRITTI, *cioè con lembo patellare, per ferita da arma da fuoco; preceduto da altri due, in cui fu conservata la rotella disarticolando il ginocchio ed amputando ai condili femorali*; in *Annali Universali di Medicina*, Milano, 1857, Vol. CC, pp. 370, 371); but in these operations the *entire* patella was retained. One of the patients on whom the amputation was performed recovered from the operation, but died of recurring cancerous tumors four and a half months after the operation. The patella, deprived of its cartilage, was found, held by adhesions, in the intercondyloid notch; the skin of the flap adhered to the condyles. In the other case, the operation was performed at the level of the condyles for a railroad accident, in 1851. The anterior flap sloughed, but finally the patella became anchylosed to the outer part of the femur and the patient recovered with an excellent stump.

the stump.[1] From the records it would seem that this mode of amputating at the knee joint was practised once only during the late civil war in the case of Private C. H. Rist, 36th Wisconsin (CASE 492, p. 318, and TABLE LV, p. 402, No. 38), who subsequently underwent secondary amputation in the lower third of the thigh; although, as already stated on page 357, *ante*, similar procedures were employed by Surgeon B. A. Vanderkieft, U. S. V., and Assistant Surgeon J. W. S. Gouley, U. S. A., in two instances of amputations in the lower third of the femur. In the Danish War of 1864, the Austro-German War of

[1] R. GRITTI, *Dell' amputazione del femore al terzo inferiore e della disarticolazione del ginocchio. Valore relativo di cadauna, coll'indicazione di un nuovo metodo denominato amputazione del femore ai condili con lembo patellare*, in *Annali Universali di Medicina*, Milano, 1857, Vol. CLXI, p. 5. The author, who found no occasion to practise the amputation on the living subject, gives, on page 18, a minute description of the operation, of which the following is a brief outline: An incision is made from the upper edge of the head of the fibula transversely across the leg, about one inch below the patella, to the inner tuberosity of the tibia. From the extremities of this incision a vertical cut is made upward to the level of the middle of the patella. The rectangular flap thus outlined is dissected, the joint is opened by cutting through the ligamentum patellæ. The patella is then thrown back, and a segment, about two lines in thickness, removed from the inner surface by a small saw. The condyles of the femur are sawn through. The posterior flap is then made by an incision direct to the bone, connecting the upper extremities of the lateral cuts. This flap is separated from the femur for a short distance, the periosteum cut through, and the limb removed. The vessels are ligated, the sawn bony surfaces are placed together, and the edges of the flaps secured by several interrupted sutures. Professor J. NEUDÖRFER, in the preface to his *Handbuch der Kriegschirurgie. Ein Vademecum für Feldärzte*, Leipzig, 1864, Erste Hälfte, p. IX, claims that he performed an operation similar to GRITTI'S in 1859: "The work of GRITTI was unknown to me; but it struck me, in the fall of 1859, to combine exarticulation at the knee with resection, and to practically test it," and on p. 1559 of the Zweite Hälfte states that he performed the operation in 1859, but he fails to give details of the case. In an article, *Beitrag zur Amputation*, in *Vierteljahrschrift für die Praktische Heilkunde*, Prag, 1860, Vol. I, p. 80, Professor SZYMANOWSKY advocates GRITTI'S mode of operation, and details his experimental efforts on the cadaver; but at that time he found no occasion to employ this method on the living subject. SAWOSTITZKI seems to have been the first to practically test GRITTI'S operation, in 1862. The case is published in the *St. Petersburger Medicinische Zeitschrift*, 1862, B. III, p. 372: The patient, aged 19, fell from a wagon and received a fracture of the right leg. The operation was performed according to GRITTI'S mode as described by SZYMANOWSKY; the sawing of the patella caused the only difficulty; the sawn surfaces of the femur and patella fitted readily; the wounds healed principally by first intention. On the sixth day after the operation the patella was found to have been drawn upwards on the anterior surface of the femur by the quadriceps, and could not be replaced. The patient recovered with a good stump. The first recorded operation after shot injury is a case reported by SZYMANOWSKY (*Die Rechtfertigung der* GRITTI'*schen Operation durch Wort und That*, in *Vierteljahrschrift für die Praktische Heilkunde*, Prag, 1866, B. II, S. 38): "February 5, 1863, shot fracture of leg, gangrene; GRITTI'S operation with dissection of the synovial pouch; gangrene of thigh; death. The patella was found unmoved upon the sawn surface of the femur." In the Schleswig-Holstein War of 1864, 10 cases of GRITTI'S operation were reported.—A. LÜCKE (*Kriegschirurgische Aphorismen aus dem zweiten Schleswig-Holsteinschen Kriege im Jahre* 1864, in LANGENBECK'S *Archiv für Klin. Chir.*, Berlin, 1866, B. VII, pp. 23, 24, 134, 147) reports 4 cases.—2. Christian Balzer, 24th Regiment, shot wound of left knee joint, June 29, 1864; amputation June 30th, by Surgeon SCHILLING; fatal.—3. Thomas Thomsen, 9th Danish Infantry, shot wound of right knee, April 18, 1864; amputation April 27th, by Dr. LÜCKE; death May 1, 1864.—4. Carl Neumann, 4th Guards, shot wound of right knee joint, April 18, 1864; amputation by Dr. LÜCKE, April 26th; recovery.—5. Hoffmann, wounded in right knee, February 2, 1864; amputation February 10th, by Dr. LÜCKE; death about the end of February. Six other cases of the War of 1864 are mentioned by C. HEINE (*Die Schussverletzungen der unteren Extremitäten, etc.*, in LANGENBECK'S *Archiv für Klin. Chir.*, 1866, B. VII, p. 607.—6. Prussian soldier, shot fracture of the leg. Operation by Generalarzt von LANGENBECK; fatal.—7. Primary operation by Professor ESMARCH, at the hospital at Broaker, April 18, 1864, for shot wound of upper extremity of tibia; fatal.—8. L. Chr——, 8th Prussian Grenadiers, comminution of left leg, April 18, 1864. Operation, April 18, 1864, by Staffsurgeon OCHWADT, at Flensburg; fatal. (See also OCHWADT, *Kriegschir. Erfahrungen*, Berlin, 1865, No. 18 of Table of Operations).—9. Private J. K——, 9th Danish Infantry, wounded April 18, 1864; operation, April 21st, by Staffsurgeon FISCHER, at the Latin School Hospital at Flensburg, for shot fracture of the tibia with splintering into knee joint; the patient died eight days after the operation. The autopsy showed that no consolidation of the femur and patella had taken place.—10, 11. After the naval engagement at Helgoland, in 1864, two of these operations were performed; one at the hospital at Altona, by Dr. STEINLECHNER (H. KUCINIC, *Bericht über die Verwundeten, der K. K. Kriegsmarine*, in *Allgemeine Militärärztliche Zeitung*, 1864, B. V, p. 52): Sailor A. Gasparo, of Frigate Radetzky, shot fracture of left leg, May 9th; amputation after GRITTI, May 13th; recovery. The other (HEINE, *loc. cit.*, p. 608, and SALZMANN, *Die* GRITTI'*sche Operationsmethode und ihre Verwerthung in der Kriegschirurgie*, in B. VON LANGENBECK'S *Archiv für Klinische Chirurgie*, Berlin, 1880, B. XXV, p. 662) was the case of an Austrian naval cadet, wounded in the same engagement; amputation after GRITTI on the day of the injury, May 9, 1864. It is stated that union of the patella had taken place, but that on his return to Austria the patient fell upon his stump, necessitating amputation in the middle third of the thigh.—12. MELCHIORJ (G.) (*Annali Universali di Medicina*, 1867, Vol. CC, p. 374): P. Pietro, 5th Italian Artillery, aged 27, shot in the right leg, July 21, 1866. GRITTI'S amputation August 16th; recovery. Of the Austro-Prussian War of 1866, seven operations after GRITTI'S method are reported by SALZMANN (*loc. cit.*, p. 669, etc.).—13. Austrian soldier, aged 17, comminution of left leg by shell, at Königsgrätz, July 3, 1866; operation July 3d; healed by first intention; August 12th, recovered.—14. Prussian Infantry soldier, comminution of bones of right leg, Königsgrätz, July 3, 1866; operation at Castle Prim, July 15th, by Dr. BUSCH; death same day.—15. Franz Wulichowski, comminution of lower third of left tibia and fibula, and of right elbow joint; July 15th, resection of elbow joint; July 27th, GRITTI'S amputation at knee joint; death August 15, 1866; operation by Dr. BUSCH.—16. Johann Bielin, 8th Austrian Infantry, fracture of tibia and laceration of the peronæus, July 3, 1866; operation by Dr. BROCK, July 27, 1866; death from pyæmia.—17. Austrian soldier, shot fracture of head of tibia, July 3d; amputation at Nechanic, August 10, 1866, by Dr. BUSCH; death from pyæmia, August 10, 1866.—18. Austrian soldier, shot fracture of leg; operation at the hospital at Nedelist, by Dr. SPANNER; death 50 days after the operation.—19. O. Weiser, 3d Baden Infantry, shot fracture of right leg, Werbach, July 24, 1866; operation by Dr. MÜLLER, August 2d; death August 9, 1866. Of the Franco-Prussian War of 1870–71, Staffsurgeon SALZMANN (*loc. cit.*, p. 674, etc.) collects 15 cases, viz: 20. G——, 94th French Infantry, shell laceration of both calves, August 22, 1870; GRITTI'S operation at the knee on one limb; amputation in the thigh on the other, August 23d; operation by Dr. MÜLLER; death August 24, 1870.—21. T. H——, 1st French Infantry, shell fracture of left leg, August 18, 1870; operation, August 24th, by Dr. MARQUARDT; death.—22. Private A. Ihl, 88th Infantry, comminution of left leg, September 1, 1870; amputation, September 4th, by Dr. LANG (?); recovery, with good stump.—23. A. Brauer, 3d Grenadiers, splintering of left tibia, August 18, 1870; GRITTI'S operation by Dr. MATZ, September 7th; recovery, with tender stump.—24. Reimann, 14th Bavarian Infantry, shot fracture of right leg; gangrene; operation, September 13th, in hospital at Aix-la-Chapelle, by Dr. BRANDIS; death in a week.—25. C. G. Renner, 46th Prussian Infantry, shot fracture of right leg; GRITTI'S amputation performed by Dr. STAHL, October 17th, at the 7th field hospital of the IXth Corps; recovery, with good stump.—26. W. Pluta, 1st Posen Infantry, No. 19; groove shot of right tibia, with opening of the joint, October 7, 1870; amputation by Dr. MÜLLER, October 25th, at the 7th field hospital of the Xth Corps at Hagondange; death October 31, 1870.—27. Private P. H. KÜPPER, 65th Infantry, comminution of left leg, October 28, 1870; operation by Dr. MÜLLER, November 19th, at Hagondange; death from pyæmia, November 24, 1870.—28. J. Ollagnon, 13th French Infantry, shot fracture of left tibia, August 18, 1870; operation by Dr. MÜLLER, in hospital at Nancy, March 2, 1871; recovery in 29 days.—29. Lieut. W. von du Prel, Infantry body guard, shot fracture of left knee joint, September 1, 1870; GRITTI'S operation, by Professor v. NUSSBAUM, at Bazeilles, September 1st; September 14th, resection of exposed portion of femur; death September 25, 1870.—30. P. Zoll, 10th Bavarian Infantry, shot fracture of left leg at Remilly, August 31, 1870; operation by Dr. LOTZBECK, September 8th; death September 17, 1870.—31. O. Willner, 9th Bavarian Infantry, aged 24, shell fracture of leg near the knee joint, October 7, 1870; GRITTI'S amputa-

1866, and the Franco-Prussian War of 1870–71, Gritti's operation was performed in a number of instances, and, in 1870, a modification of Gritti's plan was presented by Stokes,[1] but the results of these operations in war surgery have not been very favorable, and the opinions of military surgeons generally are recorded against its performance.[2]

In nine of the one hundred and eighty-nine cases of exarticulation at the knee the condyles of the femur and the patella were removed; in sixteen the condyles were removed and the patella retained; in seven the condyles were retained and the patella removed; in twenty-eight the condyles and the patella were retained; and in one hundred and twenty-nine instances this point was not indicated.

Regarding the value of the stump after knee joint amputations, the records would seem to confirm the opinions of Velpeau, Stephen Smith, Markoe, and Syme,[3] that the stump formed by the articular surface of the lower extremity of the femur is as well, and perhaps better adapted to the successful wearing of an artificial limb than the thigh stump. Of the eighty-one cases of recovery after amputation at the knee, the condition of the stump is known in sixty instances; in forty it is recorded as sound and healthy, and, in twenty, as tender or painful, or as not allowing the use of an artificial apparatus.

---

tion, by NEUHÖFER, October 8th; discharged the service July 17, 1871, and died in February, 1872; stump had healed after tedious exfoliations of small particles of bone, but union of bone of the cut surfaces of the femur and patella had not taken place.—32. F. Borron, 9th French Chasseurs, aged 29, shot fracture of right leg, October 11, 1870, at Artenay; operation by v. NUSSBAUM, October 11th; result undetermined.—33. J. Krum, 1st Bavarian Jægers, shot fracture of left leg, October 11, 1870; operation, October 15th, by LOTZBECK; result unknown.—34. G. Kofler, 3d Bavarian Infantry, shot fracture of left knee joint, October 11, 1870; operation by LOTZBECK, October 21st; death October 25, 1870. The results of two of the 34 amputations at the knee after GRITTI'S method, here cited, are not recorded; 10 had successful and 22 fatal issues, a mortality rate of 68.7 per cent.

[1] STOKES (WILLIAM) (*On Supra-Condyloid Amputation of the Thigh*, in *Medico-Chirurgical Transactions*, London, 1870, Vol. LIII, p. 180). The author claims that his mode differs from GRITTI'S in the following particulars: "1. That the femoral section is made in all cases at least half an inch above the antero-superior edge of the condyloid cartilage. 2. That in all cases the cartilaginous surface of the patella is removed. 3. That the flap is oval, not rectangular. 4. That there is a posterior flap fully one-third of the length of the anterior flap." In regard to the second point of modification, Dr. STOKES remarks that "much importance was not attached by GRITTI to the removal of this portion of the bone," and, in proof thereof, cites three cases reported by MELCHIORJ, in two of which the articular surface of the patella was not removed. Dr. STOKES evidently overlooked the fact that these two operations were performed 6 and 7 years before Dr. R. GRITTI proposed his osteoplastic operation, while the third operation, in which the inner surface of the patella was removed, was performed in 1866, or 9 years after Dr. GRITTI'S plan had been published. Dr. GRITTI (*loc. cit.*, p. 18) clearly insists upon the division of the patella, and, in FIG. III, at the conclusion of his article, delineates the manner of the division.

[2] BECK (B.) (*Kriegs-Chirurgische Erfahrungen während des Feldzuges* 1866, Freiburg, i. B., 1867, p. 62): "GRITTI'S operation, which must be designated as one entirely without purpose, is to be rejected as one too complicated, having no advantages and only disadvantages." ZEIS (E.) (*Einige Bemerkungen zur Würdigung der Exarticulation des Unterschenkels im Kniegelenke*, in *Arch. für Klin. Chir.*, Berlin, 1866, B. VII, p. 770): "I confess that my great predilection for this operation, by which, when successful, unquestionably great advantages are gained for the patient, has greatly diminished, and I, therefore, do not feel encouraged to perform the operation after GRITTI, as the dangerous consequences alluded to by me must be the same." Dr. R. F. WEIR (*On* GRITTI'S *Supra-condyloid Amputation of the Thigh*, in the *Medical Record*, New York, 1879, Vol. XV, p. 342) tabulates 76 operations after GRITTI, of which 54 recovered and 22 died, and remarks, on p. 341: "For gunshot wounds or compound fractures involving the condyles of the femur, its practicability is yet undetermined, and time will probably record an adverse judgment against it in such cases. For diseases of the knee joint it affords a better operation, in my judgment, than disarticulation, which has lately been revived." The unfavorable results of the few cases of GRITTI'S amputation after shot injuries that the editor has been able to collect would seem to confirm the conclusions of Dr. WEIR. Dr. SALZMANN (*loc. cit.*, in *Archiv für Klin. Chir.*, Berlin, 1880, B. XXV, p. 658): "Taking into consideration, besides the high mortality, the disadvantages of a complicated operative technic, requiring a certain aptitude and at least 36 minutes time, the readily injured and for transport little adapted stump, liable to displacement of the patella, and bleeding from the popliteal artery; furthermore, the slow healing process with its uncertain results; we must come to the conclusion that neither on the field of battle nor in the field hospitals GRITTI'S operation seems to have any value as an operation in war surgery."

[3] VELPEAU (A.) (*Mémoire sur l'amputation de la jambe dans l'articulation du genou, et description d'un nouveau procédé pour pratiquer cette opération*, in *Archives Générales de Médecine*, 8me année, T. XXIV, 1830, p. 60) considers amputation at the knee preferable to amputation in the thigh as being less dangerous, easier performed, and furnishing a good stump for the use of a wooden leg. SMITH (STEPHEN) (*Cases in Surgery.—Amputation at the Knee Joint.* By W. PARKER, M. D., Professor of Surgery in the College of Physicians and Surgeons, New York. Reported by STEPHEN SMITH, in the *New York Journal of Medicine* for November, 1852, Vol. IX, p. 326) arrives at the following conclusions: "1. That amputation at the knee joint is a justifiable operation, as respects the nature of the structures engaged. 2. That it is a justifiable operation as respects the point of election. 3. That the stump formed by the articular surface of the lower extremity of the femur is as well adapted to the adjustment of an artificial limb, and to sustain and transmit the weight of the body, as when the operation is performed in the continuity of the thigh-bone." MARKOE (T. M.) (*Amputation at the Knee Joint, Illustrated by the Cases which have occurred in American practice, and mainly by those which have been treated in the New York Hospital*, in *New York Jour. of Med.*, New York, 1856, Vol. XVI, N. S., p. 35, etc.) presents eight points of comparison between this operation and the amputation in the thigh, all favoring knee joint amputation. SYME (JAMES) (*On Amputation at the Knee*, in *Edinburgh Medical Journal*, Edinburgh, 1866, Vol. XI, p. 874) concludes that the resulting stump is comfortable and serviceable. MARKOE (T. M.) (*Amputation at the Knee Joint*, in *New York Medical Journal*, 1868, Vol. VI, p. 509) sums up the cases of amputation in the thigh and at the knee joint performed from 1830–1864, in the New York Hospital, both showing a mortality of 54 per cent., and admits that as far as the percentage of fatality is concerned "this exhibit shows no advantage on the side of the knee joint operation," but claims a decided advantage for the usefulness of the knee joint stump. In this opinion he is corroborated by Dr. E. D. HUDSON, the ingenious deviser of various mechanical appliances for the relief of maimed soldiers; but the latter (*Mechanical Surgery.—Prothetic Appliances and Apparatus for Amputations. Resections, etc.*, New York, 1878, p. 24) deprecates the removal of the condyles as an operation neither "sustained by any rational hypothesis nor practised on any scientific principles. Except disease or injury of the condyles compel their excision, their thin anatomical and functional vestments should be kept inviolate from knife and saw. The condyles, their cartilage and vestment, as constituted, are nature's strongest, most tolerant and important supports in the entire body, and when these parts are amputated or disturbed, a valid, a positive reason should exist for so doing."

Section V.

WOUNDS AND OPERATIONS IN THE LEG.

The consideration of examples of simple and compound fractures, of burns, frost-bites, and other miscellaneous injuries of the leg will be reserved for Chapter XII, and as no cases of sabre or bayonet injuries of the tibia and fibula are recorded, it remains therefore only to examine the instances of shot injuries of this portion of the human structure. There are found on the registers one hundred and eighty-three shot contusions, and eight thousand nine hundred and eighty-eight shot fractures, making a total of nine thousand one hundred and seventy-one shot injuries of the bones of the leg. Four thousand one hundred and three were treated by conservation, and in five thousand and sixty-eight instances operative interference was resorted to, viz: excision in the bones of the leg or at the knee in three hundred and eighty-eight; amputation in the leg in three thousand seven hundred and thirty-six; amputation in the leg and subsequent exarticulation at the knee in three; amputation in the leg and subsequent amputation in the thigh in thirty-nine; exarticulation at the knee joint in one hundred and one; exarticulation at the knee and ablation in the thigh in seven; and amputation in the thigh in seven hundred and ninety-four instances. The exarticulations at the knee joint and the amputations in the thigh following shot fractures of bones of the leg have already been considered in the preceding sections of this Chapter, leaving the amputations in the leg to be examined in this Section.

SHOT CONTUSIONS OF THE BONES OF THE LEG.—One hundred and eighty-three examples of shot contusions of the bones of the leg are entered on the records. The injuries involved the tibia in one hundred and thirty-six, the fibula in twenty, the tibia and fibula in twelve instances, and in fifteen cases the precise seat of the injury was not specified. One hundred and sixty-five cases, of which fifteen resulted fatally, were treated throughout by expectation; in eight amputation in the leg was resorted to, unsuccessfully in four; one was followed by an unsuccessful amputation at the knee; and nine—three successful and six fatal—by amputation in the thigh.

Shot Contusions of the Bones of the Leg Treated by Conservation.—Of the one hundred and sixty-five cases of this group, fifteen, or 9.09 per cent., had fatal terminations. The right limb was injured in sixty-six, the left in seventy-eight, and in twenty-one cases the side was not indicated. Sequestra or exfoliations were removed in twenty-two instances. In one hundred and thirty-two of the one hundred and sixty-five cases the tibia was the seat of the injury, the lesion generally being on the inner anterior flat surface.

Recoveries after Shot Contusions of the Bones of the Leg treated by Conservation.—Generally the healing process was very slow, and not rarely attended by necrosis of the bone and tedious exfoliation, as in the following instances:

CASE 655.—Sergeant J. Meier, Co. H, 52d New York, aged 43 years, was wounded at Spottsylvania, May 12, 1864, by a musket ball, which entered the middle third of the right leg and injured the tibia. Surgeon D. H. Houston, 2d Delaware, reported that the wounded man was admitted to the field hospital of the 1st division, Second Corps, where the missile was extracted. Two weeks after the reception of the injury he was sent to Washington, and several days later to Philadelphia. Assistant Surgeon T. C. Brainerd, U. S. A., reported that "the patient entered Broad and Cherry Streets Hospital May 31st, the wound being healthy at date of admission and continuing so until July 3d, when sloughing set in. This was successfully treated by applications of nitric acid, followed by dressings of coal oil, together with internal administration of tincture of chloride of iron, porter, and generous diet. By July 12th, the wound was again granulating and his general health improving. Complete cicatrization being prevented by the presence of dead bone, that portion of the tibia was removed by Acting Assistant Surgeon D. W. Cadwallader, on October 1st, through an incision over the spine. The small fragments of bone were then thoroughly washed out with a syringe and the parts coaptated by adhesive plaster, over which simple water dressing was applied. Cicatrization progressed rapidly and was complete by October 28, 1864, when the patient was discharged from hospital," his term of service having expired three weeks previously. The removed sequestrum, six inches long, and contributed by the operator, is represented in the wood-cut (FIG. 255). Examining Surgeon G. J. Fisher, of Sing Sing, N. Y., August 22, 1865, certified to the injury, and stated: "The front of the injured leg is covered with delicate blue integument, not perfectly healed. He is unable to labor, and an artificial leg would be far preferable." The New York Examining Board reported, September 3, 1873: "There has been considerable loss of osseous substance. The entire anterior and inner aspect of the middle and upper portion of the leg is covered with encrustations, and there is periostitis and necrosis of bone at present." At subsequent examinations the same indurated, ulcerated, and partly indolent condition of the parts, interfering with locomotion, was reported. The pensioner was paid December 4, 1879.

FIG. 255.—Sequestrum from right tibia. *Spec.* 4193.

FIG. 256.—Exfoliation from right tibia. *Spec.* 2620.

CASE 656.—Corporal G. Ditch, Co. D, 82d Ohio, aged 21 years, received a shot wound of the right leg, with injury to the tibia, at Gettysburg, July 1, 1863. He was admitted to Satterlee Hospital, Philadelphia, eight days after the injury. Acting Assistant Surgeon M. Lampen contributed the pathological specimen, represented in the annexed cut (FIG. 256), with the following report: "The injury was caused by a round ball, which entered the leg anteriorly at the junction of the upper with the middle third of the tibia. On admission the wound was in a healthy condition. Hospital gangrene first appeared on July 23d, and spread rapidly for several days. Creasote mixture and yeast poultices were used to the wound and tonics internally, which treatment was continued for two weeks, when all signs of the disease had disappeared, a small portion of the tibia being left exposed. The patient's general health was good with the exception of an obstinate intermittent fever, which yielded but temporarily to quinine. On September 26th, a segment of bone about five inches long, one and a half inch in width at its widest part, and from one-eighth to one-fourth of an inch thick, was removed from the wound, the entire exfoliation of it having taken place in a few days from the time it was first observed. During the succeeding days several small spiculæ of bone were removed, after which exfoliation still progressed downwards, indicating that more bone would have to be removed." In October the patient was transferred to Seminary Hospital, Columbus, and lastly he was sent to Camp Dennison, where he was discharged March 30, 1864, and pensioned. Examining Surgeon R. L. Sweeney, of Marion, Ohio, describes the injury as follows: "A gunshot wound by a musket ball impinging on the leg just above the junction of the middle and upper thirds of the tibia. Contraction and adhesion of the muscles afterwards resulted from gangrene." The same Examiner reported, in 1870, that the wound had reopened and afterwards again closed imperfectly. On June 21, 1874, he stated that "the wound is still open and the bone diseased;" and in September, 1877, he reported a "large, adherent, and irritable cicatrix over the spine of the tibia, with malformation of the bone." The pensioner was paid December 4, 1879.

FIG. 257.—Appearance of limb fourteen months after injury. [From a photograph.]

CASE 657.—Corporal H. Rall, Co. D, 15th New York Heavy Artillery, aged 22 years, was wounded at the battle of Old Church, May 30, 1864. Surgeon L. W. Read, U. S. V., reported his entrance into the field hospital of the 3d division, Fifth Corps, with "shot wound of left leg." Surgeon B. B. Wilson, U. S. V., in charge of Stanton Hospital, Washington, contributed the pathological specimen (No. 4337 of the *Surgical Section*, A. M. M.), with the following history: "This young man was admitted to this hospital on June 4th. He had been wounded by a minié ball, which passed across the spine of the tibia about four inches from the head of the bone, bruising it and denuding it of periosteum along the track of the ball. He was somewhat debilitated when admitted, but being young and of good constitution, his general condition was not unfavorable. He was treated with applications of cold water and ice dressings to the wounded limb, and stimulating and supporting constitutional remedies. During the month of June and the beginning of July the limb was highly inflamed, and there was profuse suppuration and some sloughing in the vicinity of the wound; with considerable sympathy of the general system as manifested by chills, great debility, loss of appetite, and general febrile action. In the month of July, deep-seated fluctuation having been observed in the course of the shaft of the tibia, the pus was evacuated by free incisions in the direction of the length of the limb, with great relief to the patient. The periosteum was found to be extensively separated and the shaft of the bone necrosed. During the months of September, October, November, and December his condition gradually improved as the process of formation of the involucrum and the separation of the necrosed portion went on. A number of cloacæ formed in the line of the incisions for liberating pus, through which the necrosed bone could be felt gradually becoming detached from the living portion. The limb was, during this time, for the most part treated with emollient poultices. About the first of January the upper part of the shaft of the tibia could be distinguished at the position of the original wound, and about March 1st, upon seizing it with a forceps the whole dead mass could be moved within the sheath of the investing new bone. The operation for

the removal of necrosed bone was performed by Surgeon A. N. Dougherty, U. S. V., on March 14, 1865, by turning back the soft parts on each side from an incision through the centre of the cloacæ, and cutting away with the mallet and chisel sufficient of the new growth to permit the sequestrum to be lifted directly from its bed. It was found to consist of the entire shaft of the tibia from one epiphysis to the other, except small portions eroded by the absorbents. The after-treatment consisted of simple water dressings with slightly stimulating applications, and was unmarked with any noteworthy complication. On June 6, 1865, the patient was discharged on certificate of disability, being able to walk with ease and comfort, though the wound was not entirely healed. In July a photograph was taken, of which the adjoining wood-cut (FIG. 257) is a copy. He left the hospital in July and returned in the following month, asking to be employed under contract. Since that date he has been doing duty as chief nurse of one of the wards of this hospital, being in robust health, though his limb was not yet entirely healed." The specimen, consisting of a sequestrum nine inches long and eleven smaller pieces of necrosed bone, is shown somewhat reduced in FIG. 1 of PLATE LXXI, opposite page 428. Examiner T. F. Smith, of New York City, September 22, 1873, certified: "Shot fracture of left tibia, with union and great loss of bone substance, leaving a cicatrix over the anterior surface of the bone nine inches in length, red, unhealthy, and ulcerating," etc. The Brooklyn Examining Board reported, September 8, 1877: "We find an adherent, chronically inflamed cicatrix extending along the anterior face of the left tibia from below its head to within three inches of the ankle. There is tenderness on pressure. He requires the application of a bandage, and complains of pain in damp or cold weather. The usefulness of the limb is well nigh destroyed." The pensioner was paid March 4, 1880.

FIG. 258.—Slender sequestrum from left tibia. *Spec.* 420.

CASE 658.—Private W. Hargrave, Co. C, 142d New York, aged 25 years, was wounded at Chapin's Farm, September 29, 1864. Assistant Surgeon E. McClellan, U. S. A., reported his admission to hospital at Fort Monroe, October 4th, with "shot wound of right leg at middle third by a minié ball." On December 20th, the patient was permitted to leave for his home on furlough, and in June following he entered the Ira Harris Hospital, Albany, whence Assistant Surgeon J. H. Armsby, U. S. V., contributed the specimen, represented in the annexed cut (FIG. 258), with the following description: "The ball struck the tibia without fracturing it. The leg became inflamed and tender and a number of fistulous openings appeared. By exploring with the probe a large sequestrum was discovered on July 15th, when chloroform was administered and the necrosed bone was withdrawn with a forceps through a straight incision four inches long. After this operation the wound healed rapidly." The patient was mustered out of service July 17, 1865, but, owing to his becoming insane for a time, he did not apply for a pension until seven years afterwards. Examining Surgeon B. F. Sherman, of Ogdensburg, N. Y., October 9, 1872, certified to the injury, and added that "the skin is now closely attached to the bone, and the slightest abrasion produces a sore difficult to heal. There are now two small unhealed surfaces. The man states he suffers great pain in the leg at night after walking." In 1877, the wound was reported as healed. The pensioner was paid March 4, 1880.

CASE 659.—Private J. C. Coats, Co. I, 5th Vermont, aged 22 years, was wounded at Fredericksburg, December 13, 1862. He was conveyed to Harewood Hospital, Washington, and transferred to Satterlee, Philadelphia, December 23d. Acting Assistant Surgeon W. W. Keen, jr., from the latter hospital, described the wound as "an injury of the right tibia," and reported: "The man had been hit by a fragment of a shell, which struck his left shoe without seriously injuring the foot; it then glanced and struck the right tibia antero-internally in the lower third. On admission to the hospital there was a swelling, fluctuating but quite tense, at the point of the injury in the leg, which I opened by an incision about three-fourths of an inch long. About an ounce and a half of coagulated blood and some pus was evacuated, and poultices were ordered to be applied. The wound did well till January 1, 1863, when it began to enlarge and look very much like hospital gangrene. I suspected this the more from the prevalence of this disease at that time in the ward. The edges of the wound had become everted, its base rather ashy grey, and the discharge unhealthy, and a considerable circle of inflammation was around the opening. But the characteristic stinging pain being absent, I determined not to treat it as hospital gangrene but by the ordinary measures for inflammation. I ordered three compound cathartic pills to be taken and tincture of iodine to be applied locally, also a large poultice. On January 6th, the wound had increased to two and one-fourth inches in diameter, but was still entirely without the peculiar pain of hospital gangrene, when I ordered a mixture, consisting of half an ounce of hydrochloric acid, two ounces of laudanum, and one pint of water, to be used locally with lint. The acid wash was gradually diluted, and finally abandoned on January 25th. The patient being rather anæmic, I ordered two grains of quinine and four ounces of milk punch to be given daily. On January 30th another abscess was opened, and on February 9th yet another, each being preceded by severe pain, tenderness, and swelling. No doubt they as well as the original one were the result of severe local periostitis. They were readily subdued by cathartics and poultices, with morphia at night. No bone was at any time discharged, although considerable depression existed on the tibia from absorption of the tissue. On February 20th, the patient was transferred to Brattleboro', the wound having almost entirely healed and there being but little depression." The man entered the Marine Hospital at Burlington, and on March 8, 1864, was assigned to the Veteran Reserve Corps, and discharged July 13, 1865, and pensioned. Examining Surgeon A. P. Belden, of Whitehall, N. Y., reported the wound as being in an inflamed condition, and added that "it opens at any time the limb is much used in standing or walking. There is adhesion of the *peroneus longus* muscle and ligament, and inflammation produced partial anchylosis of the ankle joint." Examiner J. Lambert, of Salem, N. Y., August 10, 1878, reported that "the injured bone is necrosed for about three inches and demands an operation." The pensioner was paid September 4, 1880.

In the next instance copious hæmorrhage followed the injury, and the femoral artery was successfully ligated in Scarpa's triangle:

CASE 660.—Private T. Dassel, Co. G, 60th Indiana, aged 25 years, was severely wounded in the right leg, at Arkansas Post, January 11, 1863. He was placed on board of a hospital steamer several days after the reception of the injury and conveyed to St. Louis, where he entered Lawson Hospital, January 22d. Surgeon C. T. Alexander, U. S. A., in charge, reported: "The wound was located on the inner side of the upper third of the leg and the tibia was slightly injured. Hæmorrhage to the amount of eight ounces occurred from the anterior tibial artery on February 20th, on account of which the femoral artery

was ligated in Scarpa's triangle. Pyæmic infection also existed, which was successfully combated with the administration of quinine and brandy." The patient was discharged from service December 22, 1863, and pensioned. Examining Surgeon B. J. Day, of Evansville, Indiana, on April 25, 1864, certified to the anterior wound as "still discharging," and reported the same as "recently healed, in September, 1865, leaving a deep and adherent cicatrix." Examiner I. Casselberry subsequently certified: "The ball injured the tibia without fracturing it." At later examinations chronic inflammation of the bone and the impaired usefulness of the leg was described. The pensioner was paid March 4, 1880.

Fatal Cases of Shot Contusions of the Bones of the Leg treated by Conservation.—Fifteen of the one hundred and sixty-five cases of this group proved fatal:

CASE 661.—Private J. Buchfinck, Co. A, 16th Michigan, aged 26 years, was wounded at Poplar Grove Church, September 30, 1864, and admitted to the field hospital of the 1st division, Fifth Corps, with "severe wound of left leg, caused by a musket ball." A week later the man was transferred to Harewood Hospital, Washington, whence Surgeon R. B. Bontecou, U. S. V., contributed the specimen and reported the result of the case: "The leg was wounded in the lower third, the ball passing anterior to the tibia and injuring the periosteum. The patient, although weak, did tolerably well up to October 13th, at which time the parts became gangrenous, destroying the tissues from the ankle joint to the upper part of the middle third of the leg and leaving the tibia exposed for about six inches. Under the application of escharotics the wound became healthy and the limb improved until January 2, 1865, when gangrene reappeared and the tissues of the heel commenced sloughing, the exposed tibia being necrosed and exfoliating. In addition to escharotics the treatment was supporting throughout. The patient died of exhaustion January 26, 1865." The specimen (No. 3609, *Surgical Section*, A. M. M.) consists of the tibia, and shows one longitudinal half of the bone to be necrosed and nearly separated, the other portion being sheathed with callus.

CASE 662.—Corporal T. N. Chapin, Co. H, 21st Michigan, aged 35 years, was wounded at the battle of Stone River, January 1, 1863, and admitted to the field hospital of the 1st division, Fourteenth Corps, with "shot wound near the left ankle." Assistant Surgeon C. C. Gray, U. S. A., contributed the specimen (*Cat. Surg. Sect.*, 1866, p. 375, *Spec.* 1916), with the following history: "The ball entered at the inner side of the middle of the calf of the leg, passed obliquely downward under the bone, and came out a little above and posterior to the malleolus. The patient was admitted to hospital No. 8, Nashville, January 19th, his wound being erysipelatous, with great swelling of the entire leg. Gangrene invaded the limb so as to destroy the soft structures covering the tibia for nearly half way around the leg, and from within two inches of the insertion of the tendon of the patella to a point about three inches from the ankle joint. The bone was exposed and became badly necrosed. Chlorinated solution of soda in its full strength, and applied with picked lint, was used three times a day in the treatment, with general stimulants, bromine being used in the room as a general fumigant. The gangrene was arrested in about four weeks. The patient died June 1, 1863. Two weeks previous to his death granulations were feebly struggling to extend over the diseased bone, much of which was covered. The patient's general condition had become very low; his stomach refused almost everything, and the first symptoms of hydrothorax presented themselves. The autopsy disclosed the chest full of serum, also slight recent pleuritic adhesions." The specimen shows the diseased portion of the contused tibia encircled with a fringe of callus.

CASE 663.—Private N. Hollenbeck, Co. F, 7th New York Heavy Artillery, aged 37 years, was wounded at Tolopotomy Creek, May 30, 1864. He was admitted to Emory Hospital, Washington, June 8th, with "shot wound of left leg, over tibia." Acting Assistant Surgeon A. McLetchie contributed a specimen (*Cat. Surg. Sect.*, 1866, p. 519, *Spec.* 3133), with the following report: "The wound was caused by a minié ball, which entered the leg directly over the spine of the tibia, middle third, injuring the periosteum but not splintering the bone itself. The missile was extracted through the wound of entrance. The wounded man was admitted to Patterson Park Hospital, Baltimore, June 11th. He was in a very asthenic condition, and I ordered stimulants and good nourishing diet. About the 18th of June gangrene set in, manifesting itself by constitutional symptoms, fever, loss of appetite, etc., some days before the distinctive symptoms appeared in the wound. The disease was treated with nitric acid, cautery, dressings of chlorinate of soda, linseed poultices, charcoal, turpentine, and linseed oil, with frequent use of the syringe. On August 11th, he was returned from the gangrene ward with the wound much enlarged, but entirely free from gangrene, and nearly four inches of the bone exposed. Tincture of chloride of iron was administered daily, and milk punch, from the first appearance of the disease. Diarrhœa, which had been checked on his entrance into the hospital, now set in again, complicated with acute dysentery, and was treated with chalk mixture, vegetable astringents, and pulverized iron and opium. But the patient gradually wasted away from the steady strain on his system, and died August 26, 1864." The specimen is a wet preparation of the leg, showing a contusion in the middle third of the tibia, and necrosis extending up the shaft of the bone on its posterior surface to near its head, also two openings from ulceration in the lower third.

Shot Contusions of the Bones of the Leg followed by Amputations.—In eighteen instances the shot contusions of the bones of the leg were followed by amputation: eight in the leg, one at the knee joint, and nine in the thigh. The cases of amputation in the thigh and at the knee joint have already been cited in SECTIONS 2 and 3 of this CHAPTER.[1] The cases of amputation in the leg will be briefly reported:

[1] Amputations in the thigh for shot contusions of the bones of the leg: Corp'l S. B. Besley, H, 147th New York (TABLE XXXIX, No. 6, p. 313), secondary, middle third; recovery. Pt. C. C. Cannivan, G, 88th Pennsylvania (TABLE XL, No. 123, p. 321), secondary, lower third; fatal. Pt. C. P. Cobb, F, 1st Michigan (TABLE XXXIX, No. 113, p. 315), secondary, middle third; fatal. Serg't H. A. Colby, G, 2d U. S. S. S. (TABLE XL, No. 125, p. 321), secondary, lower third; fatal. Pt. J. C. Lemar, B, 97th Illinois (TABLE XXXIX, No. 136, p. 315), secondary, middle third; fatal. Serg't Z. H. Mather, M, 5th Michigan Cavalry (TABLE XXXVI, No. 476, p. 300), intermediary, lower third; fatal. Pt. J. Moran, I, 6th New York (TABLE XXXI, No. 979, p. 238), primary, middle third; fatal. Corp'l E. McGinley, I, 23d Wisconsin (TABLE XXXVI, No. 126, p. 295), intermediary, lower third; recovery. Corp'l S. H. Powell, C, 14th New Jersey (TABLE XL, No. 77, p. 321), secondary, lower third; recovery. Amputation at the knee joint for shot contusion of the tibia was performed in the case of Pt. W. W. Sandford, F, 103d Pennsylvania (TABLE LVI, No. 43, p. 407), intermediary; fatal.

CASE 664.—Sergeant R. T. Beatty, Co. H, 22d Pennsylvania Cavalry, aged 27 years, was wounded in the right leg, at Mount Vernon Forge, September 27, 1864, by a musket ball, which injured the tibia. He was discharged from service for disability, December 20, 1864, and pensioned. Extensive necrosis followed the injury, finally involving nearly the entire shaft of the tibia and rendering amputation necessary. The operation was performed, December 27, 1865, below the knee, by Pension Examining Surgeon C. A. Rahter, of Harrisburg, Penn., and resulted successfully. In his application for commutation, the pensioner described the stump as being in a fair condition.

CASE 665.—Private W. Bell, Co. I, 7th Michigan, aged 34 years, was wounded in both lower extremities and the head, at Antietam, September 17, 1862, one ball grazing the right tibia and fibula on their posterior surfaces just above the ankle joint. The patient became a great sufferer from extreme irritation of his nervous system and great irritability of the stomach. Repeated appearances of gangrene necessitated amputation, which was performed on November 3d, about one inch below the tubercle of the tibia, by Surgeon J. O. Bronson, U. S. V. Under the administration of vigorous tonics and strong stimulants, including narcotics, the patient gradually improved, and was able to start for his home December 5, 1862, when he received his discharge from service. He died March 30, 1874, of typhoid fever. A ligamentous preparation of the bones of the foot and the lower portion of the leg constitutes specimen 254 of the *Surgical Section* of the Museum, contributed by the operator.

CASE 666.—Private J. L. Hosford, Co. H, 4th Vermont, aged 21 years, was wounded at the Wilderness, May 5, 1864, by a musket ball, which entered the right leg, striking the tibia above the malleolus and lodging. He was admitted to Camden Street Hospital, Baltimore, where, on May 21st, an abscess was opened, through which the missile, together with several pieces of bone, were discharged. Considerable erysipelatous inflammation followed, attended with profuse and very fetid discharge, and the limb became exceedingly painful, necessitating its removal. The operation was performed by the skin-flap method, at the middle third, by Surgeon Z. E. Bliss, U. S. V., on May 31st. The patient recovered and was furnished with an artificial leg. He was discharged March 20, 1865, and pensioned.

CASE 667.—Private J. Esses, Co. K, 108th Ohio, aged 16 years, received a gunshot contusion of the right tibia, near Kenesaw Mountain, June 23, 1864. He entered hospital No. 2, Nashville, where flap amputation of the leg at the upper third was performed, by reason of gangrene, on July 26th, by Acting Assistant Surgeon J. A. Hall. The patient recovered, and was discharged May 22, 1865, and pensioned.

Four of the eight cases of amputation in the leg for shot contusions of the tibia or fibula had fatal terminations:

CASE 668.—Private J. Dicey, Co. F, 17th Michigan, received a flesh wound of the left thigh and a contused wound by a shell on the fore part of the middle of the right leg, at Antietam, September 17, 1862. He entered Casparis Hotel Hospital, Washington, October 13th, with the latter wound in a gangrenous condition and the tibia denuded of periosteum for four or five inches. The best antiseptic remedies failing to check the spreading of the disease, the limb was amputated on October 21st, by Acting Assistant Surgeon L. Heard, some five or six inches below the knee. The patient was very feeble and failed to rally. He died October 24, 1862. The amputated bones of the leg were contributed to the Museum by the operator, and constitute specimen 212 of the *Surgical Section*, A. M. M.

CASE 669.—Private G. Wilson, Co. B, 1st Ohio Artillery, aged 21 years, was wounded in the left leg, at Chickamauga, September 20, 1863. Acting Assistant Surgeon M. L. Herr, who amputated the injured limb at hospital No. 1, Nashville, contributed the specimen (FIG. 259), with the following history: "The injury was caused by a minié ball, which passed across the crest of the tibia at its middle third, merely cutting the tissues covering it and slightly injuring the bone. The man bandaged his wounded leg and remained with his regiment about a week, when the limb became very sore. He was then sent to hospital at Stevenson, Alabama, where he remained until he came here on October 14th. On examination I found the tibia denuded of periosteum for about four inches below the wound and for some distance above. The integuments were in a highly inflammatory condition, excessively painful, and suppurating freely, the pus being of a very offensive character. The patient was pale, though not much emaciated: his appetite good; bowels costive. Tincture of chloride of iron and whiskey were prescribed. The leg was bandaged from foot to knee so as to maintain equable pressure, and constant application of cold water was made. He continued to grow worse, the leg being very painful and the discharge very profuse, and on October 25th I found upon examination that the patient also had hypertrophy of the heart, from which he suffered considerably. On November 2d, I observed hectic or indication of irritative fever for the first time. His appetite was still good, and he complained of no pain except in the leg; but he was very weak and pale. Quinine, with morphia, was administered every three hours. On November 6th, the patient having expressed his wish of taking advantage of surgical interference, the limb was amputated at the upper third. Chloroform and sulphuric ether constituted the anæsthetic. No reaction took place, and the patient died the next morning. At the *post-mortem* examination four ounces of watery fluid were found in each pleural cavity, with slight pleuritic adhesions on the right side and small multiple abscesses through both lungs, the posterior portion of each being engorged. Some of the abscesses contained an inspissated matter or pus, not well broken up. The heart was very much enlarged and weighed seventeen and a half ounces; the pericardium contained two or three ounces of fluid, but the valves were not diseased. Four or five large abscesses were found on the anterior surface of the right lobe of the liver, which organ contained eight and a half ounces of pus." The specimen consists of the injured tibia, being thoroughly denuded of periosteum and necrosed in its greatest extent.

FIG. 259.—Portion of left tibia amputated for shot contusion. *Spec.* 1920.

CASE 670.—Corporal G. L. Stephens, Co. I, 30th Maine, was wounded at Cane River, April 23, 1864, by a musket ball, which entered the left leg, injuring the tibia but not fracturing it. One week after receiving the injury he was admitted to hospital at Baton Rouge, where the missile was extracted from the calf the leg on May 15th. By reason of erysipelatous inflammation of the foot and leg, attended with sloughing ulceration, circular amputation of the leg at the middle third was performed, on August 2d, by Surgeon D. W. Taylor, 34th Indiana. The patient died August 15, 1864, from exhaustion.

CASE 671.—Captain *F. L. Thompson*, Co. D, 36th Mississippi, aged 29 years, was wounded at Nashville, December 16, 1864, by a musket ball, which entered the right leg over the anterior aspect of the tibia, five inches above the ankle joint, passed downward, and lodged directly over the dorsum of the foot. Erysipelatous inflammation ensued; the ankle joint opened; tibia denuded of periosteum. On December 31st, the patient suffering from much pain and being apparently threatened with tetanus, the leg was amputated, by the circular method, at the junction of the upper and middle third, by Acting Assistant Surgeon C. H. Fisher. The patient was much emaciated, and died of exhaustion January 9, 1865.

SHOT FRACTURES OF THE BONES OF THE LEG.—Eight thousand nine hundred and eighty-eight cases of shot fractures of the bones of the leg are reported, and the results have been ascertained in all but two hundred and seventy-eight cases. The tibia was injured in two thousand five hundred and eighty-eight, the fibula in one thousand and thirty-three, the tibia and fibula in one thousand four hundred and fifty-one instances, and in three thousand nine hundred and sixteen cases the diagnosis failed to indicate the precise seat of the bony lesion.

TABLE LXI.

Numerical Statement of the Nature and Treatment of Eight Thousand Nine Hundred and Eighty-eight Shot Fractures of the Bones of the Leg.

TREATMENT.	CASES.					FRACTURES OF THE TIBIA.			FRACT. OF THE FIBULA.			FRACTURES OF THE TIBIA AND FIBULA.			BONE NOT SPECIFIED.

Three thousand nine hundred and thirty-eight, or less than one half of the cases, were treated by conservation, and five thousand and fifty, or 56.2 per cent., were followed by operation, viz: three hundred and forty by excision, forty-eight by excision and subsequent amputation, and four thousand six hundred and sixty-two by amputation either in the leg, at the knee, or in the thigh. It has already been stated on page 175, *ante*, that of the six thousand five hundred and seventy-six instances of shot fracture of the thigh bone, operative interference was resorted to in three thousand one hundred and nine, or 47.3 per cent., thus showing that the percentage of operations after shot fractures of the bones of the leg exceeded that after shot fractures of the femur by 8.9 per cent.

SHOT FRACTURES OF THE BONES OF THE LEG TREATED BY CONSERVATION.—The results as to fatality were ascertained in three thousand eight hundred and twenty-four of the three thousand nine hundred and thirty-eight shot fractures of one or both of the bones of the leg treated without operative interference, giving a mortal-

ity rate of 13.8 per cent. In seven hundred and eighty-six cases the seat of injury was not specified; in the remaining three thousand one hundred and fifty-two cases the tibia was implicated in nineteen hundred and seventy-two, the fibula in eight hundred and six, and both bones in three hundred and seventy-four instances, with death rates of 10.3, 7.8, and 20.3 per cent., respectively.

SHOT FRACTURES INVOLVING THE TIBIA TREATED BY CONSERVATION.—The tibia alone was involved in nineteen hundred and seventy-two instances, or in over one-half of the total number of cases of shot fractures of the leg treated conservatively. Of the nineteen hundred and thirty-eight instances in which the results were determined, two hundred and one proved fatal, a mortality of 10.3 per cent.

Recoveries after Shot Fractures of the Tibia treated by Conservation.—A few of the one thousand seven hundred and thirty-seven instances of this group will be detailed:

CASE 672.—Private J. Wells, Co. G, 71st Pennsylvania, aged 26 years, was wounded in the right leg, at Spottsylvania, May 12, 1864. He entered Columbian Hospital, Washington, and was subsequently transferred to Harewood Hospital. Surgeon R. B. Bontecou, U. S. V., in charge of the latter, contributed the photograph (*Card Photographs*, Vol. 3, p. 30, A. M. M.), and reported that the patient was discharged from service June 29, 1865, by reason of "shot comminuted fracture of the tibia at the middle third." Examiner C. C. Halsey, of Montrose, Penn., December 4, 1865, certified to the injury, and stated: "The wound at point of entrance is not sound and the skin for from two to three inches around it is a mass of scabs and sores. He complains of pain about the ankle and foot." The man drew pay as a full pensioner until September 4, 1866, after which time he ceased to communicate with the Pension Office for nearly thirteen years, when he reapplied and was restored, having in the meantime changed his residence to the State of Mississippi. Examiner T. G. Birchets, of Vicksburg, reported, February 16, 1880: "The wound is about the middle of the shaft of the tibia, resulting in a very large scar, and, from feeling, there has been loss of bone. His personal appearance is healthy. There is no disability." The pensioner was paid March 4, 1880, having his rate, in consequence of the last Examiner's report, reduced from total to one-fourth.

CASE 673.—Private W. Kelly, Co. C, 149th New York, aged 30 years, received a shot fracture of the left tibia by a minié ball, at Williamsport, July 11, 1863. He was admitted to Frederick, and subsequently passed through various hospitals, being ultimately discharged from service at Harewood, Washington, June 19, 1865. Surgeon R. B. Bontecou, U. S. V., in charge of the latter hospital, contributed the photograph represented in the annexed cut (FIG. 260), and reported that the patient's disability was total. Examiner G. W. Cook, of Syracuse, N. Y., February 25, 1867, certified to "shot wound of left leg at middle third, fracturing the tibia. A part of the bony substance was removed, leaving a large and extensive excavation, cicatrix, and deformity, with several minute fistulæ. Abscesses frequently form; the knee is stiff and the leg bad." Subsequent examiners report the same description of the injury and its results. The pensioner was paid March 4, 1880.

FIG. 260.—Shot fracture of left tibia. [From a photograph.]

CASE 674.—Private *S. Prillaman*, Co. G, 24th Virginia, aged 28 years, was wounded and captured at Williamsburg, May 5, 1862. He was admitted to Camden Street Hospital, Baltimore, nine days after the injury, whence Acting Assistant Surgeon E. G. Waters reported the following history: "A bullet entered the anterior and inner aspect of the left leg five inches above the ankle joint, fracturing the bone at that point through its continuity and comminuting the entire shaft for four inches upward, where a second solution of the continuity was produced. The missile on coming in contact with the bone separated into three portions, one passing inward, backward, and slightly upward, and emerging posteriorly through the calf of the leg; the second passed upward, backward, and outward, lodging under the integuments on the outer aspect of the leg; the third passed into the canal of the shaft, then upward, destroying the continuity of the bone and lodging some four inches above the point of entrance. The two last mentioned fragments were subsequently discovered and removed. When admitted the patient was much broken down in health, having little or no appetite and his complexion being sallow. The leg was much swollen and discharging profusely. It was placed at once in the anterior splint and emollient poultices were applied. Some days later the limb below the knee assumed a livid hue, giving rise to apprehensions of gangrene. This appearance, however, readily yielded to the free exhibition of quinine and stimulants, with cataplasms of bran and yeast applied locally, and the attempt to save the limb was persevered in. On June 24th, the patient was put under the influence of chloroform and the denuded fragments of bone were removed. The centre of the entire length of the fractured shaft was taken out, leaving only a thin scale on each side attached to healthy periosteum. It was hoped that nature would fill the cavity thus left and consolidate the limb. This expectation was fully answered in the sequel. During his stay in the hospital the patient suffered nine distinct attacks of erysipelas, several of them being of extraordinary severity, even for cases of gunshot fracture, the writer having had under his care nearly two hundred cases of the disease resulting from such causes and met with not more than two or three of equal violence. The first attack came on about July 1st, extending no higher than the knee, and yielding after five days treatment. On September 28th, the patient was suffering from the fifth attack, and several fistulous orifices were noticeable over the anterior aspect of the

leg, between the points of the fracture, through which the probe detected necrosed bone. It was then deemed expedient to remove several more detached fragments of bone, and with this view the fistulous orifices were dilated and a number of pieces were seized and withdrawn. Afterwards the leg became enormously swollen and the discharge grumous and offensive. The tissues around the knee joint also began to sympathize with the general disturbance and swelled to twice their natural size. About October 6th, fluctuation manifested itself over an extensive surface about the joint, when a bistoury was carefully introduced to the depth of an inch, giving exit to a quantity of sero-purulent fluid. The patient was actively plied with stimulants and tonics, the leg was maintained in the suspensory splint, and bran and yeast cataplasms were kept constantly applied, under which treatment the inflammation and swelling rapidly subsided, the discharge soon became healthy, and the patient's strength and spirit revived. He finally recovered with a strong and fine limb, an anchylosed knee joint, and a semi-flexed leg. On June 27, 1863, he left the hospital cured, to be sent south, having been for thirteen consecutive months under my care. All of the sinuses (of which there were many) had healed prior to his discharge except two, and these were satisfactorily ascertained not to communicate with dead bone but with aponeurotic expansions. Bony union had taken place to an ample extent, the entire canal of the shaft—which as above stated had been opened for the distance of four inches—being filled in its entire depth with new osseous tissue." This patient was heard from at his home in Franklin County, Virginia, in 1877, fifteen years after the injury, when his condition was described in a letter as that of a "bad cripple."

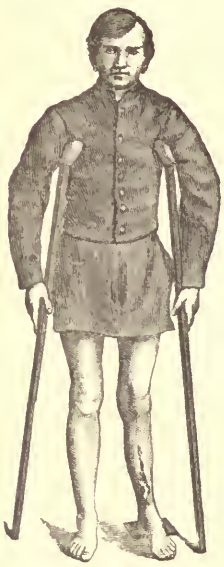

FIG. 261.—Shell fracture of lower third of left tibia. [From a photograph.]

CASE 675.—Private T. Schrup, Co. B, 10th New York Cavalry, aged 22 years, was wounded in the left leg, near the South Side Railroad, April 2, 1865. He was conveyed to the Depot Hospital at City Point two days after the injury, and transferred to Washington April 30th. Surgeon R. B. Bontecou, U. S. V., in charge of Harewood Hospital, contributed the photograph shown in the adjoining cut (FIG. 261), and described the injury as "a shell wound, severely fracturing the tibia, lower third. On admission the patient was in good health; condition of injured parts good, although severely lacerated. Treatment: Simple dressings, splints, and supporting diet. The parts healed kindly, and the patient was doing well when transferred to Lincoln Hospital, July 20, 1865." He was discharged from service, at the latter hospital, August 12, 1865, Surgeon J. C. McKee, U. S. A., certifying to "partial paralysis of the left foot and leg, resulting from the wound." Immediately after being discharged the patient made an application for pension, and was examined by M. D. Benedict, Pension Examining Surgeon, who described the fractured bone as "united with slight shortening and some deformity," and the limb as useless for the time being. The man has not been heard from since filing his application.

CASE 676.—Sergeant J. R. Rice, Co. K, 1st Vermont Cavalry, aged 30 years, was wounded in a cavalry charge between Hagerstown and Williamsport, July 6, 1863, by a minié ball, which entered the outer aspect of the lower portion of the right leg, fracturing the tibia and lodging in the bone. Two days after the injury he was admitted to hospital at Frederick, whence Acting Assistant Surgeon W. S. Adams reported as follows: "The patient was admitted under care of Acting Assistant Surgeon W. P. Morgan, who removed a few fragments and placed the limb in Smith's anterior splint. His general condition was good. On July 22d the patient came under my care, when I found that he had considerable irritative fever; tongue disposed to be dry; slight diarrhœa and but little appetite; limb painful and œdematous. I took off the splint to examine the limb and removed several fragments of bone and the missile, which was found embedded in the medullary cavity about two inches below the point of the injury. Stimulants, with tonics and good diet, were ordered. By August 1st, the appearance of the limb had much improved, the patient having experienced but little pain since the removal of the ball; appetite and general condition improving. On August 14th, his countenance had assumed a sallow appearance, and he had a slight headache, accompanied by constipation of bowels, for which three compound rhubarb pills were administered. Three days later there was well-marked jaundice, when pills of blue mass and compound extract of colocynth were prescribed. By August 21st, the jaundice was disappearing; condition of leg good. On September 1st, union of bone seemed quite firm; wound yet discharging quite freely. The limb now was allowed to rest on pillows during the day time and suspended in splints at nights. On September 20th, the splint was removed from the leg, union being firm, with no evidence of necrosis, and the wound healing kindly. About October 1st, the patient was going around on crutches, and two weeks later he laid these aside and walked with a cane, the wound having all closed with the exception of an opening barely large enough to admit a probe, On February 1, 1864, the patient was furloughed, having been able for a considerable time to walk without the aid of a cane and the wound being healed." He was subsequently promoted to Lieutenant, and ultimately mustered out of service June 21, 1865. In 1876, when applying for pension, he was examined by Surgeon C. B. Currier, of Middlebury, Vermont, who reported that "from loss of bone there is a depression as large as a twenty-dollar piece and about one-eighth of an inch deep; cicatrix tender to the touch; œdema of leg and foot; leg one and a half inch shorter than the other; muscles of leg flabby and evidently weak. He cannot stand or walk much; health good." The pensioner was paid September 4, 1880.

CASE 677.—Captain W. W. Ellis, Co. D, 61st Pennsylvania, aged 23 years, was wounded in the left leg, at Chancellorsville, May 3, 1863, and entered Douglas Hospital, Washington, five days afterwards. Assistant Surgeon W. Thomson, U. S. A., reported: "This officer suffered a fracture of the tibia near its middle by a ball, which entered posteriorly at the gastrocnemius muscle, and was retained. The fracture united without exfoliation, necrosis, or even free suppuration. The leg was placed in a bran box and dressed with cold-water applications. The patient suffered from severe catarrh, which yielded to treatment. There was also hyperæsthesia of the foot, for which, before the patient left on furlough in June, I made an incision in search of the ball and disturbed the cicatrix with good effect, relieving the nervous irritation of the foot. When the patient returned from furlough, September 1st, he was ordered to report to Surgeon M. Clymer, U. S. V., for treatment, and I lost sight of him. His recovery was good, but the leg was yet feeble and contracted, owing to want of passive motion while at his home." Captain Ellis resigned January 1, 1864, and was commissioned in the Veteran Reserve Corps, in which organization he served until

UNIVERSITY
OF CALIFORNIA

March 13, 1866, when he was mustered out and pensioned. Examining Surgeon G. Urquhart, of Wilkesbarre, Pennsylvania, August 22, 1866, certified to half an inch shortening of the limb; also to painfulness, weakness, and occasional lameness. Examiner J. W. Martin, of Red Oak, Iowa, reported, September 4, 1873: "There are large cicatrices on the left side of the tibia; leg bent and shortened; foot swollen and tender, and muscles shrunken above the ankle. He suffers extreme pain in the leg and is unable to bear much weight upon it; general health not good." The pensioner was paid September 4, 1880.

CASE 678.—Private J. Walker, Co. A, 7th Wisconsin, aged 27 years, was wounded at the Wilderness, May 6, 1864. Surgeon C. N. Chamberlain, U. S. V., reported his admission to the field hospital of the 4th division, Fifth Corps, with "shot fracture of left leg, caused by a minié ball." On May 12th, the wounded man entered Armory Square Hospital, Washington, where his injured leg was operated on by Surgeon D. W. Bliss, U. S. V., who made the following report of the case: "The ball was found embedded in the shaft of the tibia at about its middle, whence it was extracted on August 13th. The leg went through all the symptoms of necrosis of one or both the bones, the first signs of which appeared on August 19th. On October 10th, the patient was placed upon the operating table and four inches of the shaft of the tibia was removed, together with all the necrosed spicula of bone. Chloroform was used as the anæsthetic. Simple dressings, stimulants, and nourishing diet constituted the treatment. The patient did well after the operation." He was discharged from service January 24, 1865, and pensioned. Examiner A. McBean, of Chippewa Falls, Wisconsin, certified, July 9, 1867: "The remaining portion of the bone from the ankle joint to within four inches of its head has become carious. A large open ulcer is the consequence." Examiner F. A. Reckard reported, March 4, 1874: "The wound is yet open and discharging from an orifice some four inches in length. The remainder of the tibia is badly diseased and portions have come away at different times. The limb is very much swollen at times and retains him in bed for months." The pensioner was paid March 4, 1880. The bone removed consists of a sequestrum six inches in length, and for four inches is tubular. It was contributed to the Museum by the operator, and is numbered specimen 3283 of the *Surgical Section*. The specimen is shown in FIGURE 2 of PLATE LXXI, opposite page 428.

CASE 679.—Private A. Elmer, Co. I, 69th Pennsylvania, aged 21 years, was wounded at Petersburg, June 18, 1864, and admitted to the field hospital of the 2d division, Second Corps. Surgeon J. F. Dyer, 19th Massachusetts, reported: "Shot fracture of left leg by minié ball; anterior tibial artery divided. Ligation performed by Surgeon N. Hayward, 20th Massachusetts." Surgeon B. B. Wilson, U. S. V., reported that the wounded man was admitted to Stanton Hospital, Washington, July 1st, with "shot fracture of left tibia, lower third," for which splints and simple dressings were used, and that he was furloughed January 4, 1865. The patient was subsequently transferred to Satterlee Hospital, Philadelphia, whence he was discharged July 7, 1865, by reason of "lameness resulting from the injury," and pensioned. Examiner A. D. Newell, of New Brunswick, N. J., March 5, 1878, certified to the wound and fracture, and stated: "The bone is not sound now. The wounded leg is smaller. The tendo-achillis has contracted so that in walking his toes strike the ground—is quite lame." The pensioner was paid December 4, 1879.

In the following instance a portion of the missile remained lodged in the tibia, keeping the wound open until the time of the officer's death, twelve years after the injury:

CASE 680.—Colonel W. F. Lynch, 58th Illinois, aged 25 years, was wounded at Yellow Bayou, May 18, 1864. Surgeon G. L. Lucas, 47th Illinois, reported his admission to the field hospital of the 1st division, Sixteenth Corps, with "a bullet fracture in right leg; missile extracted by Surgeon J. E. Murta, 8th Wisconsin." From the field hospital the patient proceeded to his home, and, on February 7, 1865, he was mustered out by expiration of service. His condition at this time was described by Surgeon B. Norris, U. S. A., as follows: "The wound is a very remarkable one of the tibia, about two inches from the knee joint, being a perforation of the bone to the depth of more than an inch, and open as an augur hole. A fetid discharge escapes through the opening, and the soft tissues around it are inflamed over a circle of more than two inches in diameter. These signs indicate disease which can only be entirely removed by amputation of the leg. I further certify that in consequence of this wound his nervous system has become morbidly excitable and his health so much impaired as to unfit him for any regimental duty." About a year after his muster out of service Colonel Lynch received a commission as an officer of the Regular Army, and, on December 15, 1870, he was finally placed on the retired list with the rank of Brigadier General. Acting Assistant Surgeon F. H. Atkins reported that this officer died, from the ultimate effects of his wound, on December 29, 1876, at Fort Larned, Kansas, and contributed the pathological specimen numbered 6734 of the *Surgical Section*, and represented in PLATE LXXIV, opposite p. 434, with the following information in regard to the case: "A portion of lead was cut out on the inner aspect of the limb a long time after the injury, while another portion remained lodged in the bone. The wound of exit healed early, both the soft and osseous tissues; but the anterior wound remained open up to the time of his death, small pieces of dead bone being occasionally removed, and a profuse and extremely offensive discharge continuing. All efforts on the part of many able surgeons to induce the patient to submit to the removal of the dead or diseased interior of the tibia were futile until within three months of his death, when he desired an operation, which I refused in view of his previous disease and present prostration, a position concurred in by Assistant Surgeon W. S. Tremaine, U. S. A., who saw him during consultation on December 11, 1876. Meanwhile, in the winter of 1875–6, he had a serious illness, apparently of pyæmic character. About July 1, 1876, a severe pneumonia, followed by diarrhœa, nearly proved fatal, and after that there was constant diarrhœa and almost complete interruption of the digestive functions. From October until his death the apparently tuberculous disease in his left lung progressed rapidly, a large cavity forming. His death seemed to result from inanition. No general autopsy was permitted, though the upper half of the tibia was allowed to be removed. The bone was ripped by a saw longitudinally, the incision running obliquely backward and inward to avoid cutting the wound of entrance. A condition of the bone was displayed which, in my opinion, would have given prompt and absolutely favorable results had excision of the diseased portion been performed at any time prior to the winter of 1875–6. A cavity averaging one and one-fourth inch in diameter, and located most favorably for removing the dead bone successfully, was found directly behind the wound of entrance. The cavity was lined throughout by a membrane continuous with the edges of the soft tissues and the skin. The dead bone approached the surface of the tibia rarely as near as one-third of an inch, and the knee joint about one inch, extending only one-half to three-fourths of an inch below the wound of entrance. At the lowest part of the cavity, on the posterior segment, there was a group of black masses, white internally. A

minute portion of this substance, treated with carbonate of soda on charcoal under the blowpipe, gave numerous metallic globules, malleable under pressure, showing that the mass was part of the missile—now carbonate of lead within and sulphuret without. The upper third of the tibia was greatly hypertrophied."

Fatal Cases of Shot Fractures of the Tibia, treated by Conservation.—Two hundred and one cases of this group were reported, the fatal issue being generally ascribed to pyæmia, gangrene, or exhaustion:

CASE 681.—Private I. D. Mason, Co. D, 17th Maine, aged 30 years, was wounded at the Wilderness, May 5, 1864, by a musket ball, which entered the external aspect of the left leg, fracturing the tibia immediately below its head, passed into the right leg about two inches lower down, fracturing the right tibia also, and lodging. The wounded man was treated at Fredericksburg until May 25th, when he was admitted into Douglas Hospital, Washington, in a typhoid state. Death took place from exhaustion May 31, 1864. The upper halves of the bones of both legs are represented in the adjacent cuts (FIGS. 262, 263), exhibiting each tibia to be shattered in the upper third, and showing incipient necrosis as the only observable change. The history and the specimens were contributed by Assistant Surgeon W. Thomson, U. S. A.

FIG. 262.—Shot fracture of upper third of left tibia. *Spec.* 3549.

FIG. 263.—Shot fracture of right tibia. *Spec.* 3549.

CASE 682.—Corporal *W. Smith*, Co. K, 1st Louisiana, aged 18 years, was wounded at Gettysburg, July 2, 1863, by a musket ball, which fractured the left tibia at the lower third. On July 27th, he was admitted to Camp Letterman, the leg being considerably swollen and painful. Acting Assistant Surgeon P. S. Leisenring reported that the limb was placed in a fracture box and solution of lead and opium applied. On August 6th, the use of flaxseed poultices was commenced, and an abscess opened posterior to the wound. After this there was some improvement. On August 18th, the fracture-box was removed, and four days later the patient was able to move his limb. The administration of febrifuge remedies, including quinine, was subsequently prescribed, the patient having a severe chill on August 25th. Another abscess, forming anterior to the tibia, was lanced several days afterwards, after which there was improvement for some days. On September 14th, the patient came under the care of Assistant Surgeon R. G. Southall, C. S. A., who found him very much emaciated and with several ulcers on the leg. The patient was also troubled with diarrhœa and had lost his appetite. Under the administration of tonics, stimulants, and astringents, and the application of stimulating lotions and nitrate of silver, the patient slowly mended until September 22d, when the ulcers assumed a phagedenic form and the improvement ceased. On September 28th, two spiculæ of considerable size were removed from the tibia. Acting Assistant Surgeon W. M. Welch reported the termination of the case as follows: "The case came under my charge on October 13th. The bone had united, but the leg presented two ulcers near the region of the wound, which had sloughed largely. Nitric acid applications were resorted to, under which treatment the leg improved until October 24th, when the ulcers again became phagedenic and nitric acid was again resorted to. Bromine was also used, but neither remedy produced any salutary effect, the patient's system lacking sufficient vitality to separate the sloughs from the living tissues. The patient also continued to be a sufferer from obstinate diarrhœa, which baffled all treatment. He died from exhaustion November 3, 1863. On examination, the fractured portion of the tibia was found to be very feebly united; callus insufficient in quantity and unhealthy in quality. The proximate portion of the fibula was also diseased." The lower third of the bones of the wounded leg, represented in the cut (FIG. 264), were contributed to the Museum by Acting Assistant Surgeon E. P. Townsend. The specimen, to which a sequestrum remains attached, shows the fractured shaft of the tibia to have been invaded by caries to a considerable degree and a large portion of it lost by suppuration.

FIG. 264.—Shot fracture of lower third of left tibia. *Spec.* 1936.

CASE 683.—Private *J. Guy*, Co. D, 39th North Carolina, aged 19 years, was wounded in the left leg, at Stone River, December 31, 1862. Surgeon C. W. Horner, U. S. V., reported: "The injury was caused by a conical ball, which passed from the inner to the outer aspect of the middle third of the leg, producing a comminuted fracture of the tibia and carrying away one and a half inch of its shaft. The man was captured soon after the reception of the wound and carried to hospital at Murfreesboro', where he remained until August 1, 1863, when he was sent to the Prison Hospital. According to his statement no splints had been applied to the limb. On January 4, 1864, the patient was admitted to Hospital No. 1, at Nashville, at which time he was very much reduced, even to emaciation, numerous and large abscesses having formed about the leg and particles of bone being brought away with the discharge from the wound. The upper fragment of the tibia was displaced outward and forward, and an interval of about an inch existed between it and the lower fragment. The head of the fibula, too, was displaced upward and outward, and the slightest motion of the limb produced excessive pain. The patient had no appetite; stomach irritable; pulse quick and weak. Erysipelas also supervened, and severe cough and diarrhœa. The former was checked and the wound healed; but the cough and diarrhœa continued troublesome and persistent. The pulmonic trouble became more aggravated, and the patient died February 15, 1864." The bones of the injured leg, represented in the annexed cut (FIG. 265), were forwarded to the Museum by Acting Assistant Surgeon R. T. Higgins, and a cast of the limb, taken some weeks prior to the patient's decease, and contributed by Ass't Surgeon C. J. Kipp, U. S. V., constitutes specimen 6683 of the *Surgical Section*.

FIG. 265.—Portions of the bones of the left leg, with shot fracture of tibia at junction of middle and upper thirds. *Spec.* 2184.

SHOT FRACTURES OF THE FIBULA TREATED BY CONSERVATION.—The results of the injuries were ascertained in seven hundred and ninety-nine of the eight hundred and six cases of this group. Seven hundred and twenty-one recovered and seventy-eight died, a mortality of 9.7 per cent.

Examples of Recovery after Shot Fractures of the Fibula treated by Conservation.—These injuries healed without serious complications; but it would appear from the records of the Pension Office that the movements of the ankle joint frequently remained impaired:

CASE 684.—Private A. McPhee, Co. B, 16th New York, aged 20 years, was wounded in the left leg, at Gaines's Mill, June 27, 1862. He was conveyed to hospital at Fort Monroe, and several days afterwards to Philadelphia. Assistant Surgeon C. W. Horner, U. S. V., in charge of Wood Street Hospital, reported: "He was wounded by a minié ball, which entered the leg on its outside at the middle, fractured the fibula extensively, and passing downward made its way to the inside of the limb below the ankle, where it was retained, and whence it was removed at the Pennsylvania Hospital about the 10th of July. He was transferred to this hospital October 6th. His treatment consists of bandaging, occasional poultices, and cerate dressing. The patient is progressing favorably." He was discharged January 19, 1863, and pensioned. Examining Surgeon J. Cummiskey, of Philadelphia, February 6, 1863, certified to "elevation of the heel and stiffness of the ankle joint resulting from the wound. He is very lame, and obliged to carry a cane in walking." Examiner E. H. Lewis, of Carver, Minnesota, reported, August 5, 1874: "At present the lower or articulating portion of the fibula is in a process of acute caries; ankle joint anchylosed, pus discharging from six sinuses," etc. The St. Paul Examining Board reported, several years afterwards, that "the wound continually opens and discharges, small pieces of bone escaping. Cicatrix large and weak; motion of ankle much impaired. The greater toe is doubled under and the tendo-achillis hampered by the wound." The pensioner was paid March 4, 1880.

CASE 685.—Corporal C. A. Woodruff, Co. A, 10th Vermont, aged 19 years, was wounded through the right leg, at Cold Harbor, June 3, 1864. He was admitted to Mount Pleasant Hospital, Washington, four days after the injury, and subsequently to Brattleboro'. On December 27th, the patient was transferred to Sloan Hospital, Montpelier, whence Surgeon H. Janes, U. S. V., contributed the photograph (FIG. 266), with the following history: "The wound was caused by a musket ball, which entered about the middle of the leg, on the outer and posterior aspect, passed forward and emerged anteriorly between the tibia and fibula, two inches below the point of entrance, fracturing the fibula. Several pieces of bone were removed at the time of the injury. Gangrene followed, and the wound opened to the size of an open hand. The wound of entrance closed in April, 1865, but that of exit had not healed at the time of his discharge from service. He was then obliged to use a crutch in walking. The patient also had a congenital malposition of the heart, which he never discovered until the time of his enlistment, the location of it being on the right side, with the apex beating under the right nipple. His chest was well formed, and he was a stout and, excepting his wound, a healthy man." The patient was discharged from service August 18, 1865, and pensioned. Examiner G. B. Bullard, of St. Johnsbury, Vermont, certified, on January 25, 1866, that particles of bone were still being discharged from the wound, and the pensioner complained of stiffness of the ankle joint, and that he was unable to bear his weight on his right foot or walk without crutches. He was last paid September 4, 1866, since when he has not been heard from.

FIG. 266.—Shot fracture of right fibula. [From a photograph.]

Fatal Cases of Shot Fractures of the Fibula treated by Conservation.—Seventy-eight cases are recorded in this group. The fatal issue was frequently due to complications, as in the following instance, in which the patient died with the ordinary symptoms of typhoid fever eight days after the reception of the injury:

CASE 686.—Sergeant D. P. Spicer, 1st Iowa Battery, was wounded in the right leg, at Resaca, May 15, 1864, and admitted to the field hospital of the 4th division, Fifteenth Corps. Dr. J. M. Woodworth, Surgeon 1st Illinois Light Artillery, and Medical Inspector, contributed the following report: "A gunshot wound just below the knee joint, fracturing the head of the fibula and passing out at the centre of the lower border of the popliteal space. The artery was not wounded. The subject was a large, healthy, muscular man, about 30 years old. After his admission to hospital the fragments of bone were removed, the wound was cleansed and cold-water dressing applied. The wound looked well until the morning of the 18th, when it presented a red inflamed margin, with tumefaction of the surrounding soft parts and enlargement of the veins of the thigh. A thin sanious discharge exuded from the opening, and the entire limb as far as the swelling extended was remarkably hot; pulse full and strong. The patient was separated from the rest of the wounded, and his treatment was the same as in similar cases. On May 20th, the wounded limb was tensely swollen from the ankle to the body. At first the surface of the inflamed part was florid, but it became yellowish and mottled with greenish-purple gangrenous blotches. It was completely blistered with the stronger preparation of iodine, and kept imbued with a mixture of tincture of chloride of iron, creasote, and tincture of iodine in alcohol. The patient was also kept on a full course of tonics, stimulants, and generous diet. The disease or erysipelatous inflammation did not extend further, but the pulse grew more and more feeble. The patient became incoherent in mind and sank steadily, expiring on May 23, 1864. He died with the ordinary symptoms of the more grave form of typhoid fever."

SHOT FRACTURES INVOLVING BOTH BONES OF THE LEG TREATED BY CONSERVATION.—The shot fractures involving both bones of the leg, while far less numerous than those of the tibia or of the fibula, largely exceeded them in fatality, seventy-five of the three hundred and seventy determined cases having resulted in death, a mortality of 20.2 per cent.

Examples of Recovery after Shot Fractures involving both Bones of the Leg treated by Conservation.—There were two hundred and ninety-five instances belonging to this group. In nearly all the cases there was more or less shortening of the limb, and in some instances considerable deformity, especially convexity, but many of the patients recovered with useful limbs:

CASE 687.—Private B. F. Hayner, Co. H, 125th New York, aged 19 years, was wounded at Gettysburg, July 3, 1863. He remained at the Second Corps Hospital for one month, when he was transferred to Camp Letterman. Acting Assistant Surgeon W. B. Jones reported: "Compound fracture of right and left tibia, lower third, by a piece of shell, which struck the outer side of the left leg, passed transversely, and grazed the anterior aspect of the right leg. Cold-water and simple cerate dressings were used; splints, etc. Union took place in both legs, and by September 10th the patient was cured, but still unable to walk." He was transferred to McKim's Mansion Hospital, Baltimore, October 23d, and subsequently to Camden Street. Surgeon Z. E. Bliss, U. S. V., in charge of the latter, corroborated the description of the injury, and reported that the fracture box was used in the treatment of both legs; also that in April, 1864, the wound of the right leg had closed, while that of the left leg was still unhealed, there being slight lateral curvature in both legs; the patient able to walk well with the aid of a cane. The patient subsequently passed through different hospitals, and on August 27, 1864, he was returned to his command in the field. Being found entirely unfit for duty, he was returned to hospital for treatment until June 5, 1865, when he was mustered out of service and pensioned. Examining Surgeon R. B. Bontecou, of Troy, N. Y., reported April 7, 1875, that "the tibia and fibula were both broken in the right leg, and have united, with some deformity, leaving a useful limb. The left leg has united with an outwardly curved deformity, and there remains some carious bone in the tibia, with a fistulous opening and constant discharge, considerable tumefaction and inflammation in the vicinity of the wound. There is considerable loss of soft parts, leaving a long cicatrix, and the limb is lame in consequence of the injury." Substantially the same was reported at subsequent examinations. The pensioner was paid December 4, 1879.

CASE 688.—Private M. Lynn, Co. I, 26th Pennsylvania, aged 26 years, was wounded at Chancellorsville, May 3, 1863. He was admitted to the field hospital of the 2d division, Third Corps, where Assistant Surgeon E. Marshall, 124th New York, recorded "shot fracture of left leg." Surgeon J. A. Lidell, U. S. V., reported as follows: "The patient entered Stanton Hospital, Washington, June 15th, with compound fracture of tibia and fibula at the middle third, caused by a minié ball entering at the posterior and inner side of the calf of the leg and escaping in front. At the time of his admission the leg was in a fracture box; the wound suppurated freely; patient's general condition good. Previous to his entrance to this hospital several detached fragments of bone had been removed, and a portion of the bullet had also been extracted; subsequently about half a dozen more fragments of bone were removed at different times. Splints and water dressings were used. About July 1st, the fracture had united, and one month later there was firm union of the bones and the wound was healing rapidly. On September 22d, the patient received a furlough and was allowed to go to his home for two months. The orifice of entrance healed about the 1st of October, and before the patient was transferred to Philadelphia, in April, 1864, the orifice of exit had also closed. The atrophy of the wounded limb had disappeared entirely and the muscles of the leg acted freely, the patient being able to walk well without the aid of a cane and without limping. There was no shortening, and no deformity aside from some loss of osseous tissue at the seat of the fracture. The patient stated that the wounded limb had not caused him to feel sick at any time. He made the best recovery of any case of shot fracture of the leg that has come under my observation." After his transfer the patient was admitted to McClellan Hospital, whence he was returned to duty May 31st, to be discharged. He was mustered out of service June 18, 1864, and pensioned. The Philadelphia Examining Board at different dates certified to the injury, and reported that an adherent cicatrix resulted, causing impaired use of the limb; also that the fractured space had filled with cartilaginous tissue. The pensioner has been exempted from further examinations since 1873. He was paid December 4, 1879.

In the following cases a longitudinal incision was made along the crest of the tibia, and a number of pieces of both the tibia and fibula were removed:

CASE 689.—Private S. McNitt, Co. D, 4th Delaware, aged 23 years, was accidentally shot in the left leg, while in camp near Fairfax Court House, October 22, 1863. Surgeon D. S. Hopkins, 4th Delaware, reported: "The ball entered the limb posteriorly, at the junction of the upper with the middle third, passed directly through, causing a compound comminuted fracture of the tibia and fibula, and came out anteriorly, carrying with it fragments of bone. Comparatively slight hæmorrhage ensued, and that principally of a venous character. An examination showed that although extensive laceration of the soft parts had taken place, yet the arteries were found entire and pulsation at the extremities very perceptible. The leg was, therefore, placed in a horizontal position and loose spiculæ of bone were removed. Cold-water dressings were applied, and the patient was made as comfortable as circumstances would permit. Solution of morphia, two grains to an ounce of water, was administered at intervals of an hour until the patient became quiet. Next morning, October 23d, his system seemed to have suffered but little from the shock, he being comparatively comfortable. More minute examination revealed the fact that a number of pieces of bone still remained in the wound, which it was deemed necessary to remove. Accordingly a longitudinal incision was made along the crest of the tibia, the patient being under the influence of chloroform, and several spiculæ of bone were taken out varying in length from one to two and a half inches. The largest, from the crest of the tibia, included in its thickness much

of the cancellated structure of the bone, as was the case with each piece removed; the average breadth was three-fourths of an inch. After the fragments had been removed the parts were coaptated, the limb was adjusted in a fracture-box, and cold-water dressings were reapplied. The patient was comparatively comfortable during the night." Some months after the reception of the injury the patient was admitted from the field into hospital at Alexandria, and lastly he was transferred to Tilton Hospital, Wilmington, where he was discharged June 19, 1865, Surgeon E. I. Baily, U. S. A., certifying to the shot fracture resulting in "necrosis and shortening of the leg." The Wilmington Examining Board, in describing the injury, December 6, 1871, reported: "Large and irregular cicatrices in front and rear of the limb; unnatural condition of skin; shortening of leg by an inch and a half. On account of occasional suppuration and exfoliation the limb has become much weakened and the convexity of it more marked. The disability is permanent in its present degree." After another inspection two years later the pensioner was exempted from further examinations. He was paid September 4, 1880.

In the next case a sequestrum nine inches and a half in length was removed. New bone of sufficient thickness had formed to hold the limb in its normal position. The patient died, nine years after the reception of the injury, of dropsy:

CASE 690.—Lieutenant C. G. Martyn, Co. A, 2d New York Heavy Artillery, aged 29 years, was wounded at Deep Bottom, August 14, 1864, and entered Armory Square Hospital, Washington, three days afterwards. Assistant Surgeon C. A. Leale, U. S. V., contributed the pathological specimen (FIG. 267), and the following history of the case: "He was wounded by a minié ball, which entered the right leg between the tibialis anticus and extensor longus digitorum muscles, opposite the centre of the middle third of the tibia, passed through the leg transversely, fracturing the tibia and fibula, and made its exit at the anterior lateral aspect of the soleus muscle. Immediately after the reception of the injury the patient was removed to a field hospital, and on the following day he was placed under the influence of chloroform, when several spiculæ of bone were removed. Splints were then applied, and he was transferred to Washington, where the wound was dressed and the limb placed in a fracture-box. The general condition of the patient at that time was good. On account of great pain the fracture-box was removed on October 7th, and Smith's anterior splint was adjusted, which allowed the patient to rest more comfortably. On November 1st the splints were removed, and the limb was laid on a pillow and dressed twice a day with simple dressings. The wound had now nearly closed, but several sinuses existed and communicated with the bone, and the fracture had not yet united. By March 16, 1865, the patient was able to leave his bed and walk on crutches. He first came under my charge on April 1st, when, on an examination with the probe, I found the sinuses to communicate with dead bone; the discharge of pus was about three ounces per diem; appetite and general condition good. The discharge continuing to increase and the patient gradually growing weaker, he was placed under the influence of ether on April 25th, and an incision was made nine inches in length over the anterior portion of the tibia, when it was found that necrosis extended to within two inches of the ankle joint and nearly to the head of the tibia. A sequestrum nine and a half inches long was then removed, also several small pieces, and in the operation a longitudinal piece of newly formed bone had to be withdrawn. After the removal of the necrosed portion, new bone was found of sufficient thickness to hold the foot in its proper position. The loss of blood during the operation amounted to about ten ounces. The wound was dressed with charpie and cold water, and the patient took stimulants and an anodyne every four hours. On the next day he was very weak and had continued nausea, no appetite, and vomited all food as soon as swallowed, not being able to retain brandy even, which increased the nausea. Two ounces of beef tea was then given every four hours, but it also was nearly all thrown off. On April 27th, he was still weaker and the nausea continued, when two ounces of champagne with ice was administered every four hours, and four ounces of beef tea, per enema, was given three times a day. This was continued for two days, when the patient had a well-marked chill and was sinking fast, his nausea having increased to such an extent that the sight of other patient's food caused him to vomit. On April 30th, he was worse in every respect, when doses of five grains of oxalate of cerium was ordered to be given whenever the patient felt as though he would immediately vomit. By 9 o'clock P. M. he had used six powders, not having vomited once since taking the first, and having retained food eaten at noon. The champagne and beef tea were continued. By May 6th great improvement was noticed, and, there being no nausea or vomiting, the powders were discontinued. The wound was now granulating finely, and the discharge consisted of perfectly healthy pus. About June 25th, the patient could leave his bed and sit in a chair, the cavity having nearly filled and the wound being healthy and reduced to about half the size of the incision. He had perfect use of the ankle joint and the tibialis anticus muscle, and there was all probability of a very useful limb. By July 15th, he could bear considerable weight on the injured leg." The patient was subsequently transferred to Douglas Hospital, where he was discharged from service by special order of the War Department, October 13, 1865. In his publication[1] of the case Dr. Leale mentioned Surgeon D. W. Bliss, U. S. V., as the operator, and added that he saw the patient again just before he left Douglas Hospital, at which time the limb was in a healthy condition and the wound had nearly closed, leaving three small openings, which were prevented from closing by the great tension on the newly formed integuments. There was also slight contraction of the tendo-achillis, which could be easily overcome, although every possible care had been taken to guard against that result. The patient's name was subsequently admitted on the Pension Rolls, and afterwards he obtained employment in the New York City Custom House. Dr. G. K. Smith, of Brooklyn, May 11, 1874, certified that the patient, after receiving his discharge from service, entered Bellevue Hospital, New York City, where "Professor J. R. Wood performed an operation on his leg, cutting the tendo-achillis, and, I think, he also removed a large portion of the fractured bone. The wound healed in 1866, but soon broke open again, and continued to discharge until the month of June, 1873, when it finally healed. After leaving Bellevue Hospital he came under my care, and though his health was feeble, he performed his duties at the Custom House, with occasional loss of time, until the wound healed, in June, 1873. From that date his health failed rapidly. His liver began to

FIG. 267.—A sequestrum, 9½ ins. long, from the right tibia. *Spec.* 1489.

[1] LEALE (C. A.), *Extensive Necrosis of the Shaft of the Tibia following Gunshot Fracture of the Bone*, in *United States Sanitary Commission Memoirs*, Surgical Volume I, New York, 1870, p. 492.

increase in size, the heart became irregular in its action, respiration difficult and circulation very feeble. At length dropsy set in, and he died December 1, 1873. An external examination showed the liver to be nearly twice its normal size, and I have no doubt that death was caused by a waxy degeneration of the liver, the result of the shot fracture."

CASE 691.—Captain E. Bernard, Co. 1, 65th New York, aged 29 years, received a gunshot wound through the left leg just below the knee, fracturing the tibia and fibula, at Malvern Hill, July 1, 1862. He was conveyed to Harrison's Landing, and thence by steamer to Fort Monroe. From there he proceeded to his home in New York City, where he obtained the professional attendance of Dr. L. A. Sayre, who subsequently furnished the following report of the case: "I was called to see Captain Bernard on July 12th, when he had just arrived from Fort Monroe, and was supposed to be in a dying condition from septicæmia. Many surgeons who had seen him at Harrison's Landing and Fort Monroe had all advised amputation of the wounded limb. The leg had become about two and a half inches shorter than the other and very much twisted on its axis. Extensive suppuration extended up the thigh and down the leg, both openings having been hermetically sealed with closely packed lint, which, when soaked off, caused the escape of a greater amount of imprisoned pus than I have ever seen from a single wound. Mingled in the pus there was also a large quantity of very finely broken up and macerated bone, and over the tubercle of the tibia a loose fragment was detected which, when cut down upon, escaped, having the appearance of a polished metal, like a silver sixpence, and the shape of a hollow segment of a robin's egg. This fragment, which, before extracting, I had suspected to be a loose piece of bone, the patient declared to be 'the end of an explosive ball.' His thigh at this time was so infiltrated with pus as to make amputation hazardous. I therefore made free incisions for its escape and drainage, and treated the limb by extension and plaster-of-paris, using adhesive plaster, weight and pulley over the foot of the bed, which was elevated to make the body act as a counter-extending force. Several large fragments of bone, having been macerated in the pus so long, were subsequently easily picked out without removing the periosteum. He made a very satisfactory recovery with but very little shortening, although there must have been more than an inch of entire bone removed. There is still (1874) a small piece of dead bone remaining, which, however, gives no trouble as long as he wears the tent to keep up the drainage. Whenever he leaves this out and the wound closes, he becomes sick until the discharge again takes place. I have been anxious to remove the diseased part, but he can never find time for that purpose, having to work constantly for his living and being too poor to lay up for the operation." The New York City Examining Board, on October 1, 1877, reported the sinus leading to dead bone as still open, having never ceased to discharge, and requiring constant dressing. Captain Bernard obtained his discharge from service October 22, 1863, and has since become a pensioner. He was paid September 4, 1880.

In a number of cases of recovery after shot fracture of both bones of the leg, the knee joint or the ankle joint or both became partially or totally anchylosed:

CASE 692.—Major A. J. Bolar, 12th Pennsylvania Reserves, aged 31 years, was wounded in both legs and captured at Fredericksburg, December 13, 1862. After remaining a prisoner some weeks he was exchanged and conveyed to Annapolis, where he was admitted to hospital on February 21, 1863. Acting Assistant Surgeon J. H. Longnecker reported: "This officer was wounded in the left leg by a round ball entering three inches below the knee joint and fracturing the fibula; also by a buck-shot in the same locality and a minié ball entering the external upper third of the leg. There was compound fracture of both the tibia and fibula. The ball has never been found, and is supposed to have lodged in the muscular part of the leg. The right leg was also wounded by a minié ball entering at the outer tuberosity and passing under the patella. At the time of admission the wound of the right leg was open and discharging. On September 9th, when the patient was put under my care, it had closed and there was anchylosis of the knee joint. The left leg was very much swollen and inflamed, there being two angry looking ulcers about three or four inches below the knee joint, with a tendency to sloughing. The patient's general health was good. Charcoal poultices were ordered, to be renewed twice a day. On September 21st, flaxseed was substituted for the charcoal, the wound looking more healthy and granulating, with not so much swelling or redness, and the pain less acute. On October 1st, two small fistulous openings remained, discharging a thin, sanious, and offensive ichor with small parts of decayed bone, which were injected with a mixture of opodeldoc and sweet oil twice a day. By November 1st, the discharge was much less and of a better quality, the leg of natural size, and the patient able to walk much easier with the aid of crutches. About December 1st, there was still slight discharge, the pus being mixed with small black particles, indicating exfoliation. Gradual improvement continued, and one month later the patient was able to walk by the support of a cane." He was honorably discharged from service January 30, 1864, and subsequently entered the Veteran Reserve Corps, being ultimately mustered out June 6, 1865, and pensioned. Examining Surgeon G. R. Lewis, of Indiana, Pennsylvania, certified, February 8, 1867: "The pensioner was wounded in the left leg by several balls, one being still unremoved. The wound is still discharging and requires to be dressed daily. He was also wounded in the right knee, the ball lodging. Complete anchylosis resulted." On September 21, 1875, the same Examiner reported: "The ball in the left leg has not been removed and the wound still discharges, etc. There is partial stiffness of the knee joint, and he is totally disabled for manual labor." Examiner M. L. Miller, of Blairsville, Pennsylvania, September 4, 1877, certified to the injuries and added: "There has been much muscular waste and tenderness of the parts (left leg), and there is discharge of offensive matter from the place of injury, requiring daily dressing." The pensioner was paid September 4, 1880.

CASE 693.—Assistant Surgeon A. H. Landis, 35th Ohio, aged 39 years, was wounded near Kenesaw Mountain, June 22, 1864, by a twelve-pound solid shot, which, after hitting a tree and bounding off, struck his right leg, causing fracture but not breaking the skin. Surgeon F. D. Morris, of the regiment, reported that the missile fractured both bones of the limb midway between the knee and the ankle, and that the soft parts were much contused. The patient was admitted to the field hospital of the 3d division, Fourteenth Corps, where he received a leave of absence on the following day. He was mustered out of service September 27, 1864, and pensioned. Examining Surgeon J. S. McNeeley, of Hamilton, Ohio, certified, October 31, 1865: "The leg was struck at the posterior part of the middle third, fracturing both the tibia and fibula and lacerating the gastrocnemius and soleus muscles. The resulting cicatrices have formed adhesions to the adjacent parts, entirely destroying their action. In adjusting the fracture complete apposition was not attained, and, from extension of inflammation, there is partial anchylosis

of both knee and ankle joints, rendering locomotion both painful and difficult." Subsequent examiners report no additional information. The pensioner was paid September 4, 1879.

Both bones of the left leg as well as of the left forearm were fractured in the next case. The arm was amputated at the middle third, but the patient was so utterly prostrated that amputation in the leg was deemed inadvisable:

CASE 694.—Sergeant J. McLeer, Co. C, 84th New York, aged 23 years, was wounded by a shell in the left arm and left leg, at Bull Run, August 29, 1862. He entered Mount Pleasant Hospital, Washington, several days afterwards. Assistant Surgeon C. A. McCall, U. S. A., in charge, describes the injury of the arm as a compound comminuted fracture of the radius, ulna, and elbow joint, and that of the leg as a fracture of the tibia and fibula, lower third, and reports: "On or about the 2d of September I amputated the arm at the middle third (*Second Surgical Volume*, TABLE LXXVIII, p. 765, No. 167), and would have also amputated the leg, but that the utter prostration of the patient threatened death upon further surgical procedure. Operating on the leg was therefore left to a future time; but as symptoms of promise developed themselves afterwards, an effort was made to save the leg, which, after long and critical treatment, was successful, although the limb was left somewhat shortened and to a considerable extent unfit for useful progression. The case was one of singular interest to myself and staff, proving as it did the wonderful endurance of the human system and the almost strained limit to which conservative surgery may trust nature. It had been looked upon and classed by me as an excision of the lower portion of both bones of the leg: for though no special operation was performed, yet I know I was over half an hour cleaning out the broken fragments and adjusting loosened spiculæ before trusting it to the fracture-box." In a published account of the case[1] it is mentioned that, under a tonic and stimulant treatment and the application of simple absorbent dressings to the parts, the stump of the arm healed rapidly. The patient was discharged from service July 27, 1863, and pensioned. On September 22, 1880, he was examined by the Brooklyn Pension Board, who certified to the loss of his left arm and added: "There is evidence of a compound comminuted fracture of the tibia and fibula of the left leg in the lower third. Portions of both bones were removed. The cicatrices of entrance and exit of the missile are found upon the internal and anterior aspects of the part. In the latter situation, over the tibia, a firmly adherent cicatrix, three inches long by one inch wide, is present. The leg is bowed outward to a very marked degree, the fibula being very prominent and thickened. There is shortening of the limb of about one inch. The extensor tendons are not full in their movements, being partially bound down by cicatricial tissue, and the ankle is somewhat stiffened and restricted in its motion. The great toe is not supple, since the plantar tendons are somewhat contracted. Altogether the objective signs show that the original wound was of the most severe character. In manual labor, walking, standing, etc., the member would speedily become the seat of great swelling and pain, as is the case after any unusual exercise."

Fatal Cases of Shot Fractures of both Bones of the Leg treated by Conservation.—Of the seventy-five instances of shot fractures of the tibia and fibula with fatal issues three will be detailed:

CASE 695.—Private G. F. Skinner, Co. H, 6th Maine, aged 30 years, was wounded at Chancellorsville, May 3, 1863, and admitted to Douglas Hospital, Washington, five days afterwards. Assistant Surgeon C. C. Lee, U. S. A, reported: "This man suffered a comminuted fracture of the left leg from a musket ball, which entered one-half inch internally to the spine of the tibia, passed through antero-posteriorly, and emerged at a corresponding point at the back of the leg. Much contusion and ecchymosis existed at the time of his admission to the hospital, and but for the high state of inflammatory action then existing the leg would have been removed. The limb was then placed in a fracture-box filled with bran, and covered with water dressings; nutrients and stimulants were given freely. No change was perceptible until the morning of May 16th, when the foot and leg were found in a state of advanced gangrene. To show how rapidly this condition supervened it is only necessary to state that a most careful examination during the previous evening failed to reveal anything of the kind, the patient in all respects seeming as well as usual. By the next morning this condition of the leg was rapidly extending up the thigh, the soft tissues of which became boggy and crepitant; the patient being bathed in clammy sweats, and his circulation so depressed that the pulse was imperceptible at the wrist, though at the groin it was 160 per minute. At the same time the patient's spirits were not at all depressed, and he could hardly believe he was in any danger. His prostration was such that amputation was deferred; but the most energetic stimulation failed to bring his condition into one of sufficient reaction to bear the operation. He gradually sank, and died at 2 o'clock on the morning of May 17, 1863. At the autopsy, the internal organs were discovered to be generally healthy. The bone was found to be extensively comminuted, with a portion of the bullet lying upon the lacerated and obliterated posterior tibial vessels, thus probably furnishing the main cause of the gangrene. No secondary abscesses were found, and it was concluded that the patient had died in the primary stage of blood poisoning." The upper halves of the injured bones, showing a transverse fracture of the fibula and comminution of the tibia, with the battered bullet attached, were contributed to the Museum by Assistant Surgeon W. Thomson, U. S. A., and are shown in the annexed cut (FIG. 268).

FIG. 268.—Shot fractures of upper third of left tibia and fibula. *Spec.* 1249.

CASE 696.—Private J. Bailey, Co. B, 211th Pennsylvania, aged 29 years, was wounded at Petersburg, April 2, 1865. Surgeon A. F. Whelan, 1st Michigan Sharpshooters, reported his admission to the field hospital of the 3d division, Ninth Corps. with "Canister shot fracture of right leg." Surgeon E. Bentley, U. S. V., recorded the result of the injury as follows: "The

[1] COUES (ELLIOTT), *Report of some Cases of Amputations and Resections from Gunshot Wounds, performed at the Mount Pleasant U. S. General Hospital by* C. A. MCCALL, M. D., U. S. A., in *Medical and Surgical Reporter*, New York, 1862-3, Vol. IX, p. 229.

man was admitted to Slough Hospital, Alexandria, four days after receiving his wound. The tibia and fibula were badly shattered. Cold-water dressings were employed, and tonics and stimulants were freely administered, together with all the nourishment the patient would take. He died May 2, 1855, from the severity of suppurative inflammation of the wound. The autopsy showed the tibia to be comminuted for several inches at the upper third and the fibula fractured at the lower third, no union having taken place. The wound was gangrenous."

In the following instance of lesion of both bones of the leg in the middle third, osteomyelitis of the medulla of the femur was noted at the autopsy. The upper and lower thirds of the tibia were found upon opening to be quite healthy:

CASE 697.—Musician G. H. Potter, Co. E, 60th Ohio, aged 14 years, was wounded in the right leg, before Petersburg, July 16, 1864. Surgeon P. A. O'Connell, U. S. V., recorded the following description of the injury at the field hospital of the 3d division, Ninth Corps: "A ball entered the outer side of the limb about the upper third of the fibula; exit below on anterior aspect, gouging tibia and fibula." The wounded man was conveyed to the Depot Hospital at City Point the day after the injury, and one week later he was transferred to Fairfax Seminary Hospital. Assistant Surgeon H. Allen, U. S. A., in charge of the latter, made the following report: "On entering the hospital the lad was in fine spirits, though somewhat anæmic; wound looking well. On August 5th, the wound assumed an indolent appearance and the discharge became greater and more fetid. Bromine was thoroughly applied in the ordinary way and at first checked the progress of the disease. But the patient appeared to have no recuperative energy and a tendency to subcutaneous sloughing was evinced, which, by the 12th of August, had increased so far as to necessitate the slitting up of the integuments and a second rigorous application of bromine. It was observed during the operation that the tibia was exposed and a superficial area of bone was being thrown off. The patient was exceedingly irritable, appetite capricious. The wound still presented a gluing and unhealthy appearance, and the tendency to undermining continued in spite of all efforts to check it. The patient gradually sank. By September 15th, violent and persistent vomiting came on, and from this time until the date of his death, September 26, 1854, he was almost entirely sustained by beef tea enemata. He had no chills and no discoloration of skin, and his mind at all times was clear. Autopsy: emaciation extreme; limb not much swollen; foot somewhat œdematous; ulcer extending from four inches below the knee to the ankle joint; femoral vein healthy; internal organs all healthy except the liver, which was exceedingly fatty. The outer surface of the tibia at the middle third was dead and much blackened from the action of the vapor of the bromine, and the living bone around its borders was covered with several roughened spiculæ of bone. Upon opening the tibia the upper and lower thirds were found to be quite healthy, but the middle third was the seat of varied diseased action. The walls at this point were partially necrosed, of a greyish slate color, roughened, and so thin that at one point they appeared to be nearly destroyed. The medullary substance at this place was shrunken, of a blackish grey color, and closely adherent to the posterior and lateral walls of the cavity. No new deposit of bone was seen. The tissues both above and below this point had taken on active efforts of repair. The cavity of the medulla was much contracted by delicate cancelli extending from either side, and the original walls of the cavity for the extent of a full inch either way were vascular and thickened. The medulla lying in the diminished calibre of canal was of a lively red color, filled with blood, and presented all the appearance of a highly nourished medium. As above observed, no inflammation was noticed in either extremity of the affected bone. Upon examination of the femur an interesting appearance was presented. The walls of the bone were much thickened and dotted with reddish spots; the enlarged nutritious arteries and the periosteum were also thickened, vascular, and easily detached. When the bone was opened the upper two-thirds of the medulla were found to be acutely inflamed, which as usual was more intense towards the neck of the bone than elsewhere." The tibia and fibula of the injured leg, contributed, with the history, by Dr. Allen, constitute specimen 2633 of the *Surgical Section* of the Museum.[1]

The precise seat of the bony lesion was not indicated in seven hundred and eighty-six of the three thousand nine hundred and eighty-eight cases of shot fractures of the bones of the leg treated by conservation. The results in sixty-nine of these cases were not ascertained; five hundred and forty-three patients recovered and one hundred and seventy-four died, a mortality of 24.2 per cent.

An analysis of the cases of shot fracture of the bones of the leg treated by conservation indicates that pyæmia was noted in eighty-one instances (six recoveries and seventy-five deaths), gangrene in seventy (forty recoveries, thirty deaths), tetanus in twenty-four (two recoveries, twenty-two deaths), erysipelas in forty-five (thirty-five recoveries, ten deaths), and in three hundred and forty-seven cases (two hundred and ninety-nine recoveries, forty-two deaths, and six undetermined results) fragments of bone or sequestra were removed. Secondary hæmorrhage is reported in sixty-five instances (twenty-four recoveries, forty-one deaths), and in twenty-six instances ligation of the tibial, popliteal, or femoral arteries were performed, viz: ligation of anterior tibial artery in five (three recoveries, two deaths); of anterior tibial and popliteal in one (fatal); of anterior and posterior tibials

[1] ALLEN (H.), *Remarks on the Pathological Anatomy of Osteomyelitis, with Cases. Gunshot Wound of the Right Leg; phagedena; no pyæmia;* in *American Journal Medical Sciences*, 1865, Vol. XLIX, N. S., p. 44.

in one (fatal); of posterior tibial in eight (five recoveries, three fatal); of —— tibial in one (fatal); of popliteal in five (two recoveries, three fatal); and of femoral in five (two recoveries and three fatal). Details of the five cases of ligation of the femoral artery are adduced:

CASE 698—Private *J. W. Moore*, Co. I, 13th Mississippi, aged 23 years, was wounded and captured at Gettysburg, July 2, 1863. Surgeon H. Janes, U. S. V., reported: "Compound fracture of right leg, middle third. Hæmorrhage from the posterior tibial artery occurred to the amount of one pint daily from July 12th to July 17th, when the femoral artery was ligated in the continuity." The patient recovered, and was transferred to Baltimore October 15th, the wound having entirely healed. Surgeon T. H. Bache, U. S. V., reported that he was paroled from West's Building Hospital, and sent south November 12, 1863.

CASE 699.—Corporal P. Lahany, Co. G, 5th Vermont, aged 21 years, was wounded at Petersburg, April 2, 1865, and admitted to the field hospital of the 2d division, Sixth Corps, where Surgeon S. F. Chapin, 139th Pennsylvania, recorded: "Shot fracture of left leg." Surgeon D. P. Smith, U. S. V., reported the wounded man's entrance into Fairfax Seminary Hospital, April 6th, with "Shot fracture of left fibula," but made no record of any surgical treatment in the case. On May 30th, the patient was transferred to Baxter Hospital, Brattleboro', and subsequently to Sloan Hospital, Montpelier. Surgeon H. Janes, U. S. V., in charge of the latter, contributed a photograph of the patient, which is copied in the wood-cut (FIG. 269), together with the following history: "The wound was produced by a minié ball, which entered the leg on the outer side two inches below its middle, passed backward and inward, fracturing the fibula, and emerging posteriorly one inch lower than the point of entrance. Several fragments of bone were removed on the field four hours after the injury. Secondary hæmorrhage occurred on April 9th, for which the femoral artery was ligated in Scarpa's space by Dr. Smith, at Fairfax Seminary Hospital. The patient was much prostrated after the operation, and artificial heat was required for about a week to keep up the temperature of the limb. No recurrence of the hæmorrhage took place, and the wound closed rapidly after the operation. At the time of his admission to Sloan Hospital, June 12th, both wounds were nearly healed and he could walk without crutches, but could not bring the heel to the ground on account of contraction of the muscles of the calf. In the early part of July an abscess formed at the place of ligation, which healed however in a short time. On August 11th, the patient was discharged from service, though unable to leave the hospital on account of an abscess at the original wound, caused by a fragment of necrosed bone. Three weeks afterwards the abscess had nearly healed and he left the hospital in good health, but still unable to get the heel to the ground. This patient had also been wounded through both buttocks, at the Wilderness, May 5, 1864, from which injury he had recovered in three months, when he rejoined his command for duty." Various surgeons, at consecutive intervals, certified to the injuries, and Examiner F. W. Goodall, of Bennington, October 5, 1877, adds: "The left leg below the knee is one-half smaller than its mate, one-half smaller at the calf, and one-quarter at the ankle; muscles attached to the integument on back of leg, impairing the action of the tendo-achillis. I also find a large cicatrix in the left triangle of Scarpa, from ligation of the femoral artery." The pensioner was paid March 4, 1880.

FIG. 269.—Shot fracture of left fibula and ligation of femoral. [From a photograph.]

CASE 700.—Corporal J. Ferguson, Co. G, 142d Pennsylvania, was wounded in the right leg, at Fredericksburg, December 13, 1862. He remained at a First Corps field hospital for one week and was then transferred to the Patent Office Hospital, and subsequently to Stanton Hospital, Washington. Surgeon J. A. Lidell, U. S. V., in charge of the latter, described the case as follows: "The wound was produced by a bullet, which passed through the calf of the leg in the upper third in a downward and outward direction. The wound did well until the middle of January, when the granulations assumed an unhealthy appearance and the discharge became thin and serous. The patient also exhibited typhoid symptoms, having a hot skin, frequent pulse, and dry red tongue, watchfulness, and no appetite. This went on until the morning of January 23d, when hæmorrhage occurred unexpectedly from the external orifice behind the fibula. The bleeding was readily controlled by application of pressure by bandage and ice, the patient having lost about ten ounces. Throughout the day and the night following the loss of blood by oozing was very little, but on the following morning hæmorrhage recurred from the internal orifice, behind the tibia this time. This amounted to from four to six ounces, and was also readily controlled by the application of persulphate of iron, lint, ice, and bandaging. In the meantime the typhoid symptoms became more marked. The patient also complained of great tenderness throughout the leg and thigh; the inguinal glands were somewhat swollen and tender, and there was dusky redness, with soreness in the track of the long saphenous vein. His skin was now pale and yellow. On the morning of January 25th, another slight bleeding occurred from the internal wound and was readily controlled by pressure. A marked increase of the swelling was now noticed, extending from the leg to the thigh, especially over the external and internal condyles and the popliteal space, and infiltration with blood was suspected. The patient was now very pale and expressed a great deal of anxiety, his pulse being 120, quick and weak. The first day the hæmorrhage was thought to come from the peroneal artery, the next day from the posterior tibial, but now we were uncertain in regard to the source of the bleeding, and the case presented an unpromising appearance on account of the debility from the loss of about eighteen ounces of blood superadded to his typhoid condition. We then decided to tie the femoral artery at the apex of Scarpa's space as affording the best chance of benefit, which operation I performed without any difficulty on the afternoon of January 25th, forty-three days after the reception of the wound. On the following morning the patient appeared brighter; pulse 130; tongue more moist; leg getting warmer down to the ankle. The plugs being removed some dark offensive blood flowed away. In the evening his foot was cold, leg cooler, and blackness was extending across the leg in the track of the wound. Patient had a slight chill; somewhat delirious; pulse 130 and weak; tongue dry. On the morning of January 27th the patient looked better; pulse 132 and stronger; leg warm and blacker; foot pale and swelled; serous infiltration and discoloration extending up the thigh. The next day the patient presented a pale yellow hue; blackness of limb deepening and extending, having reached the lower end of the incision made for the liga-

tion; odor gangrenous. Death supervened on the evening of January 29, 1863. The autopsy showed that the bleeding did not come from the posterior tibial or peroneal artery, but from the lower part of the popliteal, which had been opened to a large extent by ulceration. Some loose splinters of bone were also found, the ball having grazed the hind part of both the tibia and fibula. On the proximal side of the ligature the clot was firm, closely attached to the walls of the artery, and about three-fourths of an inch long, with its apex pointing upward towards the heart. There was also a firm clot on the distal side, adherent to the walls of the artery, but much smaller than the proximal one." A piece of the femoral artery, about four inches long and embracing the seat of the ligature, was contributed to the Museum by Surgeon Lidell, and constitutes specimen 1140 of the *Surgical Section*.

CASE 701.—Sergeant J. Daly, Co. K, 82d New York, aged 27 years, was wounded in the left leg, at the Wilderness, May 6, 1864, and admitted to Douglas Hospital, Washington, six days afterwards. Assistant Surgeon W. Thomson, U. S. A., described the injury as "a gunshot fracture of the fibula," and reported: "On May 17th, a bullet was extracted from the inner side of the leg, through a deep and oblique incision two or three inches below the knee. Three days afterwards three hæmorrhages occurred from the posterior tibial artery, amounting to one, three, and ten ounces respectively, and necessitating ligation of the femoral artery, which was performed below the profunda in Scarpa's space by Assistant Surgeon W. F. Norris, U. S. A. Ether was used as the anæsthetic. On the following day there was venous hæmorrhage to the amount of four ounces. A further loss of eight ounces of blood took place on May 25th, and of one and a half ounces the next day. Four more attacks followed on June 1st, each causing the loss of one-half ounce to an ounce of blood, and being checked by compression over the femoral where it emerges from the pelvis. Death resulted from exhaustion, June 3, 1864. At the *post-mortem* examination the ligature was found to have nearly sloughed through; clot below, but none above it."

CASE 702.—Corporal *H. Day*, Co. A, 6th Alabama, was wounded in the right leg, at Chancellorsville, May 3, 1863. The records of Chimborazo Confederate Hospital No. 4, Richmond, show his admission May 14th, with the following description of the injury and its result: "The ball entered at the external malleolus, slightly fracturing the fibula, ranging upward and inward, and making its exit about an inch and a half from the posterior edge of the tibia and about four inches from the knee joint. On May 26th, a hæmorrhage from the upper wound estimated at from ten to twelve ounces, and probably coming from the posterior tibial artery, was arrested by compression of the femoral on the pubis, after which a tourniquet was applied to the thigh. On May 28th, another hæmorrhage occurred from the upper wound and from fifteen to twenty ounces of blood were lost, when it was checked by introducing the fingers into the wound and seizing the vessel and adjacent tissues. Ligation of the femoral artery was then performed. The tissues were found to be disorganized and reduced to a soft pulpy mass, in which it was impracticable to define any healthy structure. While preparing for the operation the patient had a slight convulsion, and for a few moments all proceedings were suspended in anticipation of immediate death. Hæmorrhage did not recur after the operation. On June 2d, there was a slight chill followed by fever. On the next day the discharge from the upper wound was of a greenish-gray color, offensive in odor, and indicative of gangrene. Gangrenous symptoms increased, and by June 4th the foot and leg were livid and swollen, odor very offensive. He died in a comatose condition, June 5, 1863, the whole leg and thigh having become thoroughly gangrenous. It is probable that the posterior tibial artery was not divided by the ball, but opened by the softening of the tissues subsequent to the occurrence of the wound."

EXCISIONS IN THE CONTINUITY OF THE BONES OF THE LEG FOR SHOT INJURY.—Three hundred and eighty-seven examples of excision in the bones of the leg are recorded. Two hundred and fifteen, or over one half of the total number of these operations, were primary, eighty-seven intermediary, and fifty secondary; in thirty-five instances the interval between the dates of injury and operation could not be ascertained. Two hundred and seventy-five of the patients survived the operation, one hundred and eight died, and in four the results were undetermined, a mortality rate of 28.2 per cent. In comparing the results of the excisions and amputations in the long bones of the upper extremity it will have been noticed that in the upper arm the fatality of the excisions (28.5) exceeded that of the amputations (23.6) by 4.9 per cent., while in the forearm the mortality of the amputations (13.9) was 2.7 per cent. in excess of the death rate of the excisions (11.2). Similarly, in the lower extremity, we find that while the fatality of the excisions in the shaft of the femur (69.4) surpasses that of the amputations through the thigh (53.8) by 15.6 per cent., the excisions in the continuity of the bones of the leg show a death rate of 28.2 per cent., or 4.7 per cent. less than the fatality after amputations in the leg (32.9 per cent.). It would appear, therefore, that in the arm and thigh amputations were less fatal than excisions, while in the forearm and leg the mortality of the amputations exceeded that of the excisions. The low rate of fatality after excisions in the forearm or leg may be ascribed to the fact that in the large majority of the cases of recovery portions of one of the bones of the forearm or the leg only were excised; in the cases in which the excision extended to both bones of the limb, the mortality exceeded that of the amputations.

Primary Excisions in the Shaft of the Tibia, of the Fibula, or of both bones.—The series of two hundred and fifteen primary excisions in the bones of the leg contains one hundred and forty-eight recoveries and sixty-seven deaths, a mortality rate of 31.1 per cent. Portions of the tibia were excised in ninety-nine, of the fibula in one hundred and ten, and of the tibia and fibula in five instances; in one case the seat of excision was not specified. The operations were performed on one hundred and ninety-two Union and twenty-three Confederate soldiers.

Recoveries after Primary Excisions in the Continuity of the Bones of the Leg.—There were one hundred and forty-eight recoveries after primary excisions in the continuity of the bones of the leg; in sixty-nine, portions of the tibia, and in seventy-eight, parts of the fibula had been excised; in one instance the bone was not indicated. No instances of recovery after primary excision in both bones of the leg are recorded. The one hundred and forty-eight operations were performed on seventeen Confederate and one hundred and thirty-one Union soldiers. Of the latter one hundred and twenty-four were pensioned; but ten have died since the date of their discharge—two of phthisis, and three of remote effects of the injury; in five instances the cause of death was not reported. In the following five cases from three to six inches of the tibia were excised:

CASE 703.—Private J. Hogan, Co. F, 127th Pennsylvania, aged 41 years, was wounded in the right leg, at Fredericksburg, December 13, 1862. Surgeon J. E. MacDonald, 79th New York, reported his admission to the field hospital of the 1st and 2d divisions, Ninth Corps, and described the injury as "fracture of the tibia," for which "resection of six inches" of the bone was performed. Assistant Surgeon W. Thomson, U. S. A., contributed the following history of the case: "This man was struck by a minié ball four inches below the knee joint. The tibia was extensively comminuted, the fibula being uninjured. A resection of the shaft of the tibia from a point just below the tubercle to (about) seven inches below was performed by Surgeon J. P. Prince, 35th Massachusetts, at a field hospital. The man was admitted to Douglas Hospital December 26th. The dressing consisted in keeping the incision open with charpie to encourage granulations from the bottom of the wound. On February 25, 1863, a crown-shaped exfoliation (*Spec.* 2237, *Sect.* I, A. M. M.) was removed from the end of the lower portion of the tibia. The wound now healed rapidly, no change having been made in the dressing and the leg being retained in quietness by a fracture box filled with bran. His general health became perfect as the discharge ceased. On May 1st, several small exfoliations were removed from the spongy portion of the tibia at the superior part of the wound. There was of course no reproduction of the tibia and no conservative hypertrophy of the fibula, and hence the leg was perfectly helpless. Before the fistulous orifice had entirely closed at the upper portion of the incision, well marked but mild hospital gangrene appeared. The sloughing extended very deeply as far as the lower side of the tibia. Several applications of bromine checked the spread of the gangrene but not until a large excavation had been caused. This filled up gradually, the patient got up on his crutches and with the aid of a starched bandage hobbled painfully about the wards. His term of enlistment expired on May 29, 1863, but he remained until October 12th, when he returned to his home. No more useless or unphilosophical operation could be devised than the one done in this case. The leg was perfectly helpless, a hiatus of nine or ten inches existing in the tibia and there being no hope of any further improvement from the lapse of time; fibula no larger than natural. Unless some novel means of support can be

applied this man will be infinitely worse off than with an artificial leg." Examining Surgeon S. T. Charlton, of Harrisburg, reported in October, 1866: "There is complete atrophy of the whole limb, as well as deformity from curvature at the point of resection and the pushing out of the head of the fibula from its articulation. He cannot walk or stand upon the limb without the use of a cumbrous apparatus furnished by the Government," etc. At subsequent examinations no change or improvement was reported. The pensioner died May 24, 1877.[1]

CASE 704.—Lieutenant O. R. Fyler, Co. I, 2d Connecticut Heavy Artillery, aged 25 years, was wounded in the left leg, at Opequan Creek, September 19, 1864. He was admitted to the field hospital at Winchester, where Surgeon E. B P. Kelly, 95th Pennsylvania, recorded a "shot fracture of the tibia, middle third, by a minié ball, followed by exsection, the same day, of three inches of the bone by Surgeon H. Plumb, 2d Connecticut Artillery." Acting Assistant Surgeon J. H. Bartholf made the following report: "The patient entered Frederick Hospital on November 12th. On December 15th, I discovered and removed the ball, or what appeared to be the greater part of it, from the lower part of the wound, close to the upper extremity of the lower fragment. It was embedded about two inches and found to be exceedingly battered and misshapen. The patient informed me that Smith's anterior splints were used and continued for three weeks after the injury. A plaster-of-Paris splint was then applied, with which he came here, having traveled by the rough railway from Winchester without inconvenience. I found him with his limb looking well, but there was no union of bone and no coaptation even of the ends, the fibula of course holding the extremities apart. Besides removing the ball, as stated, and a few small fragments of bone, the patient's treatment in this hospital consisted of simple dressings and the continued use of the plaster-of-Paris splint. On January 13, 1865, he left on leave of absence, his general condition being excellent and the wound presenting a granulating surface five inches long. No deposit of bony matter in the interspace between the ends of the bone could be discovered. The sawn face of the upper fragment came away in the early part of January." The patient was discharged from service April 6, 1865, and pensioned, and subsequently supplied with a supporting apparatus for his injured limb by Dr. E. D. Hudson, of New York City. Examining Surgeon H. E. Gates, of Litchfield, Connecticut, certified, June 4, 1877: "The wound was from a minié ball received directly in front, striking the tibia, mashing that bone and lodging in it; it remained there two months, causing exfoliation, profuse discharge, and an attack of gangrene. Resection was done the day the injury was received, the periosteum being removed (or badly torn) with three inches of the bone. It is supposed that the periosteum was so badly torn as not to be able to repair the loss of bone substance. Present aspect: whole leg and thigh atrophied. The fibula is bowed outward and there is partial dislocation of its head. The leg bends easily at the seat of the injury and no weight can be borne upon it. I have no doubt the fibula would instantly give way if the applicant stood upon it. There is great tenderness at the head of the fibula from stretching of the ligaments, the line of support from the bending of the leg being thrown outward towards this articulation. The pensioner wears an appliance weighing seven pounds, which incases the limb and gives the only support. The disability is progressive on account of displacement and bending of fibula, etc. I consider his present condition worse than if he had amputation above the knee; locomotion is very painful indeed," etc. The pensioner was paid March 4, 1880. In the accompanying wood-cut (FIG. 270) the appearance of the limb about one year after the excision is shown.

FIG. 270.—Excision of three inches of the left tibia. [From a photograph.]

CASE 705.—Colonel W. T. Fitch, 29th Ohio, aged 40 years, was wounded at Mill Creek, May 8, 1864. He entered the field hospital of the 2d division, Twentieth Corps, where Surgeon A. Ball, 5th Ohio, recorded: "Shot compound fracture of right tibia; resection at middle third by Surgeon A. K. Fifield, 29th Ohio." Surgeon J. E. Herbst, U. S. V., reported that the patient entered the Officers' Hospital, Nashville, four days after he was wounded, having undergone excision of about three inches of the shaft of the tibia by a longitudinal incision of four inches over the crest. Chloroform was used and prompt reaction followed the operation. The limb was placed in a box-frame splint and wet applications were made. On June 20th the patient left for his home on leave of absence, the wound being in excellent condition. On October 13, 1864, Colonel Fitch resigned and obtained his discharge from service, and subsequently he became a pensioner, his physician testifying that "the wound on the surface has healed, but the vacancy caused by the removal of the bone has not yet filled up." Examiner W. M. Eames, of Ashtabula, Ohio, certified, September 15, 1865, that "the leg is now very small and weak and of no manner of use in walking, a source of constant discomfort. The foot is cold and swollen and not under the control of the muscles." On December 8, 1870, when the pensioner visited the Army Medical Museum, he was in good general health and his wound soundly healed; but the bone remained ununited, the calf of the leg entirely atrophied, and the foot swollen and useless. He also stated that "he regretted greatly that amputation had not been performed." The Cleveland Examining Board at subsequent dates reported that the pensioner was obliged to wear steel splints on the outer and inner aspect of the leg. In September, 1877, the cicatrix was described as being quite irritable and as ulcerating and discharging often. The pensioner was paid December 4, 1879.

CASE 706.—Private D. M. Gould, Co. D, 102d New York, aged 21 years, was wounded in the left leg, at Dallas, May 27, 1864. Surgeon A. Ball, 5th Ohio, reported his admission to the field hospital of the 2d division, Twentieth Corps, with "shot fracture of tibia; resection of four inches by Surgeon C. H. Lord, 102d New York." Ten days after receiving the injury the wounded man was conveyed to Chattanooga, and subsequently he passed through different hospitals, entering Ira Harris Hospital, Albany, on February 9, 1865. Assistant Surgeon J. H. Armsby, U. S. V., in charge of the latter, contributed a plaster

[1] A detailed history of the case will be found in *American Journal of Medical Sciences*, New Series, 1864, Vol. XLVII, p. 395, *Report of Cases of Hospital Gangrene treated in Douglas Hospital*, Washington, D. C., by WILLIAM THOMSON, M. D.

cast (*Spec.* 2552, *Sect.* I, A. M. M.) of the injured limb, represented in the annexed cut (FIG. 271), and reported the patient's discharge from service July 20, 1865, by reason of disability resulting from the wound. Examining Surgeon J. B. Chapin, of Canandaigua, N. Y., reported, July 2, 1869: "The disability had its origin in a gunshot wound of the upper third of the tibia. The bone was shattered, leaving the head uninjured. The operation of resection, by which four inches of the tibia was removed, was performed. The fibula is thrown out of line externally by the action of walking and the weight of the body, and a false joint exists below the knee joint. The limb requires a splint and bandage to be applied constantly for support, and in addition the pensioner requires the aid of a cane," etc. The Canandaigua Examining Board certified, September 4, 1877, to the following: "Leg shortened about two inches; false joint, large cicatrix along spine of tibia; upper end of fibula projecting. Leg curved outward." The pensioner was paid March 4, 1880.

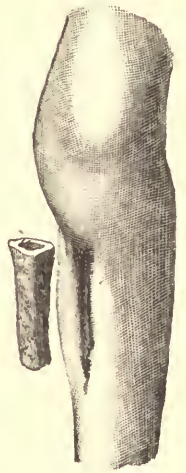

FIG. 271.—Left leg after excision of 4 inches of shaft of tibia. *Spec.* 2552. [From a cast.]

CASE 707.—Sergeant J. Measor, Co. C, 137th New York, aged 37 years, was wounded in the left leg, at Wauhatchie, October 29, 1863, and admitted to the field hospital of the 2d division, Twelfth Corps. Surgeon G. Perin, U. S. A., reported the injury as a "fracture of the tibia," for which excision was performed at the upper third by Surgeon A. K. Fifield, 29th Ohio. Assistant Surgeon H. T. Legler, U. S. V., reported that the wounded man entered the general hospital at Bridgeport three days after receiving the injury, and that he left for his home on furlough April 4, 1864. Acting Assistant Surgeon J. W. Robie reported that the patient was subsequently admitted to Ladies' Home Hospital, New York City, where a second operation for the removal of bone became necessary, by reason of necrosis, on August 22d. He was discharged from service April 5, 1865, and pensioned. From a description of the case by Dr. E. D. Hudson, of New York City, who supplied the pensioner with a surgical apparatus for the wounded limb, it appears that the total amount of bone removed comprised three and a half inches, the first operation consisting of the posterior and main part of the shaft of the tibia, while, at the second, the remaining anterior portion was removed by Acting Assistant Surgeon J. C. Stone. Examining Surgeon D. W. Hunt, of Fairmont, Minnesota, reported: "The wounded limb is much smaller than the other, the muscles being shrunken and somewhat shorter than the other. The deformity modifies his gait very much, causing an appearance of lameness." The pensioner was paid December 4, 1879.

In the next case six inches of the fractured fibula were excised, and the posterior tibial artery was successfully ligated for secondary hæmorrhage:

CASE 708.—Private J. Leichty, Co. F, 8th Pennsylvania Reserves, aged 21 years, received a shot fracture of the fibula of the left leg, at Spottsylvania, May 11, 1864. Surgeon L. W. Read, U. S. V., reported that he was admitted to the field hospital of the 3d division, Fifth Corps, where "resection was performed by Surgeon T. Jones, 8th Pennsylvania Reserves." Assistant Surgeon A. Ingram, U. S. A., contributed the following history: "The wounded man entered Judiciary Square Hospital, Washington, May 18th. About six inches of the injured fibula had been excised on the field. Secondary hæmorrhage occurred from the posterior tibial artery to the amount of thirty-two ounces, when the vessel was ligated in the wound. By June 14th the patient was progressing well. Cold-water dressings were used, and milk punch and a supporting treatment was administered." The patient was subsequently transferred to hospital at Alexandria, whence he was discharged from service January 11, 1865, and pensioned. Examining Surgeon J. McCullock, of Huntingdon, Pennsylvania, April 18, 1867, described the wound, and added that the "leg has sloughed largely and discharged a number of pieces of bone, the last one about three weeks ago. Since that time the wound has healed; tendons back of knee contracted; walks lame; wound painful," etc. Examiner A. B. Brumbaugh reported, in 1877, that, as a result of the resection, "The foot cannot be planted even, as it would turn outward from the want of fibular support, and he has to keep his shoe blocked up accordingly to support the foot. The toes of the left foot tend to turn downward, like hooks, from injury to the nerves and muscles. The leg is not quite but almost useless for all purposes of manual labor." The pensioner was paid March 4, 1880.

Of the one hundred and forty-eight survivors after primary excision in the bones of the leg nineteen submitted to subsequent operations, viz: fourteen[1] to amputation in the leg; one[2] to exarticulation at the knee; and four[3] to amputation in the thigh.

Fatal Cases of Primary Excision in the Continuity of the Leg.—The sixty-seven fatal cases of primary excision in the bones of the leg comprised thirty excisions in the shaft of the tibia, thirty-two in the shaft of the fibula, and five of both bones of the leg. Subse-

[1] In nine of the fourteen cases of amputations in the leg the operation was performed in the upper third, viz: Pt. S. B. Andrews, Co. F, 72d Penn., right leg, secondary operation; Pt. L. Arnold, Co. G, 143d Penn., right leg, intermediary operation; Lieut. Col. W. W. Dudley, 19th Indiana, right leg, intermediary operation; Corp'l W. H. Goldsmith, F, 2d New Hamp., left leg, secondary operation; Pt. D. A. Hatch, C, 2d Mass., right leg, secondary operation, *Spec.* 2155, A. M. M.; Corp'l C. McCarty, E, 1st N. Y., right leg, secondary operation; Pt. T. Powell, F, 6th U. S. C. T., left leg, secondary operation; Musician C. A. Runyan, F, 9th N. Y. H. A., left leg, secondary operation; Pt. P. O'Rourke, F, 7th N. Y. H. A., left leg, intermediary operation, *Specs.* 1502 and 3546, A. M. M. In five cases the operation of amputation was performed in the middle third, viz: Pt. T. Beirn, G, 60th Illinois, left leg, intermediary operation; Pt. J. R. Cowling, A, 62d Penn., right leg, secondary operation; Pt. P. Steif, K, 139th N. Y., right leg, intermediary operation; Pt. J. Koehler, I, 150th Penn., left leg, intermediary operation, *Specs.* 2404 and 3533, A. M. M.; Pt. J. J. Toomey, I, 29th Penn., left leg, intermediary operation, *Spec.* 3361, A. M. M. These cases will appear in the tables of amputations in the leg.

[2] Amputation at the knee joint was resorted to in the case of Pt. J. H. Pattee, Co. D, 26th Ohio (TABLE LVII, p. 409, No. 6).

[3] Two of the four cases of amputation in the thigh were done in the middle third, viz: Pt. S. Montgomery, I, 139th Penn., left thigh, secondary operation (TABLE XXXIX, p. 314, No. 63); Pt. W. Stoedale, D, 48th Indiana, right thigh, secondary operation (TABLE XXXIX, p. 314, No. 87); and two in the lower third, viz: Corp'l M. Dunn, H, 46th Penn., both thighs, primary operations, *Spec.* 3193 (CASE 448, p. 242, and TABLE XXXII, p. 248, Nos. 239, 240); Pt. P. Walsh, A, 69th N. Y., left thigh, intermediary operation (TABLE XXXVI, p. 296, No. 202).

quent amputation was performed in fourteen instances, three times in the leg,[1] twice at the knee joint,[2] eight times in the thigh,[3] and once in the leg with subsequent re-amputation in the thigh.[4] The patients were sixty-one Union and six Confederate soldiers. Pyæmia was noted in eight, gangrene in twelve, erysipelas in four, and hæmorrhage in fifteen instances.

FIG. 272.—Bones of right leg, with 2½ inches of tibia excised. *Spec.* 3337.

CASE 709.—Private N. Biehl, Co. I, 155th Pennsylvania, aged 27 years, received a shot fracture of the right tibia, at Petersburg, June 19, 1864. He was conveyed to the field hospital of the 1st division, Fifth Corps, where excision was performed but not recorded, and whence he was transferred to City Point and subsequently to Alexandria. Surgeon E. Bentley, U. S. V., who amputated the limb, reported the following history: "The patient was admitted to the Third Division Hospital June 28th. Exsection had been performed on June 21st, in the field, by Surgeon J. A. E. Read, 155th Pennsylvania, who removed two inches of the middle third of the tibia by a straight incision four inches in length. When admitted the lips of the wound were widely separated, having apparently never been brought together closely or supported except by straps and bandages. The incision remained open in its whole length, leaving a portion of the crest of each extremity exposed and uncovered of periosteum. The granulations were healthy and covered with laudable pus; but the leg and foot were badly swollen, particularly about the ankle, where the integument was œdematous and pitted deeply on pressure. Water dressings were applied to the wound and stimulants were given internally. On July 14th, gangrene appeared in the wound. Remedies used successfully in other cases signally failed in this. The disease extended along the medullary cavity of the bone and the muscles behind, seemingly bidding defiance to local applications and becoming very offensive. The patient sank very rapidly under the effects of the pain and poison, and the loss of blood from an artery opened by ulceration. On July 19th, amputation at the middle third of the thigh was performed by circular skin flaps. The patient was much prostrated at the time of the operation; had no appetite, great thirst, and dry tongue; face sunken and anxious; pulse quick and tremulous. Alcohol was applied to the stump, which was covered with a compress wet with the same. Whiskey and morphine was given internally. The next day gangrene attacked the stump, spreading rapidly on its face and extending three inches up the inner side of the thigh. The patient died on July 21, 1864, of exhaustion. The *post-mortem* examination, twenty-two hours after death, revealed extensive gangrene of the stump and mortification extending to the body." The bones of the wounded leg, showing the tibia to be dead for one inch on each side of the excision, were contributed by Dr. Bentley and are shown in the annexed cut (FIG. 272).

CASE 710.—Corporal P. Lovell, Co. C, 10th Missouri, aged 41 years, was wounded at Mission Ridge, November 25, 1863. He entered the field hospital of the 3d division, Fifteenth Corps, where Surgeon J. L. Prout, 26th Missouri, noted: "Fracture of leg and wound of right shoulder, resection of portion of tibia." Assistant Surgeon J. J. Whitney, 8th Wisconsin, reported the following history: "The patient was of previous good constitution, but asthmatic. He was severely wounded, the left tibia being fractured at the junction of the middle and lower third. Two and a half inches of bone were resected the evening following the injury. Up to the time of the patient's admission to the general field hospital at Chattanooga, December 20th, no attempts at repair had taken place, the wound granulating feebly and suppuration being profuse. On January 10, 1864, secondary hæmorrhage occurred from the posterior tibial at its superior portion; tissue of the calf infiltrated, and blood flowing from the posterior wound at the seat of the fracture. Up to this date the patient had been generally quiet and had had a good appetite; no diarrhœa, chills or fever. Assistant Surgeon R. Bartholow, U. S. A., in charge of the hospital, being called in consultation, it was determined to amputate below the knee, which operation was then immediately performed by him, at the junction of the upper and middle thirds, by the circular flap incision. During the operation the fibula was found to be fractured just below its articulation with the tibia, when a longitudinal incision was made and the upper fragment was smoothly excised. On January 15th, the stump was sloughing somewhat; discharges comparatively healthy, patient having no constitutional symptoms. On the following day there was a profuse hæmorrhage, the ligatures having sloughed away, and the patient losing about sixteen ounces of blood. The bleeding was controlled by the application of cold and pressure. The skin about the stump now assumed a puffy erysipelatous character; patches looking gangrenous; bone protruding and healthy looking; pulse 100 and feeble. The treatment up to this time had been decidedly supporting, such as quinine, wine, beef tea, and milk. On January 17th, another hæmorrhage occurring, I opened the wound down to the bleeding point and applied actual cautery, which instantly staunched the flow. The dead portions of tissue were all cut away and the stump was dressed with common solution of bromine. This treatment was continued until the 19th, when the artery opened again late in the evening, but the bleeding was controlled so soon that he lost only about four ounces; actual cautery was again employed. On January

[1] The three amputations in the leg were done in the upper third, viz., cases of: Pt. *J. S. Dewes*, H, 18th Virginia, primary operation; Capt. H. R. Schwerin, C, 119th New York, right leg, intermediary operation; Pt. R. Whistler, H, 49th Ohio, right leg, secondary operation.

[2] Amputation at the knee joint was performed in the cases of: Pt. F. Carroll, K, 45th Penn., right leg, intermediary operation (TABLE LVI, p. 406, No. 21); and Corp'l T. Sharp, I, 38th Illinois, right leg, secondary operation (TABLE LVII, p. 409, No. 23).

[3] Subsequent amputations in the thigh were performed in the cases of: Corp'l C. Jackson, G, 2d Michigan, left thigh, intermediary operation in upper third (TABLE XXXIV, p. 276, No. 91); Pt. J. H. Carpenter, E, 110th Ohio, left thigh, intermediary operation in middle third, *Spec.* 2759, A. M. M. (TABLE XXXV, p. 283, No. 241); Pt. N. Biehl, I, 155th Penn., right thigh, intermediary operation in middle third, *Spec.* 3337, A. M. M. (TABLE XXXV, p. 283, No. 223); Pt. N. H. Atwood, C, 6th Vermont, right thigh, intermediary operation in lower third (TABLE XXXVI, p. 296, No. 230); Pt. C. A. Eaton, K, 39th Mass., right thigh, intermediary operation in lower third (TABLE XXXVI, p. 298, No. 324); Pt. D. A. Johnson, E, 43d N. Y., right thigh, secondary operation in lower third (TABLE XL, p. 322, No. 148); Pt. J. Bader, F, 59th Illinois, left thigh, secondary operation in lower third (TABLE XL, p. 322, No. 181); Serg't L. Heath, D, 2d Michigan, right thigh, intermediary operation in lower third, *Spec.* 2867, A. M. M. (TABLE XXXVI, p. 299, No. 390).

[4] Case of Corp'l P. Lovell, Co. C, 10th Missouri, left thigh, secondary operation, *Spec.* 2108 (TABLE XL, p. 322, No. 160).

21st the patient was much the same; stump looking better; pulse 110 and full; appetite good; no pyæmic symptoms. Actual cautery was applied every third day, thus anticipating the occurrence of hæmorrhage. On January 28th, the outer portion of the stump was gangrenous and looked badly; patient now failing; slough cleansed and bromine applied with good effect. On January 31st, the artery gave away farther above, bleeding again profusely, when actual cautery and pressure were successfully employed; patient losing eight ounces of blood; very feeble; gangrene progressing. Hæmorrhage recurring on the morning of February 2d, I consulted with the other members of the faculty, when it was resolved to re-amputate, which was promptly done by Assistant Surgeon R. Bartholow by circular incision above the condyles of the femur. The operation was endured but indifferently well. Ether was solely employed in the production of anæsthesia. The patient did not rally, his stomach rejecting all food and stimulants; pulse 100 and very feeble ten hours after the operation. He died February 3, 1864." The specimen (No. 2108, *Surg. Sect.*), comprising the two lower thirds of the tibia and fibula and represented in the wood-cut (FIG. 273), was contributed by the operator.

FIG. 273.—Lower thirds of left tibia and fibula. *Spec.* 2108.

FIG. 274.—Upper half of right tibia. Two inches of shaft have been excised. *Spec.* 2867.

CASE 711.—Sergeant L. Heath, Co. D, 2d Michigan, aged 22 years, received a shot fracture of the right leg, before Petersburg, June 18, 1864. He was admitted to the field hospital of the 3d division, Ninth Corps, where excision was performed but not recorded. Assistant Surgeon A. Ingram, U. S. A., contributed the pathological specimen, shown in the annexed cut (FIG. 274), with the following report: "The patient entered Judiciary Square Hospital, Washington, July 1st, with a wound about the junction of the upper and middle thirds of the tibia. Resection of about two inches of the continuity of the bone was performed on the day of the injury. The tibia was somewhat shattered for about an inch above and below the points of resection. Amputation at the lower third of the thigh was performed in this hospital on July 7th, by Acting Assistant Surgeon J. H. Thompson, the condition of the injured parts and the constitutional state of the patient rendering the operation necessary. The circular method was chosen and ether was used as the anæsthetic. Tonics and stimulants were administered after the operation. Hæmorrhage to the amount of six ounces occurred from the femoral artery on July 12th, when the vessel was taken up in Scarpa's triangle. Death occurred from pyæmia July 28, 1864." The specimen (No. 2867, *Surg. Sect.*) consists of the upper half of the injured tibia and shows the extremities to be somewhat irregularly necrosed.

TABLE LXIII.

Summary of Two Hundred and Fifteen Primary Excisions in the Bones of the Leg for Shot Injury.

[Recoveries, 1—148; Deaths, 149—215.]

No.	NAME, MILITARY DESCRIPTION, AND AGE.	DATES.	OPERATIONS, OPERATORS, RESULT.	No.	NAME, MILITARY DESCRIPTION, AND AGE.	DATES.	OPERATIONS, OPERATORS, RESULT.
1	Adams, I. N., Pt., D, 110th Ohio, age 29.	April 2, 2, 1865.	Left; 5 inches lower part tibia excised; amputation leg April 12. Disch'd Sept. 11, '65; leg useful.	14	Carson, J. W., Pt., B, 7th Ohio, age 25.	June 18, 19, 1864.	Left; 4 inches of fibula. Discharged July 5, '65; leg disabled.
2	[1]*Allen*, ——, Major.	April 6, —, 1862.	Right; 6 inches fibula. Surgs. B. W. Avent and J. W. Thompson, C. S. A. 1866, walks well.	15	Chandler, N. W., Lieut., H. 109th New York, age 21.	June 17, 18, 1864.	Left; portion of upper third tibia excised. Surg. W. B. Fox, 8th Mich. Disc'd Nov. 5, '64; unable to walk without assistance.
3	Andrews, S. B., Pt., F, 72d Penn., age 28.	May 10, 10, 1864.	Right; 2½ inches tibia, middle third; amputation leg Sept. 27. Discharged Nov. 27, 1864.	16	Clark, G., Lieut. Col., 119th Penn., age 44.	April 2, 2, 1865.	Right; 3 inches upper third tibia excised. Must'd out June 19, '65.
4	Arnold, L., Pt., G, 143d Penn., age 20.	May 25, 25, 1864.	Right; tibia; amp leg May 29. Discharged June 17, 1865.	17	Clark, J., Pt., D, 26th Illinois, age 49.	Sept. 3, 3, 1864.	Left; 2½ inches of fibula excised. Ass't Surg. D. Hulderman, 46th Ohio. Disch'd June 29, 1865; can only walk with crutch.
5	Bain, T., Pt., G, 60th Illinois, age 34.	July 4, 4, 1864.	Left; 4 inches tibia, lower third. Surg. E. Batwell, 14th Mich. Gangrene; non-union. Aug. 1, amp. leg. Disch'd May 9, '65.	18	Coddington, R., Pt., C, 21st New Jersey, age 23.	May 3, 3, 1863.	Right; 4 inches fibula excised. Mustered out June 19, '63; limb useless. Died May 4, 1867.
6	*Bell, H. V.*, Pt., I, 5th Virginia.	July 2, 2, 1863.	Right; 3½ inches fibula, middle third. Recovery.	19	Collier, C., Pt., G, 4th Ohio.	May 3, 5, 1863.	Right; 5 inches mid. third tibia excised. Disch'd Mar. 31, '64; use of splint necessary.
7	Bennett, N., Corp'l, A, 7th Michigan.	Oct. 8, 8, 1864.	Left; middle third tibia excised. Disch'd July 18, 1865; permanently lame.	20	Collins, F., Pt., A, 184th New York, age 35.	Oct. 19, 19, 1864.	Left; 2 ins. fibula, middle, exc'd. Disch'd May 22, 1865.
8	*Bingham, J. M.*, Pt., K, 56th N. C., age 37.	Mar. 25, 25, 1865.	Right; mid. third tibia excised. Ass't Surg. E. M. Smyser, 48th Penn. Released Aug. 2, 1865.	21	Cooper, J., Pt., C, 10th N. Y. Artillery, age 25.	April 2, 2, 1865.	Left; 2 inches middle third tibia excised. A. Surg. O. S. Copeland, 10th N. Y. Artillery. Discharged July 19, 1865; partial anchylosed ankle joint.
9	Bovie, P. P., Pt., B, 129th Indiana.	July 4, 4, 1864.	Left; 1½ inch lower third fibula. Surg. C. D. Moore, 13th Ky. Disch'd May 29, 1865; partially anchylosed ankle.	22	Copeland, M., Pt., M, 1st Maine Cav., age 18.	Mar. 31, 31, 1865.	Right; upper third fibula excis'd. Disch'd July 19, 1865. 1867, bone discharged.
10	Bowers, G., Pt., B, 77th New York, age 31.	Sept. 19, 19, 1864.	Right; 5 inches lower half fibula excised. Surg. G. T. Stevens, 77th N. Y. Gang.; hæm.; lig. post. tibial. Disch'd June 5, '65.	23	Cowling, J. R., Pt., A, 62d Penn., age 21.	July 2, 3, 1863.	Right; 3 inches mid. third tibia excised. Surg. J. Kerr, 62d Penn. Mustered out July 13, 1864. Amp. leg Sept. 21, 1864.
11	*Brandon, J. C.*, Pt., Clayborne's Escort, age 19.	Nov. 30, Dec. 1, 1864.	Right; 4 inches mid. third tibia excised. Sent to Provost Marshal March 27, 1865.	24	Crawford, L. S., Pt., F, 126th Ohio, age 21.	Sept. 22, 22, 1864.	Left; 3 inches mid. third fibula excised. Disch'd Mar. 6, 1865.
12	Brown, W. C., Corp'l, K, 141st Penn., age 21.	Aug. 16, 17, 1864.	Right; portion of middle third of tibia; removal exfoliated bone. Disch'd June 27, '65; necrosis.	25	Croston, W., Pt., F, 1st Mass. H. Art., age 24.	Aug. 15, 15, 1864.	Right; portion of fibula. Discharged July 27, 1865.
13	Burton, G. W., Pt., E, 5th Wisconsin, age 20.	April 2, 2, 1865.	Left; middle third tibia (fracture and trephining of occipital). Discharged July 24, 1865; leg disabled.	26	Crow, E., Pt., C, 123d New York, age 20.	June 22, 22, 1864.	Left; 2 inches middle third fibula excis'd. Surg. J. Chapman, 123d N. Y. Disch'd March 27, 1865.
				27	Denny, M., Serg't, F, 70th Indiana, age 37.	July 20, 20, 1864.	Left; lower third fibula excised. Disch'd July 7, 1865.

No	Name, Military Description, and Age.	Dates.	Operations, Operators, Result.
28	Dickerson, C., Corp'l, C, 51st Indiana, age 25.	Dec. 4, 5, 1864.	Right; 2 inches fibula excised (also fracture left tibia). Mustered out Mar. 8, '65; paralysis.
29	*Dodds, W. P.*, Pt., D, 17th Miss., age 21.	July 2, 2, 1863.	Left; portion of fibula. Paroled November 12, 1863; union.
30	Driggs, J. A., Pt., E, 67th Ohio, age 22.	Oct. 27, 27, 1864.	Right; 2 inches mid. third tibia excised. Surg. A. C. Barlow, 62d Ohio. Disch'd May 16, '65; ligamentous union only.
31	Dudley, W. W., Lieut. Col., 19th Ind., age 22.	July 1, 3, 1863.	Right; 3 inches mid. third fibula excised. Surg. J. E. Ebersole, 19th Ind. Gang.; hæm. July 9, amp. leg. Disch'd April 9, '64.
32	Dunham, H., Pt., 1, 2d Ohio, age 23.	Dec. 31, 1862, Jan. 1, '63.	Right; most of mid. third of tibia excised. Disch'd August 3, '63; shortening 3 inches.
33	Dunn, M., Corp'l, H, 46th Penn., age 21.	May 25, —, 1864.	Left; head of fibula excised (also amp. right thigh). May 27, amp. left thigh; re-amp. right thigh. Disch'd August 17, 1865. Died October 23, 1877. *Spec.* 3193.
34	Farnsworth, R. R., Pt., C, 7th Mich. Cavalry, age 32.	July 3, 4, 1863.	Right; upper and middle thirds tibia. Aug. 6, excised. Disch'd July 1, 1864; bone diseased.
35	Ferguson, W. J., Pt., H, 81st Ohio, age 34.	July 22, 22, 1864.	Left; 4½ inches tibia, upper third, exc'd. Surg. W. C. Jacobs, 81st Ohio. Oct. 7, spiculæ removed. Disch'd May 12, 1865; caries.
36	Fitch, W. T., Col., 29th Ohio, age 40.	May 8, 8, 1864.	Right; 3 ins. tibia, middle, exc'd. Surg. A. K. Fifield, 29th Ohio. Resigned Oct. 13, 1864. 1870, bone not united.
37	Flynn, J. P., Pt., E, 56th Mass., age 34.	May 6, 6, 1864.	Left; 1 inch fibula, lower third, exc'd. Surg. J. Barber, 1st Penn. Reserves. Disch'd July 12, '65; ankle lame.
38	Frair, J. E., Pt., F, 9th N. Y. H. Art., age 19.	Oct. 19, 21, 1864.	Right; 4 inches mid. third fibula; necrosis. Disch'd May 31, 1865; requiring continuous bandaging.
39	Freeman, D. B., Pt., G, 10th Vermont, age 22.	Sept. 19, 21, 1864.	Left; 3 inches middle third fibula exc'd. A. Surg. W. G. Bryant, 122d Ohio. Disch'd May 31, '65.
40	French, G. W., Pt., A, 27th Mich., age 27.	June 3, 3, 1864.	Left; 3 inches upper third fibula excised. Surg. H. E. Smith, 27th Mich. Disch'd April 18, 1865.
41	Fuller, A., Pt., G, 109th New York, age 22.	July 30, 30, 1864.	Left; 3 ins. fibula, low. th'd, exc'd. Surg. W. C. Shurlock, 51st Penn. Disch'd May 16, '65; walks well.
42	Fyler, O. R., Lieut., I, 2d Conn. Artillery, age 25.	Sept. 19, 19, 1864.	Left; 3 inches middle third tibia excised. Surg. H. Plumb, 2d Conn. Art. Disch'd April 6, '65; deformity of tibia.
43	Gardner, C. J., Pt., B, 6th N. Hamp., age 32.	Oct. 1, 1, 1864.	Left; middle third fibula excised. Surg. S. Cooper, 6th N. Hamp. Disch'd June 19, 1865.
44	Gibbons, J., Corp'l, C, 90th Illinois, age 22.	Dec. 13, 15, 1864.	Right; 3 inches mid. third fibula exc'd. Surg. I. N. Barnes, 116th Ill. Mustered out June 5, 1865.
45	Gibbons, T., Pt., A, 125th New York.	June 16, 16, 1864.	Left; fibula, lower third, excised. Surg. P. E. Hubon, 28th Mass. Mustered out May 31, 1865.
46	Goldsmith, W. H., Corp'l, F, 2d New Hampshire, age 24.	June 9, 9, 1864.	Left; 4 inches middle third tibia excised. Surg. G. P. Greeley, 4th N. Hamp. May 15, '65, amp. leg. Disch'd Oct. 14, 1865.
47	Gould, D. M., Pt., D, 102d New York, age 21.	May 27, 27, 1864.	Left; 4 inches up. third tibia excised. Surg. C. H. Lord, 102d N. Y. Disch'd July 20, 1865; constant support required; false joint. *Spec.* 2552.
48	Graham, J., Pt., B, 74th Illinois.	June 21, 21, 1864.	Right; middle third tibia excised. Surg. W. P. Pierce, 88th Illinois. Disch'd June 6, 1865; necrosis.
49	*Green, F. F.*, Pt., B, 12th Georgia, age 21.	July 1, 3, 1863.	Left; lower portion of fibula excised. Paroled Nov. 12, 1863.
50	*Gurley, W. H.*, Pt., D, 4th N. Carolina, age 30.	July 3, 3, 1863.	Left; 3 inches middle third tibia excised. Exch'd Nov. 12, 1863.
51	Hall, J., Corp'l, A, 107th New York.	Mar. 19, 19, 1865.	Left; portion of fibula excised. Discharged July 15, 1865.
52	Hannoway, J., Pt., A, 69th N. Y., age 39.	Aug. 15, 15, 1864.	Right; ½ inch fibula, lower third, excised. Surg. G. Chaddock, 7th Mich. Disch'd June 23, '65.
53	Harris, H. A., Lieut., B, 16th Mass., age 22.	July 2, —, 1863.	Left; 4 inches fibula, upper third. Disch'd Dec. 19, 1863. Died June 24, 1865.
54	Hatch, D. A., Pt., C, 2d Massachusetts, age 25.	July 3, 5, 1863.	Right; 2 inches mid. third tibia excised. Surg. W. H. Heath, 2d Mass. Amp. leg Dec. 16. Discharged April 2, '64. *Spec.* 2155.
55	Hendley, J. B., Pt., D, 46th Ohio.	June 27, 27, 1864.	Left; 3½ inches mid. third fibula exc'd. A. Surg. D. Halderman, 46th Ohio. Disch'd Apr. 10, '65.
56	Henry, C., Pt., I, 29th Pennsylvania, age 19.	May 15, 15, 1864.	Right; 3 ins. low. th'd tibia exc'd. Surg. G. P. Oliver, 111th Penn. Disch'd June 29, 1865; necrosed bone removed; deformity.
57	Hersh, Z. E., Capt., B, 87th Penn., age 24.	April 2, 2, 1865.	Left; 3 inches of fibula excised. Mustered out June 29, 1865.
58	Hinsdale, A., Pt., E, 137th N. York, age 20.	July 2, 2, 1863.	Left; 4 inches lower third tibia excised. Surg. H. E. Goodman, 28th Penn. Disch'd May 15, '65; ankle joint anchy.; deformity.
59	Hogan, J., Pt., F, 127th Pennsylvania, age 41.	Dec. 13, 14, 1862.	Right; 6 ins. middle tibia exc'd. Surg. J. P. Prince, 36th Mass. Exfol. of sequestra. Mustered out May 29, 1863; 8 ins. separation; deformity. Died May 14, 1877. *Spec.* 2237.
60	Hollcroft, W., Serg't, L, 2d N. Y. Cav., age 24.	April 8, 8, 1865.	Left; 3 inches middle third fibula excised. Disch'd July 3, 1865.
61	Hope, J., Pt., D, 51st New York.	July 30, 30, 1864.	Left; portion of tibia excised. Mustered out May 19, 1865.
62	Hoy, M., Pt., B, 61st New York.	May 3, 3, 1863.	Left; portion of fibula excised. Surg. T. C. Wallace, 61st N. Y. Recovery July 14, 1863.
63	Hurst, W. L., Corp'l, E, 115th Illinois.	Sept. 20, 20, 1863.	Left; 3 inches middle third fibula excised. Disch'd Aug. 3, 1864.
64	Ibach, F., Pt., A, 93d Pennsylvania, age 16.	May 5, 5, 1864.	Left; 2 inches middle third tibia excised. Disch'd Oct. 6, 1864; permanently disabled.
65	Johnson, J. F., Serg't, H, 9th Indiana, age 26.	June 20, 20, 1864.	Left; 4 ins. middle tibia excised. Disch'd Nov. 4, 1864; shortening 2 ins. and firm union.
66	*Johnson, S. P.*, Pt., B, 13th South Carolina, age 29.	July 28, 28, 1864.	Right; portion of tibia excised. Surg. D. W. Maull, 1st Del. Sent to prison Feb. 5, 1865.
67	Jones, S. W., Corp'l, A, 4th Delaware, age 29.	Oct. 8, 8, 1864.	Left; 2 inches fibula excised; lig. post. tibial and peroneal arteries. Surg. A. A. White, 8th Maryland. Disch'd June 22, 1865
68	Keech, H., Pt., K, 2d N. York Cavalry.	May 2, 3, 1864.	Left; 2 inches fibula, up. third, excised. Ass't Surg. C. H. Andrus, 128th N. Y. Furloughed June 19, 1864.
69	King, J. R., Serg't, H, 6th Maryland, age 21.	May 5, 6, 1864.	R't; 2 ins. mid. third fibula exc'd. Ass't Surg. R. L. Disbrow, 14th N. J. Disch'd May 18, 1865.
70	Koehler, J., Pt., I, 150th Pennsylvania, age 36.	May 5, 5, 1864.	Left; 4 ins. low. third fibula exc'd. Surg. W. T. Humphrey, 149th Penn. May 29, amp. leg. Disc'd April 19, '65. *Specs.* 2404, 3533.
71	Lamb, J. M., Pt., A, 58th Mass., age 22.	June 18, 18, 1864.	Right; 2 inches upper third fibula excised. Disch'd July 31, 1865; wears bandage.
72	Lawcock, T., Pt., K, 151st New York, age 31.	Oct. 19, 19, 1864.	Left; 2 ins. low. third fibula exc'd; caries. Disch'd June 12, 1865; ankle deformed.
73	Leichty, J., Pt., F, 8th Pennsylvania, age 21.	May 11, 11, 1864.	Left; 6 ins. mid. third fibula exc'd. Surg. T. Jones, 8th Penn. Res. Hæm., 32 oz.; lig. posterior tibial artery. Disch'd Jan. 11, 1865; bone discharged, 1867.
74	Lewis, J., Pt., G, 12th Mass., age 19.	May 30, 30, 1864.	Right; 3 inches mid. third fibula exc'd. Surg. W. H. W. Hinds, 12th Mass. Disch'd March 8, '65; regeneration of bone.
75	Lisle, J. D., Pt., C, 1st Maryland.	July 3, 4, 1863.	Left; portion of tibia exc'd. Surg. A. Chapel, U. S. V. Removal of fragments. Disch'd May 14, '64. *Spec.* 1655.
76	Lyon, C., Pt., D, 190th Pennsylvania, age 25.	May 12, 12, 1864.	Left; 1½ inch up. third tibia exc'd. Surg. B. Rohrer, 10th Penn. Res. Disch'd January 16, 1865; one inch shortening; deformity.
77	Mattern, L., Pt., F, 184th Pennsylvania, age 19.	May 30, 30, 1864.	Left; 4 inches middle third fibula excised. Surg. M. Rizer, 72d Penn. Disch'd May 27, 1865.
78	Mayes, J. H., Corp'l, F, 6th Ky. Cavalry.	Mar. 25, 25, 1863.	Right; 5 inches mid. tibia exc'd. Disch'd Sept. 16, 1863.
79	McCandless, A., Corp'l, K, 8th Ohio Cavalry, age 35.	Sept. 3, 6, 1864.	Left; 6 inches middle tibia exc'd. Discharged June 28, 1865; limb shortened 2 inches. Died Feb. 18, 1877; phthisis.

176	Herzog, F., Pt., C, 83d New York, age 29.	May 12, 12, 1864.	Right; 3 ins. fibula exc'd. Died May 30, 1864; exhaustion.
177	Hiney, W. H., Lieut., C, 50th Pennsylvania.	June 1, 1, 1864.	Right; 3 inches upper third fibula excised. Died July 8, 1864.
178	Hitchings, W., Pt., H, 8th Illinois.	April 9, 9, 1865.	Left; middle third fibula excised. Died April 17, 1865; gangrene.
179	Hughes, N., Pt., M, 3d Artillery.	Nov. 16, —, 1863.	Right; portion of tibia excised. Died December 18, 1863.
180	Jackson, C., Corp'l, G, 2d Michigan.	June 25, 25, 1864.	Left; partial excision of fibula. Surg. A. F. Whelan, 1st Mich. S. S. June 28, '64, amp. thigh. Died July 2, 1864.
181	Jackson, W., Pt., E, 97th New York, age 34.	May 11, 11, 1864.	Left; 4 inches middle third fibula exc'd. Surg. W. B. Chambers, 97th N. Y. Died June 1, 1864.
182	*Jamison, B. A.*, Pt., A, 21st Virginia, age 21.	July 3, 6, 1863.	Left; lower third tibia excised. Surg. J. A. Wolf, 29th Penn. Died July 18, 1863; tetanus.
183	Johnson, D. A., Pt., E, 43d New York, age 37.	Nov. 7, 7, 1863.	Right; portion of tibia excised; non-union. July 2, 1864, amp. thigh. Died August 6, 1864.
184	*Lancaster, W. B.*, Pt., B, 66th N. C., age 20.	June 18, 18, 1864.	Right; middle third tibia exc'd; gangrene. Died July 16, 1864.
185	*Lay, T. S.*, Pt., D, 53d Georgia, age 21.	Mar. 25, 25, 1865.	Left; head of fibula and part of tibia exc'd. Died April 21, '65.
186	Lemon, T. A., Corp'l, A, 61st Pennsylvania.	May 11, 11, 1864.	Left; 8 inches tibia excised. Died May 16, 1864.
187	Lohser, A., Pt., I, 24th Michigan, age 20.	May 25, 25, 1864.	Left; 3½ inches mid third fibula excised; also wound of right ankle. Died June 17, 1864.
188	Lovell, P., Corp'l, C, 10th Missouri, age 41.	Nov. 25, 25, 1863.	Left; 2½ inches lower third tibia exc'd. Jan. 10, '64, hæm. from post. tib. art.; amp. leg; slough.; hæm.; gang. Feb 2, amp. thigh. Died Feb. 3, 1864. *Spec.* 2108.
189	Mann, A. A., Corp'l, A, 16th Maine.	April 1, 1, 1865.	Right; middle third tibia exc'd. Died April 24, 1865.
190	Martz, S. V., Pt., I, 87th Pennsylvania.	May 18, 18, 1864.	Right; upper third fibula exc'd. Died June 4, 1864.
191	[1] McIntyre, A., Corp'l, D, 6th New York Heavy Artillery, age 37.	June 22, 23, 1864.	Left; 2 inches upper third fibula exc'd. Aug. 5, parench.; hæm. Died Aug. 10, 1864; pyæmia.
192	Meade, L., Pt., B, 2d N. York M. R., age 17.	June 18, 18, 1864.	Right; middle third tibia exc'd. Died July 17, 1864.
193	*Munn, J.*, Pt., E, 15th Alabama, age 32.	Oct. 7, 7, 1864.	R't; 3½ ins. mid. th'd tibia exc'd. Died July 9, '65; chr. diarrhœa.
194	Norman, C. H., Pt., K, 8th Maryland, age 20.	May 8, 8, 1864.	Left; portion of fibula excised. Died May 22, '64; hæmorrhage.
195	Rader, J., Pt., F, 59th Illinois, age 21.	Aug. 19, 19, 1864.	Left; 4½ inches middle third tibia exc'd. Dec. 7, '64, amp. thigh; gang. Died Jan. 4, '65; exhaus.
196	Reed, N. H., Pt., H, 30th Iowa.	June 15, 15, 1864.	Right; middle third tibia exc'd. Surg. B. A. Bond, 27th Missouri. Died July 10, 1864.
197	Rice, H., Corp'l, C, 36th Massachusetts.	May 25, —, 1864.	Right; head of fibula excised. Died June 1, 1864, of wound.
198	Rice, W., Pt., B, 14th Kentucky, age 29.	June 22, 22, 1864.	Right; 3 inches mid. third fibula excised. Surg. J. W. Lawton, U. S. V. Died Sept. 22, 1864.
199	Robbins, J. A., Capt., G, 129th Indiana.	June 29, 29, 1864.	Left; 2½ inches upper third fibula, including the head, excised. Surg. S. K. Crawford, 50th Ohio. Died July 24, 1864.
200	Root, W. R., Pt., E, 7th N. Y. H'vy Artillery.	June 3, 3, 1864.	——; portion of fibula excised. Surg. G. L. Potter, 145th Penn. Died June 9, 1864.
201	Rutledge, T., Lieut., G, 33d Missouri.	Dec. 15, 15, 1864.	Left; 2 inches middle third fibula excised. Surg. A. T. Bartlett, 33d Mo. Dec. 26, hæm., 32 oz. Died Dec. 28, 1864. *Spec.* 6634.
202	Sanders, G. W., Corp'l, K, 26th Ohio.	Sept. 19, 21, 1863.	Left; 2 inches lower third tibia excised. Died Oct. 22, 1863.
203	Schwerin, H. R., Capt., C, 119th New York.	May 2, 5, 1863.	Right (May 3, spicula and bal rem.); exc. in mid. third. Surg J. D. Hewett, 119th N. Y. May 9, amp. of leg. Died May 10, '63.
204	Sharpe, T., Corp'l, I, 38th Illinois, age 30.	Feb. 6, 7, 1864.	Right; por. of tibia exc'd. Surg. J. Y. Finley, 2d Ky. Cav. April 5, amp. knee joint. Died June 23, 1864; erysipelas.
205	Smith, J., Pt., I, 111th Pennsylvania.	July 20, 20, 1864.	Right; portion of fibula excised. Died July 21, 1864.
206	Smith, J., Pt., F, 17th Vermont, age 40.	June 17, 17, 1864.	Right; portion of fibula excised. Died July 6, 1864.
207	Springer, J. M., Chaplain, 3d Wis., age 37.	May 15, 15, 1864.	Right; 2½ inches mid. third tibia exc'd. Died May 22, '64; pyæm.
208	Thompson, W. B., Pt., K, 124th Ohio, age 19.	Dec. 17, 18, 1864.	Right; 3 inches excised. A. A. Surg. L. Sinclair. Died Feb. 2, 1865; gangrene.
209	*Utzey, G. C.*, Pt., G, 4th South Carolina Cav.	May 29, 30, 1864.	——; 5 inches of tibia excised. Surg. C. B. Gibson, C. S. A. Died June 24, 1864.
210	Walton, J., Corp'l, G, 20th Ohio, age 28.	July 27, —, 1864.	Left; port. of fibula exc'd. Died Sept. 26, 1864; dysentery.
211	Whistler, R., Pt., H, 49th Ohio.	June 2, 2, 1864.	Right; portion of tibia excised. July 5, leg amputated. Died July 14, 1864; pyæmia.
212	Williams, J. S., Pt., F, 127th New York, age 35.	Nov. 30. Dec. 2, '64.	Left; 4 inches of fibula excised. A. A. Surg. H. Leaman. Gangrene. Died Dec. 4, 1864.
213	Willingmire, S., Pt., C, 29th Pennsylvania.	May 25, 25, 1864.	Right; portion of tibia excised. Surg. G. P. Oliver, 111th Penn. Died June 17, 1864.
214	Wilson, J. M., Pt., D, 2d U. S. Sharpshooters.	May 5, 5, 1864	——; portion of upper third tibia excised. Died May 29, 1864.
215	Woodward, E. F., Pt., I, 53d Pennsylvania.	Dec. 13, 13, 1862.	Left; part of tibia and radius excised. Died Jan. 6, 1863.

[1] LIDELL (J. A.). *Resection of Fibula in Continuity for Gunshot Fracture, etc.*, in *United States Sanitary Commission Memoirs*, New York, 1870. Surgical Volume I, p. 530.

Of the two hundred and fifteen primary excisions in the continuity of the leg, forty-two with twelve deaths were in the upper, eighty-four with twenty-one deaths in the middle, forty-six with eight deaths were in the lower third of the leg, and in forty-three instances with twenty-six deaths the seat of the operation was not indicated.

Intermediary Excisions in the Continuity of the Bones of the Leg.—Eighty-seven excisions in the leg were intermediary operations; of these twenty-nine proved fatal, a mortality rate of 33.3 per cent. Portions of the tibia were excised in thirty-three, of the fibula in forty-six, and of both bones in seven instances, and in one case this point was not recorded.

Recoveries after Intermediary Excisions in the Continuity of the Bones of the Leg. The fifty-eight successful intermediary operations were performed on fifty-one Union and seven Confederate soldiers. One, an officer, is still (November, 1880) in active service, another has been placed on the retired list, and forty-nine became pensioners. Of the latter, five have died since the date of their discharge—two from debility, one from phthisis, and two from causes not recorded. Four patients submitted to subsequent operations—one to amputation in the leg[1] and three to ablation in the thigh.[2]

CASE 712.—Colonel H. A. Morrow, 24th Michigan, aged 33 years, received a shot fracture of the upper third of the fibula of the right leg, at the Wilderness, May 6, 1864. Five days after being wounded he entered the Seminary Hospital, Georgetown, where his injured limb was operated upon by Surgeon H. W. Ducachet, U. S. V., who reported the following: "When admitted the patient had no appetite and was feverish, very nervous and irritable, complaining of every noise. The wounded leg was very much swollen, painful, and discharging an unhealthy sanious pus. Resection of three inches of the upper third of the fibula was performed on May 11th, chloroform being used. The patient suffered intensely for twenty-four hours after the operation, when he began to improve. There were no unfavorable symptoms afterwards. Simple dressings were applied. The patient left the hospital on leave of absence July 1, 1864." Colonel Morrow subsequently returned to the field and again held active commands. He was mustered out of the Volunteer Service after the close of the war in 1865, and recommissioned in the 36th regiment of Infantry of the Regular Army in the following year, since when he has been promoted to Colonel of the 21st Infantry.

CASE 713.—Private G. Fuller, Co. H, 19th Maine, age 18 years, was wounded in the left leg, at Ream's Station, August 25, 1864, and entered Emory Hospital, Washington, three days afterwards. Acting Assistant Surgeon J. M. Downs forwarded the specimen (FIG. 275), with the following description of the injury: "The wound was produced by a musket ball, which passed through the leg near the ankle, shattering the lower third of the fibula in its course. Upon examination the operation of excision was thought advisable, and was performed, on August 29th, by Surgeon N. R. Moseley, U. S. V., who removed two and a half inches of the fibula near the ankle joint through an incision three and a half inches long. Ether and chloroform constituted the anæsthetic." The patient was subsequently transferred to Webster Hospital, Manchester, and on May 27, 1865, he was mustered out of service and pensioned. Various examining surgeons certified to the injury and operation, and Dr. C. B. Pearson, of Spring Green, Wisconsin, February 5, 1873, added: "The wound is healed, but the muscle has grown fast to the tibia so as to destroy action of the tendons," etc. Subsequent examiners corroborate the previous reports. The pensioner was paid December 4, 1879.

FIG. 275.—Two and a half inches of fibula excised. *Spec.* 1910.

CASE 714.—Private W. H. Curtin, Co. H, 23d Massachusetts, aged 20 years, was severely wounded in the left leg, at Whitehall, December 15, 1862. Surgeon C. A. Cowgill, U. S. V., reported: "The wounded man was admitted to Academy Hospital, New Berne, five days after receiving the injury. The fibula was badly comminuted and shattered. On December 26th, I excised six and a half inches of the bone, including the finely comminuted portion. The patient recovered pleasantly and has gone home on furlough, able to walk comfortably." He subsequently entered Foster Hospital, where he was discharged May 28, 1863. Examining Surgeon W. C. Robinson, of Portland, October 10, 1863, described the injury and reported: "A large cicatrix nearly the whole length of the leg, showing the nature of the operation. It appears that nature is in a measure restoring the bone. A large ulcer still exists at the point where the ball entered the leg. He has walked with a crutch until recently; is now able to walk with a cane." Several months after being discharged the man re-enlisted in the Veteran Reserve Corps, whence he was ultimately mustered out November 16, 1865, and pensioned. The Portland Examining Board reported, September 4, 1873, that "the nerves were injured so that the foot is greatly impaired in its motions." At a subsequent examination it was stated that "the tendo-achillis is contracted, so that there is but little antero-

FIG. 276.—Six and a half inches of fibula excised. *Spec.* 1326.

[1] Case of Private D. P. Griswold, Co. C, 76th New York, right leg, secondary amputation in the middle third.

[2] Cases of Pt. W. H. Burdick, Co. B, 82d Pennsylvania, right thigh, secondary operation in lower third (TABLE XL, p. 320, No. 17); Pt. I. A. Angell, Co. D, 1st Wisconsin Cavalry, right thigh, secondary amputation in lower third (TABLE XL, p. 320, No. 2); Pt. E. A. Bennett, Co. F, 44th New York, left thigh, secondary amputation in lower third (TABLE XL, p. 320, No. 7).

posterior motion of the ankle joint. The leg is atrophied and the parts bound down by the indurated cicatrix." The pensioner was paid December 4, 1879. The specimen represented in the wood-cut (FIG. 276) was contributed by the operator.

Fatal Cases of Intermediary Excisions in the Bones of the Leg.—The twenty-nine operations of this group were performed on Union soldiers. Pyæmia was noted in eleven, gangrene in eight, and erysipelas in one case. Subsequently, amputation in the leg was performed in one,[1] exarticulation at the knee in one,[2] and amputation through the thigh in five instances.[3] Reports of *post-mortem* examinations were received in five instances.

FIG. 277.—Four ins. of tibia, with fragment of ball, excis'd. *Spec.* 1307.

CASE 715.—Private H. M. Grimes, Co. C, 116th New York, aged 24 years, was wounded at Port Hudson, May 27, 1863. Surgeon C. B. Hutchins, 116th New York, reported his admission to the field hospital of the 1st division, Nineteenth Corps, with "shot wound of leg; severe." Assistant Surgeon P. S. Conner, U. S. A., who operated in the case and contributed the pathological specimens (FIGS. 277, 278), reported the following description of the injury and its results: "The man was wounded in the left leg by a minié ball, which was found to have struck the tibia anteriorly, causing compound comminuted fracture. He was admitted into University Hospital, New Orleans, May 30th, where, a few days later, several loose fragments of bone having been removed and the extent of the injury determined, the entire fractured portion was resected, amounting to nearly five inches of the tibia, and including the shaft to within less than an inch from the ankle joint. The ball was found to be wedged in among the fragments and the fibula uninjured. The case progressed very favorably until early in July, when diarrhœa came on, which caused the patient's death August 14, 1863. The bones of the injured leg (FIG. 278) indicate the extent of the reparative process, and the probabilities that the man would eventually have had a serviceable leg had he lived." The extremity of the lower fragment is carious, a spur from the upper fragment projecting three inches downward, and the face of the fibula is involved in callus.

FIG. 278.—Bones of the left leg, with four and a half inches of tibia excis'd. *Spec.* 2956.

CASE 716.—Private H. Mink, Co. H, 4th New York Heavy Artillery, aged 20 years, was wounded at Petersburg, April 2, 1865, and was conveyed to City Point two days afterwards. Acting Staff Surgeon J. Aiken recorded his admission to the Depot Hospital of the Second Corps with "compound fracture of left leg." On April 15th the wounded man was transferred to the First Division Hospital, Annapolis, where the injured limb was operated on by Surgeon B. A. Vanderkieft, U. S. V., who reported as follows: "The wound was produced by a minié ball, causing a compound comminuted fracture of the tibia and oblique fracture of the fibula at the middle third of the leg. Resection was performed on April 17th, removing a longitudinal portion of the fibula and parts of the upper and middle thirds of the tibia, one being five inches in length, two others one and a half inches each, and three smaller pieces. Very little inflammation existed at the time of the operation, and the patient was in good condition. Chloroform constituted the anæsthetic. Oakum dressings were applied and quill sutures used as means of partial coaptation of the flap. Purulent accumulations were removed by the syringe. Eight ounces of wine were given daily. Progress was favorable." Three weeks after the date of the operation the patient was transferred to the Second Division Hospital, Annapolis, where he died of exhaustion, May 11, 1865. Surgeon G. S. Palmer, U. S. V., in charge of the latter hospital, reported that the patient when admitted was in a moribund condition, also that the wound was in an unhealthy state and filled with maggots. The excised bone, shown in the wood-cut (FIG. 279), was contributed by the operator.

FIG. 279.—Six inches of left tibia excised. *Spec.* 4101.

CASE 717.—Corporal W. N. Esworthy, Co. E, 1st Pennsylvania Cavalry, aged 24 years, was wounded in the left leg, at White House Landing, June 21, 1864, and admitted to Carver Hospital, Washington, two days afterwards. Surgeon O. A. Judson, U. S. V., reported: "The missile, supposed to be a conoidal ball, entered the leg anteriorly about three inches below the knee joint, passed backward and outward, making its exit posteriorly and producing a compound comminuted fracture of the upper third of the tibia. Supporting treatment was adopted and simple dressings applied. Erysipelas attacked the wound on June 27th, but yielded readily to an application of solution of copperas. By July 1st no erysipelatous symptoms were present; constitutional state of patient good; wound secreting laudable pus in large quantity. On July 6th, the patient was anæsthetized and excision of about five inches of the upper third of the shaft of the tibia, by means of the chain saw, was performed by Acting Assistant Surgeon O. P. Sweet, making a straight incision over the crest of the tibia. The wound was then filled with scraped lint, cold-water dressings were applied, and stimulants given freely. The patient appeared to be doing quite well up to July 18th, the wound filling with healthy granulations and secreting laudable pus. For ten days previous, however, he had anorexia, and this morning he had a very severe chill. A recurrence of chills followed every morning and sometimes two or three times during the day, and these were followed by other pyæmic symptoms, the integuments assuming a deep icteric tinge; pulse rapid; slight cough;

FIG. 280.—Five ins. of left tibia exc'd. *Spec.* 2940.

[1] Case of Private A. E. Luther, Co. E, 3d Massachusetts Cavalry, left leg, intermediary operation at junction of upper and middle thirds.

[2] Case of Private S. M. Grainger, Co. A, 38th Indiana, left leg, secondary operation (TABLE LVII, page 469, No. 19).

[3] Cases of Pt. H. Conrad, I, 24th Mich., left thigh, intermediary operation in middle third, *Spec.* 3053 (TABLE XXXV, p. 283, No. 253); Pt. A. Allen, H, 5th U. S. Artillery, intermediary operation, lower third (TABLE XXXVI, p. 296, No. 223); Corp'l E. Gay, H, 18th Wisconsin, intermediary operation in lower third (TABLE XXXVI, p. 298, No. 357). Pt. M. Gilmore, D, 54th Mass., left thigh, intermediary operation in lower third (TABLE XXXVI, p. 298, No. 365); Pt. J. Bloomer, K, 170th N. Y., right thigh, intermediary operation in lower third, *Specs.* 3250, 3269, A. M. M. (TABLE XXXVI, p. 297, No. 246).

anorexia continuing. The treatment, decidedly stimulating and tonic, was continued. The symptoms continued in a more aggravated form and the patient steadily sank, the whole surface of his body being of a deep yellow color. He died on July 23, 1864. At the autopsy a large number of metastatic abscesses were found in both lungs; liver enlarged; spleen also enlarged, dark colored, and soft. A purulent offensive fluid mixed with lymph was shown in the left pleural cavity, and a large disintegrated clot in the femoral vein." The excised bone, contributed by Surgeon Judson and exhibiting superficial necrosis, is represented in the wood-cut (FIG. 280).

TABLE LXIV.

Summary of Eighty-seven Intermediary Excisions in the Bones of the Leg for Shot Injury.

[Recoveries, 1–58; Deaths, 59–87.]

No.	NAME, MILITARY DESCRIPTION, AND AGE.	DATES.	OPERATIONS, OPERATORS, RESULT.
1	Angell, I. A., Pt., D, 1st Wisconsin Cav'ry, age 23.	July 23, Aug. 1, 1864.	Right; gang.; 7 inches mid. third tibia excised. A. A. Surg. J. C. Thorpe. Sept. —, hæm.; 18th, amp. thigh. Disch'd Jan. 7,'65. Re-amp. June 16,'65. *Spec.* 5549.
2	Bennett, E. A., Pt., F, 44th N. York, age 41.	May 22, 31, 1864.	Left; middle third fibula excised. A.A. Surg. R. Ottman. Disch'd Oct. 11, '64. Amputation thigh March 2, 1869; re-amputation.
3	*Boger, G. C.*, Pt., H, 2d North Carolina, age 26.	Sept. 19, 25, 1864.	Left; 2 ins. in length, ¾ inch in depth of upper third tibia exc'd. Surgeon A. Atkinson, C. S. A. To prison Feb. 16, 1865.
4	Burdick, W. H., Pt., B, 82d Pennsylvania, age 24.	April 6, 13, 1865.	Right; 2 inches middle third tibia excised. Disch'd Oct. 12, 1865. Amp. thigh March 27, 1866.
5	Burke, J. C., Pt., H, 78th New York, age 20.	May 3, 18, 1863.	Right; 2 ins. mid. th'd tibia exc'd. Disch'd March 18, '64; caries.
6	Carse, G. B., Capt., C, 40th New York.	May 2, 30, 1863.	Right; 3 ins. fibula exc'd. Disc'd Dec. 15, 1863; slight shortening.
7	Casper, J. M., Corp'l, K, 7th Wisconsin, age 21.	May 23, June 13, 1864.	Right; partial excision of upper third fibula. A. A. Surg. P. C. Porter. Disch'd Mar. 24, 1865; partial paralysis foot.
8	Charles, R Y., Corp'l, G, 1st New York Drag's, age 22.	June 1, 15, 1864.	Left; 3 ins. mid. third tibia exc'd. Surg. R. B. Bontecou, U. S. V. Disch'd May 6, 1865; necrosis; shortening.
9	Collins, O., Pt., D, 151st New York, age 32.	Nov. 27, Dec. 9, 1863.	Left; 3 inches lower third fibula exc'd. Surg. E. Bentley, U.S.V. Ligation post. tibial art.; hæm. Disch'd Feb. 25, 1865.
10	Coyle, M., Pt., B, 81st Pennsylvania, age 23.	June 3, 15, 1864.	Right; 3 inches mid. third fibula exc'd. Surg. E. Bentley, U.S.V. Disch'd Oct. 3, 1865. Died Jan. 27, '76; debility, result of w'nd.
11	Crowley, J., Pt., E, 5th New York, age 25.	Sept. 29, Oct. 20, 1862.	Right; head and 3 ins. up. third fibula excised. Disch'd Nov. 22, 1862. Bone diseased. Died July 10, 1871.
12	Curtin, M. H., Pt., H, 23d Massachusetts, age 20.	Dec. 15, 26, 1862.	Left; 6½ inches fibula excised. Surgeon C. A. Cowgill, U. S.V. Disch'd May 28,'63. *Spec.* 1326.
13	Farran, J., Lieut., I, 1st Kentucky, age 25.	Dec.31,'62. Jan.5,'63.	Right; large portion mid. third tibia excised; fibula exfoliated. Disch'd June 18,'64; short. 1½ in.; deformity.
14	Fellows, J., Corp'l, D, 100th Illinois, age 24.	Sept. 19, 24, 1863.	Left; 3 inches middle third tibia excised. Disch'd Aug. 11, 1864; caries; shortening.
15	Fuller, G., Pt., H, 19th Maine, age 18.	Aug. 25, 29, 1864.	Left; 2½ inches lower third fibula excised. Surg. N. R. Moseley, U. S. V. Disch'd May 27, 1865. *Spec.* 1910.
16	Griffin, D. O., Pt., K, 17th Illinois, age 24.	April 6, —, 1862.	Left; 1½ inch lower third tibia excised Disch'd Oct. 15, 1862: toes and heel contracted.
17	Gould, J. A., Pt., H, 11th New Hamp., age 39.	Sept. 30, Oct. 9, 1864.	Left; 3 ins. low. third fibula exc'd. Surg. G. L. Pancoast, U. S. V. Gangrene. Disch'd Feb. 6, '65.
18	Green, W. C., Lieut., H, 37th New York, age 22.	June 1, 20, 1862.	Left; middle third fibula excised. Disch'd Sept. 13, 1862: bone united; ½ inch shortening.
19	Griswold, D. P., Pt., C, 76th N. York, age 19.	July 1, 5, 1863.	Right; portion of mid. third tibia excised. Disch'd Sept. 23, 1864. May 11, 1869, amputation leg.
20	Harvey, G., Pt., D, 63d Pennsylvania, age 24.	May 3, 12, 1863.	Right; 2 ins. lower third fibula excised. May 21, hæm., 12 oz. Disch'd Jan. 22, 1864.
21	Hayward, R., Pt., E, Knapp's Penn. Bat'ry, age 24.	Oct. 29, Nov. 12, 1863.	Right; upper third —— excised. Surg. I. Moses, U. S.V. Disch'd August 13, '64; union; deformity; shortening.
22	Herrald, S., Pt., H, 2d Kentucky Cavalry.	Sept. 19, 29, 1863.	Right; middle third tibia exc'd. Surg. I. Moses, U. S.V. Disch'd Nov. 12, 1864; reproduction of bone. *Spec.* 2148.
23	House, T. J., Pt., K, 16th Illinois, age 22.	Sept. 30, Oct. 15, 1863.	Right: head of fibula and part of shaft excised. Duty Nov. 14, 1863. Died Dec. 26, 1866.
24	Hough, S. R., Serg't, A, 107th Penn., age 32.	Sept. 17, Oct. 4,'62.	Left; 5½ inches upper third tibia excised. Disch'd Feb. 3, 1864; non-union; limb useless; deformed; should be amputated.
25	*Howard, J. M.*, Pt., F, 49th N. C., age 24.	May 16, 23, 1864.	Right; 3 inches of tibia excised. Furloughed August 22, 1864.
26	*Jenkins, W. H.*, Pt., Ashland Battery, age 25.	Sept. 17, Oct. 15, 1862.	Left; 3 inches fibula in middle third excised. To prison April 10, 1863.
27	Jordan, W. B., Corp'l, I, 6th Vermont, age 20.	Aug. 21, 29, 1864.	Right; 2¾ ins. lower third fibula excised. A. Surg. C. Bacon, jr., U. S. A. Disch'd July 19, 1865.
28	Langton, A., Pt., E, 27th Indiana.	May 3, 17, 1863.	Right; 4 inches middle third tibia excised. Disch'd Feb. 19, 1864; exfol.; short. 1 inch. *Spec.* 1280.
29	Lohr, S. G., Serg't, G, 19th Infantry, age 26.	Dec. 13, 25, 1862.	Right; 6 ins. middle third fibula excised; gang. Disch'd Feb. 25, 1863; paralysis of toes.
30	*Lotts, P.*, Pt., K, 5th ——	May 3, 9, 1863.	——; 2 inches upper third tibia exc'd. Recovery: useful limb.
31	Lucas, W. J., Pt., H, 148th Penn., age 21.	Aug. 25, 29, 1864.	Left; 2¼ ins. low. th'd fibula exc'd. Surg. N. R. Moseley, U. S. V. Disch'd Mar. 27, '65; anch. ank. Died June 7, 1868. *Spec.* 1982.
32	[1]Lynn, A., Pt., F, 47th Pennsylvania, age 18.	Oct. 19, Nov. 1, 1864.	Right; 2½ ins. middle third tibia excised. A. A. Surg. W. Kempster. Disch'd Oct. 14, 1865.
33	Lytle, H., Serg't, A, 83d Pennsylvania, age 22.	Sept. 30, Oct. 17, 1864.	Right; 2½ ins. mid. th'd fibula and half the thickness of tibia exc'd. A.A.Surg. J. H. Robinson. Discharged July 31, 1865; necrosis.
34	Malow, L., Pt., F, 24th Illinois.	Sept. 19, 29, 1863.	Left; upper third tibia excised. Surg. I. Moses, U. S. V. Disch'd August 6, '64; periostitis. Died June 10, 1876. *Spec.* 2149.
35	Mann, O. L., Lieut. Col., 39th Illinois, age 31.	May 20, June 8, 1864.	Left; portion of mid. tibia excised. A. Surg. E. McClellan, U. S. A. Disch'd Dec. 6, '65. 1870, bone discharging.
36	Merrihew, D. J., Corp'l, I, 121st N. Y., age 22.	Mar. 25, April 8, 1865.	Right; 2 inches lower third fibula excised. A. A. Surg. J. H. Robinson. Disch'd Aug. 2, 1865.
37	Minor, W. W., Pt., H, 2d Wisconsin, age 46.	May 5, 30, 1864.	Right; 8 inches lower part fibula excised. Disch'd Sept. 23, 1864; bone carious.
38	Morrow, H. A., Col., 24th Michigan, age 33.	May 6, 11, 1864.	Right; portion of up. third fibula excised. Surg. H. W. Ducachet, U. S.V. Disch'd June 30, 1865.
39	Nash, O. T., Pt., K, 12th Wisconsin, age 21.	Aug. 23, 29, 1864.	Left; 4 inches middle third fibula excised and artery lig. Surg. A. J. Miller, 13th Iowa. Disch'd June 30, 1865.
40	Oberrender, J. S., Lieut., E, 96th Penn., age 35.	May 6, 14, 1864	Left; 2 inches lower third fibula excised. A. A. Surg. J. O. Stanton. Disch'd Sept. 20, 1864; anchylosis ankle joint.
41	Olinger, G., Pt., D, 100th Ohio, age 22.	Aug. 6, Sept. 1, 1864.	Left; 4 inches mid. third fibula excised. Gangrene. Disch'd May 26, 1865.
42	Peters, M. H., Lieut., F, 74th Ohio, age 21.	May 9, 15, 1864.	Right; 2½ ins. middle third tibia excised. Surg. C. N. Ellinwood, 74th Ill. Disch'd July 10, 1865; bone discharging.
43	Pfeifer, J., Pt., F, 108th Ohio, age 19.	May 14, 21, 1864.	Left; 2 inches lower third fibula excised. A. Surg. C. C. Byrne, U. S. A. Disch'd May 23, 1865; anchylosis ankle joint.
44	Pierce, W. K., Serg't, D, 183d Penn., age 20.	May 10, June 5, 1864.	Left; 2 inches upper third tibia exc'd. Surg. E. Bentley, U.S.V. Disch'd July 15, 1865; ½ inch shortening; exfoliation.
45	Raymond, J. O., Serg't, E, 60th N. Y., age 29.	May 3, 17, 1863.	Left; 2 inches lower third tibia excised. Disch'd Mar. 21, 1864. Sept., 1877, exfol.; deformity.

62	Brown, O., Pt., A, 147th New York.	July 1, 6, 1863.	Right; portion of tibia excised. Died July 14, 1863.
63	Bull, J. H., Serg't, H, 94th Ohio, age 21.	May 15, June 13, 1864.	Left (necrosis); 3½ ins. tibia exe'd. A. A. Surg. H. C. May. Died June 23,'64; pyæm. *Spec.* 3367.
64	Conrad, H., Pt., I, 24th Michigan, age 21.	May 6, 19, 1864.	Left; 1 inch up. third fibula exe'd. Surg. O. A. Judson, U. S. V. Post. tibial art. divided; gang. May 22, amp. thigh. Died May 27, 1864; pyæmia. *Spec.* 3653.
65	Curtis, F., Pt., 17th Vermont, age 31.	June 2, 9, 1864.	Right; 2½ inches low. third fibula excised. Surg. O. A. Judson, U. S. V. June 11, 1864, hæm. Died June 17, 1864; exhaustion.
66	DeWitt, J. E., Pt., A, 9th N. Y. Cavalry, age 23.	June 21, 25, 1864.	Right; por. up. third fibula exe'd and peroneal artery lig. A. A. Surg. O. P. Sweet. Prostration and hæmorrhage. Died June 25, 1864; exhaustion.
67	Esworthy, W. N., Corp'l, E, 1st Penn. Cavalry, age 24.	June 21, July 6, 1864.	Left; 5 ins. up. third tibia exe'd. A. A. Surg. O. P. Sweet. Died July 23,'64; pyæm. *Spec.* 2940.
68	Forester, G. W., Pt., A, 188th Penn., age 45.	June 3, 15, 1864.	Right; 4 ins. lower third fibula excised. A. A. Surg. F. G. H. Bradford. Died July 6, 1864; irritative fever.
69	Freeman, G. B., Pt., F, 58th Mass., age 32.	June 3, 9, 1864.	Right; lower third fibula exe'd and lig. posterior tibial artery. Surg. O. A. Judson, U. S. V. Died June 17, '64; exhaustion.
70	Gay, E., Corp'l, H, 18th Wisconsin.	April 6, —, 1862.	——. Ass't Surg. W. D. Turner, 1st Illinois L. Art'y. April, '62, amputation thigh. Died April 22, 1862; pyæmia.
71	Gilmore, M., Pt., D, 54th Massachusetts.	July 18, 23, 1863.	Left; 6 ins. tibia and 1 inch lower part fibula exe'd. Mortification. July 27, amputat'n thigh. Died July 27, 1863.
72	Golden, J. P., Pt., F, 6th New York H'vy Art'y, age 27.	May 19, 29, 1864.	Right; 4 inches lower third fibula exe'd. A. A. Surg. O. P. Sweet. Died June 9, 1864; pyæmia.
73	Grainger, S. M., Pt., A, 38th Indiana, age 23.	Dec. 31, 1862, Jan. 14, 1863.	Left; fract. portions of tibia and fibula excised. Gang. Mar. 15, amp. knee joint. April 1, hæm. Died April 23, 1863.
74	Grimes, H. M., Pt., C, 116th New York.	May 27, June —, 1863.	Left; 4½ inches lower third tibia excised. Died Aug. 14, 1863; diarrhœa. *Specs.* 1307, 2956.
75	Jones, A. M., Pt., H, 21st Mass., age 22.	June 2, 25, 1864.	Left; 4 ins. mid. th'd fibula exe'd. A. A. Surg. F. G. H. Bradford. Died June 30, '64; exhaustion.
76	Luther, A. E., Pt., E, 3d Mass. Cavalry, age 32.	Mar. 4, 13, 1864.	Left; 3 inches fibula, lower third, excised. A. A. Surg. R. W. W. Carroll. Peroneal art. wounded. Mar. 15, hæm.; 19th, amp. leg. Died April 6, 1864; pyæmia.
77	McGuire, T., Pt., D, 53d Pennsylvania, age 19.	Dec. 13, 31, 1862.	Left (hæm.); 3 ins. up. extremity fibula excised; lig. fem. artery; sphacelus. Died Jan. 3, 1863.
78	Mink, H., Pt., H, 4th N. York Heavy Artillery, age 20.	April 2, 17, 1865.	Left; portion upper third tibia and fibula exe'd. Surg. B. A. Vanderkieft, U. S. V. Died May 11, 1865; exhaustion. *Spec.* 4101.
79	Mitchell, S., Pt., D, 188th Pennsylvania, age 23.	June 3, 27, 1864.	Left; 2 inches fibula, upper third, exe'd (hæm.); lig. peroneal art. A. A. Surg. H. W. Merrill. Died Aug. 7, 1864; chronic diarrhœa.
80	Partridge, G. V., Saddler, B, 4th Mass. Cavalry, age 21.	April 2, 9, 1864.	Left; portion of tibia exe'd. also lig. ant. tibial art. A. A. Surg. W. A. Greenleaf. April 27, hæm. Died May 2, 1864; pyæmia.
81	Perkins, P. D., Pt., B, 12th New Hampshire, age 32.	June 3, 13, 1864.	Left; 1½ inch fibula exe'd, upper third. A. Surg. H. Allen, U. S. A. (Hæm.) Died June 25, 1864; pyæmia.
82	Shorey, B., Pt., D, 3d Maine, age 30.	May 10, June 8, 1864.	Right; 6 ins. tibia excised. A. Surg. A. Delany, U. S. V. June 26, gang. Died July 1, 1864.
83	Sprague, O., Pt., F, 73d New York, age 45.	May 5, June 2, 1864.	Right; 2 ins. middle third tibia excised. Surg. R. B. Bontecou, U. S. V. Died July 6, 1864; exhaustion.
84	Tobin, T., Pt., E, 61st New York, age 23.	June 3, 8, 1864.	Right; 3 inches lower third tibia exe'd. Surg. E. Bentley, U. S. V. Died June 22, '64; pyæmia.
85	Travis, S., Pt., H, 137th New York, age 22.	Oct. 28, No. 19,'63.	Left; portion middle third tibia exe'd. Died Nov. 23,'63; pyæm.
86	Welsh, D. G., Pt., F, 28th New Jersey.	Dec. 13, 26, '62.	Right; lower third fibula exe'd. Died Jan. 5, 1863.
87	White, S. G., Pt., A, 14th New York H'vy Artillery, age 37.	Aug. 21, Sept. 1, 1864.	Left; 2 inches lower third fibula exe'd. A. A. Surg. R. E. Price. Sloughing. Died Sept. 13, 1864; exhaustion.

Twenty-one intermediary excisions, with eight deaths, were in the upper third of the leg; thirty-five, with seven deaths, in the middle third; twenty-four, with nine deaths in the lower third; and in seven, with five deaths, the precise locality was not indicated.

Secondary Excisions in the Continuity of the Bones of the Leg.—In point of mortality, the secondary excisions in the bones of the leg were attended by better results than the primary and intermediary operations, only eight of the fifty cases of this group having fatal issues. The excision included both bones in five, the tibia alone in thirty-one, and the fibula in fourteen instances.

[1] Holloway (J. M.), *Consecutive and Indeterminate Hæmorrhage from Large Arteries after Gunshot Wounds; with Report of Cases treated by Different Methods; Appreciation*, in *American Journal Medical Sciences*, 1865, Vol. L, N. S., p. 348.

Recoveries after Secondary Excisions in the Continuity of the Bones of the Leg.—This group includes forty-two operations, five performed on Confederate and thirty-seven on Union soldiers. Three of the latter, it appears, never applied for pensions, and thirty-four became pensioners after their discharge from the service. Four have since died—two from remote results of the injuries, one from phthisis, and one from cause not stated. Of the complications during treatment are noted gangrene in five instances and hæmorrhage in one.

CASE 718.—Corporal J. Downey, Co. D, 56th Pennsylvania, aged 23 years, was wounded in the left leg, at Bull Run, August 28, 1862. He was admitted to Eckington Hospital, Washington, several days afterwards, where the injury was noted but no treatment recorded. Surgeon J. Hopkinson, U. S. V., in charge of Mower Hospital, Philadelphia, made the following record of the case: "The wound was caused by a ball, which entered the outer side of the tibia, fracturing the bone, and emerging on the inner side of the leg at the lower third. The tibia was resected at Eckington Hospital, from where the patient was transferred to this hospital September 23, 1863, the wound being nearly healed." Subsequent entries show that in addition to applications of water dressings to the wound the patient for a time received treatment for a syphilitic affection. He remained in the hospital until January 17, 1865, when he was mustered out and pensioned. Examining Surgeon D. W. Shindle, of Sunbury, Pennsylvania, certified to the fracture and excision, and added: "The wound healed, leaving the leg, however, very crooked, shortened, and necessarily much weakened, and rendering his locomotion unsteady, difficult, and at times painful, also liable to tire in standing as well as walking. General system much impaired." The pensioner died of phthisis pulmonalis, October 20, 1876, his attending physician testifying that the injury remained "a constant source of irritation until a short time previous to his death. Exfoliation of bone was frequent, resulting in nervous prostration, innutrition, and impairment of his general health, a condition favorable to the development of tubercle. He never would undergo an operation for the removal of sequestra," etc. The specimen (FIG. 281), embracing the removed portion of the tibia and showing some periosteal thickening, was forwarded by Surgeon J. R. Smith, U. S. A., having been excised on October 4, 1862.

FIG. 281.—Four ins. of left tibia excised. *Spec.* 555.

CASE 719.—Private J. Lagro, Co. F, 10th Vermont, aged 18 years, was wounded at Cold Harbor, June 3, 1864. Surgeon R. Barr, 67th Pennsylvania, reported his admission to the field hospital of the 3d division, Sixth Corps, with "shot fracture of left leg, caused by a musket ball." Assistant Surgeon W. Webster, U. S. A., described the injury as a "compound fracture of the tibia and fibula at the upper third," and reported: "The patient entered De Camp Hospital, David's Island, twelve days after he was wounded. On July 30th, the parts being gangrenous, excision was performed by Acting Assistant Surgeon H. Sanders, who removed about four inches of the tibia and three inches of the fibula. Ether was used as the anæsthetic. The patient did well after the operation." On February 10, 1865, he was transferred to Burlington, and subsequently to Sloan Hospital, Montpelier. Surgeon H. James, U. S. V., in charge of the latter, contributed a photograph (*Card Photographs*, A. M. M., Vol. II, p. 1), and reported that the patient was able to walk with crutches, but could not bear much weight on the limb. Several months afterwards the patient was re-transferred to De Camp Hospital for the purpose of having his wounded leg fitted with an apparatus, which was supplied by Dr. E. D. Hudson, of New York City. He was ultimately discharged October 26, 1865, and pensioned. Examiner O. F. Fassett, of St. Albans, certified, September 10, 1866: "Wound of left leg, with fracture of both bones. It is now an open sore from necrosis. The bones have never united except by ligament, so that a false joint now exists. The bone is much denuded and so much deformity exists that no treatment but amputation can be of any benefit; the leg is worse than useless." In 1877, the same examiner again reported "the wound still an open, suppurating, and discharging sore, the bone being extensively diseased. The disease is so near the joint that amputation must be above the knee. His condition now is worse than with loss of the leg above the knee. The leg is bent into a curve and greatly deformed." Three years later the disease of the bone was reported to be extending almost or quite to the joint, and the pensioner's health as failing in consequence of the suppuration, his appearance being pale, anæmic, emaciated, and weak. He was paid June 4, 1880.

CASE 720.—Private R. L. Noe, Co. D, 5th Michigan, aged 35 years, was wounded at Fair Oaks, May 31, 1862, and entered De Camp Hospital, David's Island, two weeks afterwards. Acting Assistant Surgeon J. E. Steel reported: "He was wounded by a rifle ball, which passed through the fibula of the left leg about the middle. The patient had received no previous treatment. After the removal of several small pieces of bone and some blue cloth the wound healed; but subsequently it again suppurated and continued to do so for two months. I then deemed it necessary to exsect (with the approval of Surgeon J. Simons, U. S. A., in charge of the hospital) the entire fibula. The patient having been placed under the influence of chloroform, I made an incision from the head of the bone to within an inch of the external malleolus and found that it was difficult to remove the bone in longer pieces than about three inches, some of them of course being much smaller and adherent to the tendons, which had to be pulled off with the forceps. On carefully examining the bone I found that about one inch of the external malleolus could be preserved, which was done, thereby avoiding the opening of the ankle joint. The operation was attended with a great deal of venous hæmorrhage; but there being no artery of any importance severed, it was not found necessary to apply any ligature. No sutures were employed, the lips of the wound being brought together by adhesive plaster and then firmly bandaged. The wound healed two-thirds of its length by first intention. The patient recovered in three weeks and was able to leave the hospital six weeks after the operation." He was discharged from service December 31, 1862, and pensioned. Examiner M. L. Green, of Pontiac, Michigan, certified, May 7, 1863: "The fibula has been removed and the leg is now useless, having no support upon the outer side. Can never be of any service to him." Examining Surgeon C. Earl subsequently reported: "There remains a cicatrix extending from knee to ankle, involving the tendons and muscles and causing loss of power of leg. The tibialis anticus muscle is destroyed." In September, 1877, the same examiner stated: "Near the ankle the cicatrix has the appearance of breaking out again soon, as the tissues are getting dark and infiltrated." The pensioner was paid March

4, 1880. The head of the removed fibula together with part of the necrosed shaft, contributed by the operator, constitute specimen 1003 of the *Surgical Section* of the Museum.

Three of the forty-two survivors of secondary excision in the bones of the leg afterwards submitted to amputation in the lower third of the thigh.[1]

Fatal Cases of Secondary Excisions in the Continuity of the Bones of the Leg.—The eight operations of this group were performed on Union soldiers. The fatal issue was ascribed to pyæmia in one, gangrene in one, hæmorrhage in one, shock of operation in one, and to exhaustion and typho-malarial fever in two cases each. In one instance the excision was followed by amputation in the leg and subsequent amputation in the thigh.[2]

CASE 721.—Private E. J. Wyman, Co. A, 6th Wisconsin, aged 22 years, was wounded in the right leg, at Hatcher's Run, February 7, 1865. Surgeon D. C. Chamberlain, 94th New York, reported his admission to the field hospital of the 3d division, Fifth Corps, and described the injury as a "fracture of tibia." From the field the wounded man passed to the Point Lookout Hospital, subsequently to Judiciary Square Hospital, Washington, and on June 15th to Harvey Hospital, at Madison. Surgeon H. Culbertson, U. S. V., in charge of the latter, who operated in the case, communicated the following description of the result: "The tibia was fractured in the upper fourth. On July 2d, when the operation was performed, the wound was apparently healing, but had recently been gangrenous. Venous hæmorrhage appeared, and the bone was carious and softened. Some new bone had been thrown out at the seat of the fracture and had also become diseased. This presence of diseased bone and unhealthy discharges induced the hæmorrhage and previous gangrene and caused the patient's constitutional condition to be much impaired. The operation consisted of the excision of five inches of the shaft of the tibia, beginning opposite the opening of the interosseus membrane, making an incision in the middle line of the bone, and separating the skin, periosteum, and muscles by enucleation. The chain saw was then passed beneath the bone below, the shaft sawn through and raised from below upward. At the upper part the bone was divided with the forceps. No vessels were divided or important nerves injured during the operation. Chloroform was used as the anæsthetic with good effects. The edges of the wound were approximated, having been packed with lint, and persulphate of iron was used at the seat of the venous hæmorrhage, a light bandage being applied over all. The limb was secured in a plaster-of-Paris splint and arranged so as to expose the wound. The treatment consisted of animal broths, alcoholic stimulants, quinine, and iron. The case did well for one week, when the patient had a slight chill, which recurred at regular intervals morning and evening, and was followed by fever and sweating. Antiperiodics were persistently used without any good effect. The patient died of exhaustion, resulting from typho-malarial fever, July 23, 1865. The wound had been lacking in action, but the matter, though sparse, was healthy."

TABLE LXV.

Summary of Fifty Secondary Excisions in the Bones of the Leg for Shot Injury.

[Recoveries, 1–42; Deaths, 43–50.]

No.	NAME, MILITARY DESCRIPTION, AND AGE.	DATES.	OPERATIONS, OPERATORS, RESULT.	No.	NAME, MILITARY DESCRIPTION, AND AGE.	DATES.	OPERATIONS, OPERATORS, RESULT.
1	Barber, C., Pt., E, 88th Penn., age 30.	July 1, Dec. 19, 1863.	Left; portion of upper third fibula exc'd. Surg. C. N. Chamberlain, U. S. V. Disch'd Sept. 17, 1864; ankle joint anchylosed.	9	Collins, M., Pt., G, 1st Michigan.	Aug. 30, 1862, Mar. 17, 1863.	Right; head of fibula exc'd. Surg. D. P. Smith, U. S. V. (Necro.) Disch'd April 27, '63; anchylosis knee joint. *Spec.* 1193.
2	Bounting, R. A., Corp'l, K, 16th Mich., age 26.	July 1, Sept. 4, 1862.	——; por. of up. third tibia exc'd. A. A. Surgeon A. W. Colburn. Disch'd Nov. 17, 1862; lame.	10	Davis, W., Pt., D, 89th Illinois, age 27.	Nov. 25, 1863, June 10, 1864.	Right; mid. third of tibia exc'd. Surgeon L. D. Harlow, U. S. V. Feb. 4, 15, 1865, sequestra rem'd. Disch'd June 17, '65. Died July 26, 1876; bone diseased.
3	Brown, J., Pt., D, 5th U. S. Artillery, age 25.	June 27, Sept. 6, 1862.	Left; por. of tibia, mid. th'd, exc'd. Disch'd Dec. 29, '62. Leg shortened and distorted. *Spec.* 412.	11	Downey, J., Corp'l, D, 56th Penn., age 23.	Aug. 28, Oct. 4, 1862.	Left; 4½ ins. low. third tibia exc'd. Disch'd Jan. 17, '65; leg crooked. Died Oct. 20, 1876; phth. pulmo. *Spec.* 555.
4	Brunett, N., Pt., G, 1st Penn. Rifles, age 22.	June 17, Nov. 28, 1864.	Left; head and 2 ins. fibula exc'd. A. A. Surg. C. B. King. (Necro.) To Vet. Res. Corps May 1, 1865.	12	Fergus, J., Pt., A, 70th Indiana, age 34.	May 14, June 24, 1864.	Left; 3 ins. mid. third fibula exc'd. A. A. Surg. T. H. Hammond. Gang.; post. tibial art. sloughed; hæm. Aug. 15, 1864, amputat'n thigh. Disch'd Jan. 20, 1865.
5	Bryant, J., Pt., B, 62d Pennsylvania, age 40.	June 27, July 29, 1862.	Right; portion of middle third tibia excised. Disch'd Jan. 30, 1863; necrosis; shortening and deformity.	13	*Fitzgerald, T. J.*, Pt., K, 6th Louisiana.	Sept. 19, De.—, '64.	Left; 2½ inches middle third tibia exc'd. Released Aug. 25, 1865.
6	Bullock, J. L., Corp'l, C, 5th Minnesota, age 36.	De. 16, '64, Jan. 25, 1865.	Left; 3¼ inches middle third tibia excised. A. A. Surg. J. Butterbaugh. Disch'd Nov. 23, 1865; leg scarcely of any use; cartilaginious union only.	14	Fowler, L., Pt., E, 6th Wisconsin, age 27.	Au. 30, '62, Feb. 16, 1863.	Right; 3 inches lower third tibia, ⅔ of its thickness excised. Duty July 1, 1863.
7	Canty, T. F., Pt., D, 63d New York, age 24.	Aug. 14, 1864, ——, '66.	Right; 5ins. low. th'd fibula exc'd. Dr. J. E. Pomfret. Disch'd May 30, '65; bone exfol.; unhealed in 1872; requires bandages, 1875.	15	Gray, E. T., Pt., B, 38th Ohio, age 23.	Aug. 4, Sep. 4, '64.	Left; 4 ins. tibia and 8 ins. fibula excised. Disch'd May 12, 1865.
8	Collins, J., Pt., B, 12th Mass., age 19.	Sept. 17, Nov. 11, 1862.	Left; por. of up. third tibia exc'd. A. A. Surg. A. V. Cherbonnier. To Vet. Res. Corps July 1, 1863.	16	*Harris, J.*, Pt., H, 12th South Carolina, age 30.	Sept. 17, 1862, Jan. 26, 1863.	——; fract. por. upper thirds tibia and fibula exc'd. A. A. Surg. A. North. To Provost Marshal May 16, 1863.

[1] Cases of: Pt. J. Fergus, A, 70th Indiana, left thigh, secondary operation in lower third (TABLE XL, page 320, No. 34); Corp'l T. O'Dell, Co. H, 5th Michigan, left thigh, secondary operation in lower third (TABLE XL, page 321, No. 73); Serg't J. Lowth, M, 4th Wisconsin Cavalry, right thigh, secondary operation in lower third (TABLE XL, p. 320, No. 57).

[2] Case of Pt. H. Linn, A, 6th Pennsylvania Reserves, left leg amputated Dec. 4, 1862, in middle third; January 15, 1863, amputation in thigh at middle third; hæmorrhage, Feb. 4, 1863, ligation of femoral artery; death March 31, 1863. *Specs.* 748, 3818, 3983 (TABLE XXXIX, p. 315, No. 137).

No.	Name, Military Description, and Age.	Dates.	Operations, Operators, Result.
17	Holt, T., Pt., G, 15th Mass., age 19.	Sept. 17, 1862, Feb. 2, '63.	Left: head of fibula exc'd. Surg. S. D. Freeman, U. S. V. Disch'd Feb. 4, 1864. *Spec.* 1109.
18	Jones, E. P., Pt., K, 22d Michigan.	Sept. 20, 1863, Jan. 10, 1864.	Left; necrosed ends of mid. third tibia exc'd. A. A. Surg. D. O. Farrand. Gang. Disch'd Oct. 12, 1864.
19	Lagro, J., Pt., F, 10th Vermont, age 18.	June 3, 1864, July 30, 1864.	Left; 4 inches tibia and 3 inches fibula, up. third, exc'd. A. A. Surg. H. Sanders. (Gangrene.) Disc'd Oct. 26, '65; much deform.; false joint.
20	Lennox, W., Pt., F, 82d New York.	July 3, Sept. —, 1863.	Left; middle third tibia excised. Surgeon A. B. Mott, U. S. V. (Necrosis.) Discharged July 25, 1864.
21	*Lord, B. E.*, Pt., H, 24th Georgia, age 23.	Sept. 14, Nov. 26, 1862.	Left; 3½ inches upper third tibia excised (caries and necrosis). Paroled April 27, 1863.
22	Lowth, J., Serg't, M, 4th Wisconsin Cav., age 26.	Aug. 24, 1864, May 27, 1865.	Right; 6 inches upper part fibula excised. Surg. H. Culbertson, U. S. V. Lig. post. tibial artery (caries; gang.). June 2, amp. thigh. Disch'd July 17, 1865.
23	Luce, J. B., Pt., F, 179th New York, age 30.	June 17, Oct. 24, 1864.	Right; 8½ ins. tibia exc'd. A. A. Surg. W. P. Moon. (Sloughing; bone diseased.) Disch'd Dec. 31, 1864; leg useless.
24	McIlheran, J., Pt., C, 116th Illinois, age 24.	July 22, 1863, March 7, 1864.	Right; up. third and head of tibia, except shell of bone articulating, excised. Surg. J. G. Keenon, U.S.V. (Carious.) Disch'd Feb. 24, 1865.
25	McQuiggan, J., Pt., E, 82d Penn., age 20.	July 1, Sept. 1, 1862.	Left; middle third tibia excised. A. A. Surgeon G. H. Dare. December, 1862, another operation. Discharged July 3, 1863. *Spec.* 428.
26	Mears, J. E., Pt., G, 81st Pennsylvania, age 20.	July 1, Aug. 21, 1862.	Right: middle third tibia excis'd. Disch'd Feb. 27, 1863; considerable shortening and deformity. *Spec.* 398.
27	Noe, R. L., Pt., D, 5th Michigan, age 35.	May 31, Nov. —, 1862.	Left; almost entire fibula excis'd. A. A. Surg. J. E. Steele. Disc'd Dec. 31, 1862; leg of not much service. *Spec.* 1003.
28	Odell, T., Corp'l, H, 5th Michigan, age 20.	June 18, Sept. 7, 1864.	Left; up. third tibia exc'd. A. A. Surg. J. M. Boisnot. Sloughing. Jan. 13, '65, amp. thigh. Disch'd May 22, 1865.
29	Ohmit, S. K., Pt., D, 1st Penn. Res., age 20.	June 30, 1862. Sept. 23, 1862.	Left; 6 inches lower third tibia excised. A. A. Surgeon J. H. Boone. Disch'd Feb. 23, 1863; complete anchylosis ankle, and partial knee joints.
30	Peters, W., Pt., B, 8th Penn. Res., age 20.	June 27, 1862, Feb. 2, '63.	Left; 3½ inches upper third fibula exc'd. A. A. Surg. T. Artaud. Discharged November 28, 1865. *Spec.* 1110.
31	Pritchard, R., Pt., K, 119th Penn., age 29.	May 5, '64, Jan. 15, 1865.	Left; 3 inches lower third tibia excised. Discharged June 19, 1865. Necrosis. Died March 2, 1871.
32	Simmons, A. R., Pt., I, 2d N. Hamp., age 20.	Aug. 29, 1862, Sept. 16, 1864.	Left; 3 inches middle third fibula excised and sequestrum of tibia removed. Ass't Surg. H. Allen, U. S. A. (Discharged Nov. 20, 1862; non-union; necro.); w'nd re-opened. 1877, bone carious.
33	Smith, G., Pt., A, 1st N. York Cavalry, age 34.	March 9, Sept. —, 1863.	Left; portion of lower third tibia excised. Surgeon A. B. Mott, U. S. V. Discharged Aug. 5, 1864; 1866, bone diseased; 1873, bone healed.
34	Thompson, T. E., Corp'l, I, 89th New York, age 24.	May 20, 1864, July 1, 1864.	Right; 2 inches tibia, lower third, exc'd. Ass't Surg. W. D. Woolverton, U. S. A. Disch'd Oct. 11, 1865. Died May 3, 1873; lungs diseased.
35	*Vaughn, A. S.*, Pt., K, 57th Virginia, age 24.	July 1, Aug. 4, 1863.	——; 3½ inches lower third tibia exc'd. A. A. Surg. E. Borck, jr. (Necrosis.) Paroled August 22, 1863.
36	Vollmer, M., Pt., C, 136th New York, age 29.	July 4, Au. 25, '63.	Left; 1½ inch fibula, lower third, excised. Disch'd July 8, 1865.
37	Waldron, S. H., Pt., B, 17th Maine, age 19.	May 3, Nov. 3, 1863.	Right: 3 inches middle third fibula. A. A. Surgeon E. Seyffarth. (Caries; sloughing.) Disch'd July 6, 1865.
38	White, J. W., Pt., C, 113th Ohio, age 19.	June 27, J'y 30, '64.	Right; 3 inches tibia, lower third, excised. Disch'd Feb. 22, 1865; wound open.
39	*Williams, J. M.*, Serg't, G, 2d Georgia, age 23.	J'e 24, '63, Feb. 15, 1864.	Right; 3 inches lower third tibia excised. Assistant Surg. J. E. Link, 21st Ill. Provost Marshal April 15, 1864.
40	Williamson, J., Pt., G, 57th New York, age 42.	June 16, Nov. 7, 1864.	Left; 5 inches middle third tibia excised. A. A. Surgeon W. P. Moon. Discharged June 28, '65; new bone formed.
41	Wilson, G. E., Pt., D, 30th Mass., age 23.	Oct. 19, 1864, March 2, 1865.	Right; 3½ inches fibula, in middle third, excised. A. A. Surg. W. P. Moon. (Necrosis.) Disch'd July 22, 1865. *Spec.* 1479.
42	Wilson, J., Pt., E, 15th Infantry, age 21.	Aug. 7, Nov. 5, '64.	Right; 3 inches tibia excised. Disch'd April 1, 1865.
43	Ackley, J. B., Pt., I, 7th Infantry.	June —, J'y 29, '62.	Left; ½ of shaft of fibula excised; missile extracted. Died August 13, '62; typh. fever.
44	Evans, L., Pt., D, 11th Michigan, age 19.	July 26, Oct. 4, 1864.	Left; 3 inches middle third tibia excised. Ass't Surg. W. B. Trull, U. S. V. Died March 12, 1865; exhaustion.
45	Hockirk, O. D., Pt., A, 46th New York, age 25.	Sept. 29, Dec. 4, 1864.	Left; small por. upper thirds both bones exc'd. A. A. Surg. B. N. McCleery. July, 1865, erysip.; gang.; diarr. Died Aug. 14, '65.
46	Holmes, H., Pt., H, 50th Colored Troops.	Nov. 9, '64, J'y 20, '65.	Right; por. of tibia exc'd. Died July 24, '65; shock of operation.
47	Linn, H., Pt., A, 6th Penn. Res., age 25.	Sept. 17, Dec. 3, 1862.	Left; large por. of tibia and fibula exc'd. A. A. Surg. A. V. Cherbonnier. Dec. 4, amp. leg; hæm.; gang.; necro. Jan. 15, '63, amp. thigh. Feb. 4, lig. fem. artery; necro.; hæm. Died March 31, 1863. *Specs.* 748, 3818, 3983.
48	Pickell, G. F., Pt., K, 13th New York, age 17.	Aug. 30, Oct. 6, '62.	Left; fractured ends upper third tibia excised. Died October 29, 1862; pyæmia.
49	Richardson, H. S., Lieut., 27th Michigan.	July 12, 1863, Jan. 5, '64.	Left; 4 inches middle third tibia exc'd. Surg. C. S. Tripler, U. S. A. (Necrosis.) Died Jan. 31, 1864; malignant measles.
50	Wyman, E. J., Pt., A, 6th Wisconsin, age 22.	Feb. 7, July 2, 1865.	Right; 5 inches upper third tibia excised. Surg. H. Culbertson, U. S. V. (Bone carious; venous hæm.; gangrene.) Died July 23, 1865; typhoid malarial fever.

Excisions in the Continuity of the Bones of the Leg of Uncertain Date.—In thirty-five instances of excision in the bones of the leg, either the time of injury or of operation or of both were not recorded. Twenty-seven of the patients survived the operation, four died, and in four the final issue could not be ascertained. The excision was confined to the tibia in twenty-two, to the fibula in twelve instances, and in one case portions of both tibia and fibula were excised. Of the cases of recovery of this group nineteen were Union and eight Confederate soldiers. Seventeen of the nineteen Union soldiers were subsequently borne on the Pension Roll; one has since died, and another had the limb removed at the knee joint.[1] The four fatal operations were performed on three Confederate and one Union soldier; pyæmia being cited as the cause of death in two instances.

[1] Case of Pt. H. A. Steward, Co. B, 8th Pennsylvania Reserves, secondary operation at right knee joint (TABLE LVII, p. 409, No. 9).

TABLE LXVI.

Summary of Thirty-five Cases of Excisions in the Bones of the Leg for Shot Injury of Uncertain Date.

[Recoveries, 1—27; Deaths, 28—31; Unknown Results, 32—35.]

No.	Name, Military Description, and Age.	Dates.	Operations, Operators, Result.	No.	Name, Military Description, and Age.	Dates.	Operations, Operators, Result.
1	Davis, J. L., Pt., F, 27th New York.	June 27, ——, '62.	Right; lower third tibia excised. Disch'd Sept. 24, 1862 necrosis.	19	Quirk, P., Lieut., 2d Cavalry.	June 9, '63, ——	Left; 3 inches lower third tibia excised. Retired Jan. 5, 1865; uses staff in walking.
2	Freeland, R., Pt., G, 1st Cavalry, age 22.	Nov. 8, ——, '63.	Right; portion of tibia excised; necrosis. Duty Feb. 16, 1865.	20	Steward, H. A., Pt., B, 8th Pennsylvania Reserves, age 23.	June 27, ——, '62.	Right; large portion tibia, upper third, excised. Disch'd Nov. 20, 1862. April 1, 1867, amputation at knee joint.
3	*Gardner, W. H.*, Lieut., K, 3d Alabama.	July —, ——, '63.	——; por. of tibia excised. Paroled October 24, 1863.	21	Stineman, M. C., Pt., M, 62d Penn., age 25.	July 2, ——, '63.	Right; 5½ inches mid. third tibia excised. Disch'd Sept. 8, 1864; leg shortened and bent.
4	*Garrett, J.*, Pt., H, 12th Miss., age 24.	Aug. 21, '64, ——	Right; 4 ins. middle third fibula excised. Retired Mar. 25, 1865.	22	Walker, R., Serg't, I, 104th New York.	Sept. 17, ——, '62.	Left; 3 inches lower third tibia excised. Disch'd Dec. 20, 1862; 1½ inch shortening.
5	Harrell, J. P., Pt., F, 82d Indiana.	Sept. 19, '63, ——	Right; portion upper third fibula excised. To Vet. Res. Corps. Disch'd June 17, 1865.	23	Walker, W. T., Pt., G, 12th Massachusetts.	Sept. 14, ——, '62.	Left; 5 inches upper third fibula excised. Disch'd Dec. 13, 1862.
6	*Harris, J. D.*, Serg't, C, 14th Alabama, age 31.	May 6, —— '64.	Right; portion of fibula excised. Retired Feb. 15, 1865.	24	*Warren, O.*, Serg't, B, 44th N. C., age 24.	Oct. 27, ——, '64.	Right; portion of tibia, low. third, excised. Retired Feb. 28, 1865; partial anchylosis ankle joint.
7	Hull, F. S., Pt., G, 8th Vermont, age 34.	June 14, '63, ——	Right; por. of middle third fibula excised. Disch'd June 22, '64. 1865, exfoliation necrosed bone.	25	Wheeler, G., Pt., K, 6th N. Y. Artillery, age 43.	May 19, ——, '64.	Left; middle third fibula excised. Disch'd Jan. 7, 1865.
8	Imbrie, D., Pt., K, 10th Penn. Res., age 19.	June 27, ——, '62.	Right; 1 inch of fibula excised. Disch'd Nov. 27, 1862.	26	Williams, J. H., Corp'l, E, 15th Massachusetts.	Oct. 21, '61, ——	Left; por. low. third tibia exc'd. Disch'd Oct. 14, 1862. Died April 6, 1863.
9	Johnson, W. B., Lieut., E, 26th Ohio.	Nov. 25, '63, ——	Left; 2 inches lower third tibia excised. Disch'd Oct. 19, 1864. 1866, bone carious and exfol'ing.	27	Williams, J. O., Pt., E, 143d Penn., age 25.	July 1, ——, '63.	Left; 3 inches lower third fibula excised. Disch'd May 9, 1864; shortening; anchy. ankle joint.
10	*Jordan, N.*, Pt., C, 19th Tennessee, age 19.	Nov. 30, '64, ——	Left; 3 ins. mid. third tibia exc'd. To Pro. Marshal April 6, 1865.	28	Baldwin, H. J., Pt., E, 27th Indiana.	May 3, ——, '63.	Left; 4 ins. tibia exc'd. (Necrosis.) Died June 15, 1863; pyæmia. *Spec.* 1283.
11	Kuhn, H., Pt., H, 111th Pennsylvania, age 21.	Sept. 17, 1862.	Left; portion of lower third fibula excised. Disch'd Jan. 10, 1863; anchy. ankle joint.	29	[1] *Dukay, S. L.*, Pt., D, 15th Texas, age 24.	———	Left; 4 inches middle third tibia excised; erysipelas; gangrene. Died of pyæmia.
12	Lautenslager, S., Pt., G, 24th Michigan.	July 1, '63, ——	Left; por. of low. third tibia exc'd. Disch'd March 28, 1864; false joint in tibia; unable to bear his weight on leg.	30	*Farr, T. A.*, Serg't, B, 11th South Carolina.	———	Left; portion of tibia excised. Died May 29, 1864.
13	*Lewis, W. B.*, Pt., B, 1st Texas, age 20.	July 1, '62, ——	Right; 4 ins. middle third tibia excised. Recovery.	31	*Gray, J. F.*, Pt., B, 4th Georgia.	Mar. —, ——, '65.	Left; 12 inches of fibula excised. Died April 28, 1865.
14	Marshall, M. F., Pt., B, 5th New Jersey.	May 5, ——, '62.	Right; por. of middle third tibia excised. Disch'd Sept. 25, 1862.	32	*Knowles, L. T.*, Pt., F, 9th Georgia.	Aug. 15, '64, ——	Right; portion of fibula excised.
15	*Metcalf, J.*, Serg't, I, 54th North Carolina, age 29.	Mar. 25, ——, '65.	Left; 1½ inch of lower third tibia excised. Released Aug. 25, '65.	33	*Parnell, J.*, Pt., I, 14th South Carolina.	Aug. 16, '64, ——	Right; portion of tibia excised.
16	Mullins, J., Serg't, D, 12th Massachusetts.	July 1, ——, '63.	Left; 5 ins. tibia and por. of fibula, upper third, exc'd; gang. Discharged May 6, '64. 1877, bone still diseased.	34	*Sullnot, J. B.*, Pt., C, 44th Georgia.	Oct. 19, '64, ——	Left; partial excision of tibia.
17	*Perrin, J. T.*, Capt., E, 26th Virginia.	May 20, ——, '64.	Right; portion of upper third tibia exc'd. Furloughed Aug. 29, '64.	35	*Tatley, S.*, Pt., C, 41st Virginia, age 25.	Aug. 19, '64, ——	Left; 2½ inches fibula excised.
18	Pettee, L., Lieut., 11th Infantry.	July 2, ——, '63.	Right; 1½ inch lower third tibia excised. Duty Nov. 24, 1863.				

The side injured was not indicated in twelve of the three hundred and eighty-seven cases of excisions in the continuity of the bones of the leg. The right limb was fractured in one hundred and sixty-three—one hundred and sixteen recoveries, forty-five deaths, two unknown results,—and the left in two hundred and twelve—one hundred and fifty-four recoveries, fifty-six deaths, and two unknown results.

AMPUTATIONS IN THE CONTINUITY OF THE LEG FOR SHOT FRACTURES.—The precept of Guthrie[2] that "a leg should be seldom amputated for a fracture from a musket ball" seems to have been very generally disregarded by the surgeons of the American civil war. Of eight thousand nine hundred and eighty-eight cases of shot fractures in the continuity of the bones of the leg, of which 88.4 per cent. were caused by musket balls,[3] amputation was performed in four thousand seven hundred and ten,[4] or 52.4 per cent. Of these four thousand seven hundred and ten cases of amputations for shot

[1] ANDERSON. *Pyæmia supervening upon Hospital Gangrene*, in *U. S. Sanitary Commission Memoirs*, New York, 1871, Surgical Volume II, p. 443.

[2] GUTHRIE (G. J.), *Commentaries on the Surgery of the War, etc.*, sixth edition, London, 1855, p. 150: "The bones of the leg being more exposed, admit of greater liberties being taken with them, and of larger portions, or even parts, being taken away successfully, than ought to be attempted in the thigh. A leg should therefore be seldom amputated for a fracture from a musket ball."

[3] The nature of the missile was reported in 6,336 of the 8,988 cases of shot fractures in the continuity of the bones of the leg without primary injury to the knee or ankle joints: 79 were caused by cannon or solid shot; 654 by shells; 5,603 by musket, pistol, or other small balls; and in 2,052 instances the missile was not specified.

[4] See TABLE LI, p. 432, *ante*. The cases are: 19 excisions in the leg followed by amputations in the leg; 2 excisions in the leg with subsequent amputations in the leg and thigh; 5 excisions in the leg followed by amputations at the knee joint; 22 excisions in the leg followed by amputations in the thigh; 3,728 amputations in the leg; 3 amputations in the leg and subsequent amputation at the knee joint; 39 amputations in the leg followed by amputations in the thigh; 100 amputations at the knee joint; 7 amputations at the knee joint followed by amputations in the thigh; and 785 amputations of thigh; a total of 4,710 amputations following shot fractures in the bones of the leg.

fractures of the bones of the leg, eight hundred and seven performed in the thigh and one hundred and twelve performed at the knee joint have already been considered in the preceding two sections of this chapter. Deducting these from the four thousand seven hundred and ten cases of amputations for shot fractures in the bones of the leg, there remain three thousand seven hundred and ninety-one cases of ablation in the leg, to which should be added one thousand six hundred and sixty-one amputations in the leg following shot fractures of the ankle joint or foot, making a total of five thousand four hundred and fifty-two cases of amputations in the leg to be considered in this section. A numerical statement of the cases is contained in the following table:

TABLE LXVII.

Numerical Statement of Fifty-four Hundred and Fifty-two Amputations in the Leg for Shot Injury.

In one hundred and thirty-eight of the five thousand four hundred and fifty-two instances of amputations in the leg the final result could not be ascertained; three thousand five hundred and sixty-one had successful, and one thousand seven hundred and fifty-three fatal terminations, a mortality rate of 32.9 per cent. Three thousand three hundred and ninety-two were primary, one thousand and forty-six intermediary, four hundred and forty-four secondary, and five hundred and seventy were operations of unspecified date, the primary amputations, by far the most numerous, comprising 69.4 per cent. of the cases in which the time between the injury and the operation could be ascertained.

PRIMARY AMPUTATIONS IN THE CONTINUITY OF THE LEG FOR SHOT INJURY.—Of the three thousand three hundred and ninety-two primary operations, one thousand and twenty-nine were in the upper third, eight hundred and ninety-two in the middle third, nine hundred in the lower third, and in five hundred and seventy-one the seat of the operation was not indicated.

Primary Amputations in the Upper Third of the Leg for Shot Injury.—The results in nine of the one thousand and twenty-nine instances of this group were not ascertained; seven hundred and seventy-one had successful, and two hundred and forty-nine fatal terminations, a mortality of 24.4 per cent.

Examples of Successful Primary Amputations in the Upper Third of the Leg.—The seven hundred and seventy-one amputations of this group were performed on seven hun-

dred and sixty-six patients, five being successful amputations of both legs in the upper third. One of the cases of double amputation will be given in detail:

CASE 722.—Private S. L. Willson, Co. D, 72d New York, aged 18 years, was wounded at Gettysburg, July 2, 1863. He was admitted to the field hospital of the 2d division, Third Corps, whence Surgeon C. K. Irwin, 72d New York, reported: "Compound comminuted fracture of right and left leg by minié ball, followed by amputation of both legs." Surgeon H. Janes, U. S. V., forwarded the following history: "The patient entered Camp Letterman August 30th. Both of his legs had been shattered at the lower third, and amputation was performed at the upper third on the day following the injury. The stumps granulated well and the patient's general health was good. Simple dressings, with tonics and stimulants, constituted the treatment. On October 21st, when the man was transferred to another hospital, the stumps were in tolerable good condition. There had been ulcers in the cicatrices, threatening gangrene, which was controlled with citrine ointment, leaving small abrasions." The patient subsequently passed through hospitals at Baltimore and Alexandria, and lastly he was transferred to Rochester, where he was discharged May 31, 1865, and pensioned. Since leaving the service he has been furnished at regular intervals with artificial legs of the "Bly" pattern, which he reports as satisfactory, and the use of which enabled him to accept and hold employment as messenger of the U. S. Senate at the Capitol building for a number of years. In his several applications for these artificial limbs he described the stumps as being in good condition. His pension was paid March 4, 1880.

Brief histories of the remaining four instances of successful primary amputation in the upper third of the leg are related in the foot-note.[1]

CASE 723.—Corporal J. H. Wilkins, Co. E, 1st Louisiana, aged 25 years, was wounded at Port Hudson, June 14, 1863, and conveyed to New Orleans three days afterwards. Assistant Surgeon P. S. Conner, U. S. A., recorded his admission to University Hospital, with "amputation of left leg performed on the battle field," also his departure on furlough October 26th. Several weeks afterwards the patient entered Central Park Hospital, New York City, whence Surgeon B. A. Clements, U. S. A., reported the following history: "The wound was caused by a musket ball, which passed through the middle of the leg antero-posteriorly, comminuting both bones badly and wounding the arteries. There was much hæmorrhage. Amputation through the upper third, by antero-posterior flaps, was performed under chloroform one-half hour after the injury. At first sutures and water dressings were applied. The parts united mostly by first intention and had entirely healed at the end of six weeks. When admitted to this hospital, November 12th, the stump was in good condition and the patient's general health good. On December 20th, he contused the stump by a fall, which was followed by great swelling, heat, and pain. Four days later an abscess, which had formed two inches above the cicatrix on the anterior face of the stump, was opened, when one-half ounce of pus was discharged. By February 25, 1864, the inflammation and swelling had subsided, but there remained considerable rigidity of the knee joint, flexion and extension being imperfect. Three weeks later the swelling of the stump had entirely subsided, and several months afterwards flexion was again restored, though extension was not perfect. When discharged from service, August 9, 1864, the patient had had an artificial limb for about one month, not being able to use it very well owing to the want of perfect extending power, but improving with it constantly." The pensioner was paid March 4, 1880. A cast of the stump (*Spec.* 4371, A. M. M.), presenting an excellent appearance, with the wound well united, was contributed by Acting Assistant Surgeon G. F. Shrady, and is represented in the wood-cut (FIG. 282).

FIG. 282.—Appearance of stump one year after amput'n. *Spec.* 4371.

CASE 724.—Private Z. Holcomb, Co. B, 36th Ohio, aged 26 years, was wounded at Opequan Creek, September 19, 1864. He was admitted to the field hospital at Winchester, and thence removed, on November 12th, to Frederick Hospital. Assistant Surgeon R. F. Weir, U. S. A., in charge of the latter hospital, made the following report: "On examining the patient it was found that he had undergone an amputation of the right leg at the upper third, which was performed for a shell wound of the same at the middle and lower thirds. The stump is nearly healed. He had also a shot wound of the thigh of the same limb, the ball lodging. The latter wound was supposed to be a simple flesh wound and had entirely healed, the missile having evidently passed downward, for it could not be felt. On December 1st, there was evidence of the formation of an abscess on the posterior portion of the thigh, at the lower part of the upper third, and poultices were ordered to be applied. On December 5th, the fluctuation being well marked over the abscess, a free incision was made and about an ounce of pus evacuated. On introducing the finger the missile was then discovered, which proved to be a cast-iron ball from a Shrapnell shell, and was removed by means of a forceps by Acting Assistant Surgeon W. S. Adams. On further examination of the limb quite an amount of callus was found around the femur at the junction of the upper and middle thirds, and on questioning the patient he stated that his surgeon had informed him that a non-comminuted fracture was produced by the missile; also that a coaptation splint had been applied for the same. On measurement there was found to be a little over one inch shortening. On December

[1] The remaining four successful primary double amputations in the upper third of the leg are: 1. Lieut. E. H. Fisher, Co. A, 21st Indiana, wounded at Atchafalaya Bay, La., October 20, 1862. Half an hour after the injury Surgeon Ezra Read, 21st Indiana, removed both legs about four inches below the knee, on board Steamer St. Mary. The Lieutenant was discharged November 20, 1863, and pensioned. Examiner S. T. Williams certified, June 16, 1875, that the cicatrices of both stumps were very tender. The pensioner was paid September 4, 1878.—2. Corp'l John Lorence, Co. K, 9th New Jersey, age 35, wounded at Roanoke Island, February 8, 1862, by a cannon ball. Two hours after the injury Surgeons J. H. Thompson, U. S. V., and H. W. Rivers, 4th Rhode Island, removed both legs about two inches below the knee joint. The patient was discharged and pensioned September 30, 1862. In 1875, the pensioner declared that the knee joints are without motion and the stumps tender. He was paid March 4, 1877.—3. Pt. *S. H. Trim*, Co. B, 41st Alabama, age 19, wounded at Drury's Bluff, May 21, 1864, by explosion of a shell. On the same day Surgeon John D. Jackson, 44th Tennessee, removed both legs at point of election by circular operation. He recovered without the intervention of a single bad symptom, and was furloughed to Beaverdale, Alabama.—4. Corp'l James Tanner, Co. C, 87th New York, received a shell wound of both legs, at Bull Run, Virginia, August 30, 1862. Both limbs were removed on the field, at the upper thirds. The stumps healed perfectly, and the patient was discharged October 15, 1862, and pensioned. In 1874, he declared that the cicatrices had become adherent to bone and were very tender. He was paid June 4, 1880.

21st, when the patient was transferred, his general condition was good and the wounds were entirely healed." The missile was contributed to the Museum by the operator, and constitutes specimen 1498 of the *Surgical Section*. The patient subsequently entered Camden Street Hospital, Baltimore, and afterwards Broad and Cherry Streets Hospital, Philadelphia, and on May 20, 1865, he was discharged from Chester Hospital and pensioned. Two months afterwards he was supplied with an artificial limb by the Palmer Arm and Leg Company of Philadelphia. Examiner A. B. Monahan, of Jackson, Ohio, September 6, 1876, certified: "The pensioner has lost his right leg three inches below the knee joint. The stump is tender and he cannot wear an artificial leg. There is also a wound of the right thigh, the ball striking the femur, upper third, and passing down about three inches, where it lodged and was removed. There is caries of the femur and the wound is open, small spiculæ of bone being sloughed through the opening. The thigh is painful, lame, etc." The pensioner was paid September 4, 1880.

In the following instance the amputation was performed close to the knee joint, through the tuberosity of the tibia, and the fibula was disarticulated—a method advocated and frequently performed by the elder Larrey:[1]

CASE 725.—Private *J. Strider*, Co. K, 56th North Carolina, aged 34 years, was wounded at Plymouth, April 20, 1864, by a minié ball, which produced a compound comminuted fracture of the right tibia. Surgeon C. H. Ladd, C. S. A., who amputated the leg on the day of the injury, reported: "The operation was performed by the circular skin-flap method close to the knee joint, and the fibula was disarticulated. The stump healed by first intention. I have never before or since performed an amputation so close to the knee joint; think it might often replace disarticulation at the knee joint or amputation above." The patient recovered and was retired from service January 17, 1865.

One of the seven hundred and seventy-one survivors after primary amputation in the upper third of the leg subsequently underwent amputation at the knee joint, and nine, amputation in the thigh:

CASE 726.—Private J. Morrin, Co. G, 126th New York, aged 21 years, was wounded at Gettysburg, July 3, 1863, and admitted to the field hospital of the 3d division, Second Corps. Surgeon I. Scott, 7th West Virginia, recorded: "Compound comminuted fracture of left leg by minié ball, followed by posterior flap amputation by Surgeon J. Aiken, 71st Pennsylvania." The patient remained in hospital at Gettysburg for three months and was then transferred to Philadelphia, whence Surgeon J. Hopkinson, U. S. V., in charge of Mower Hospital, reported the following description and progress of the case: "The tibia and fibula had been shattered to such an extent that amputation below the knee was rendered necessary on the field. When admitted to this hospital, September 9th, the flaps were open and the ends of the bones exposed. Gangrene had set in and the patient was in a low and typhoid condition. A solution of sulphate of copper was applied to the stump, and quinine with tincture of chloride of iron was prescribed internally; milk punch and beef tea at pleasure. The patient improved under the treatment until November 3d, when hæmorrhage from the anterior tibial took place at 11½ P. M. Amputation of the lower third of the thigh (see TABLE XL, No. 69, p. 321, *ante*) by antero-posterior flaps was then resorted to by Assistant Surgeon T. C. Brainerd, U. S. A. Sixteen ounces of blood were lost. Injections of brandy and carbonate of ammonia were given to induce reaction, which took place six hours after the operation. After reaction had fully set in the patient continued to improve until recovered. The ligatures were removed on November 19th. By January 9, 1864, the cicatrix had entirely healed, leaving a most excellent stump." The subsequent record of the case was furnished by Surgeon B. A. Clements, U. S. A., who reported that "the patient was admitted, March 30, 1864, to Central Park Hospital, New York City, where several months later two sinuses were discovered in the cicatrix of the stump, leading to necrosed bone. On November 23d, the patient was put under the influence of chloroform and a transverse incision, three inches long, was made across the lower edge of the flap, when it was found that a ring of bone had exfoliated from the end of the femur, but was still bound down by an overlapping growth of new bone from the endosteum. This, with a portion of the new growth, was removed by Acting Assistant Surgeon S. Teats, assisted by Acting Assistant Surgeon J. K. Merritt." The patient remained under treatment until June 17, 1865, when he was discharged from service and pensioned. Examining Surgeon R. C. Dunham, of Seneca Falls, N. Y., August 6, 1873, certified to amputation of the thigh and added: "There is no amount of flesh over the end of the bone; it is covered by the skin only, and it appears to be very tender to the touch. He cannot wear an artificial limb very long at any time to be of any use to him by way of walking or standing," etc. The pensioner was paid June 4, 1880. The stumps of the tibia and fibula, removed at the second amputation, and the nearly circular sequestrum, together with four small fragments removed at the last operation, were contributed to the Museum by the operators. They constitute specimens 2604 and 1416, respectively, of the *Surgical Section*. A representation of the former appears in the wood-cut (FIG. 283).

FIG. 283.—Bones of stump of left leg three months after amputation. *Spec.* 2604.

Six hundred and twenty-seven of the patients who recovered after primary amputation in the upper third of the leg were Union soldiers. Of these, three officers were retired from the service, and six hundred and twenty-one enlisted men became pensioners. The

[1] LARREY (D. J. (*Memoires de Chirurgie Militaire et Campaigns*, Paris, 1812, T. II, p. 194): "Les auteurs conseillent l'amputation de la cuisse pour les coups de feu à la jambe, lorsque les os de ce membre sont fracturés jusqûà l'articulation du genou: ce précepte n'est réellement fondé que pour les fractures du tibia; car l'expérience m'a appris que, quand même le péroné serait fracassé jusqu'à son articulation avec le condyle du tibia, pourvu que ce dernier soit intact dans son extremité supérieure, a l'attache du tendon rotulien, l'opération est encore practicable à la jambe: il faut seulement, dans ce cas, après avoir scié les deux os an niveau de la tubérosité, faire une incision, en dehors sur les parties molles qui recouvrent le péroné, en suivant sa direction, ouvrir son articulation, le séparer du tibia, et en faire l'extraction totale."

names of three of the patients cannot be found on the Pension Rolls. Fifty-one of the pensioners have died since the date of their discharge.

FIG. 284.—Bones of left leg fractured in upper third. *Spec.* 4081.

CASE 727.—Private J. Walsh, Co. A, 57th Massachusetts, aged 39 years, was wounded at Fort Steadman, March 25, 1865, by a musket ball, which fractured the left leg in the upper third, perforating the tibia transversely and completely destroying the upper part of the fibula. Surgeon M. K. Hogan, U. S. V., reported the wounded man's admission to the field hospital of the 1st division, Ninth Corps, where the leg was amputated below the knee by Surgeon W. C. Shurlock, 51st Pennsylvania. Assistant Surgeon S. Adams, U. S. A., who contributed the amputated bones (*Spec.* 4081), represented in the annexed wood-cut (FIG. 284), reported that the patient nearly died during the operation from the effects of chloroform, having become pulseless and his respiration having ceased. One week after the reception of the injury the patient was sent to City Point, and afterwards he passed through various hospitals, being ultimately discharged from service September 12, 1865, and pensioned. In the statement subsequently furnished by B. F. Palmer, of Philadelphia, for an artificial leg, the amputation was described as having been performed by the "flap method." In his application for commutation, dated 1870, the pensioner described the condition of the stump as "sound and free from pain," and its length as "one inch and three-fourths from the patella." The pensioner was paid March 4, 1875. He is reported as having died since that date.

Examples of Fatal Primary Amputations in the Upper Third of the Leg. Two hundred and forty-nine cases of amputation in the upper third of the leg were performed on two hundred and forty-eight patients, in one instance both legs having been primarily amputated in the upper third:

CASE 728.—Private J. H. Metz, Co. G, 9th Regiment Veteran Reserve Corps, aged 33 years, was wounded in the left leg, near Fort Stevens, Defences of Washington, July 11, 1864. Surgeon O. A. Judson, U. S. V., made the following report of the injury: "A conoidal ball entered the limb anteriorly, passed through transversely, and produced a compound comminuted fracture at the upper third of the tibia, the man by his weight soon after fracturing the fibula. He was conveyed to Carver Hospital, Washington, where the leg was amputated at the upper third, by the lateral flap method, by Medical Inspector J. Wilson, U. S. A., on the day of the injury. The patient was anæmic and very nervous at the time of the operation. Cold-water dressings were applied. On the following day the clot had formed beneath the flaps, rendering it necessary to cut the suture and reopen the wound. The clot was then turned out and the flaps, after remaining open for some time, were closed up again. On July 13th, the flaps looked dark and were opened again, when a strong solution of sulphate of copper was applied. Sloughing commenced the next day, causing the tibia to protrude. Citrate of iron and quinine, with stimulants, were administered freely and the external applications repeated. By July 17th granulations were starting up over a portion of the surface of the flaps. Secondary hæmorrhage occurred on the following day. The patient appeared greatly exhausted, had very poor appetite, and was troubled with diarrhœa. Dry dressings were now applied to the stump. On July 23d an abscess was found to have formed above the knee, after which sloughing extended upwards. The patient continued to sink, his diarrhœa resisting all treatment; pulse rapid; skin of an icteric tinge. Death occurred from exhaustion, July 28, 1864. At the autopsy pus was found to have burrowed up the outer and posterior portion of the leg, extending to the dorsum of the ilium. The pus was of a dark color and contained a large quantity of free fat. The right lung adhered to the wall of the chest anteriorly, otherwise healthy. Both lobes of the left lung were slightly congested; heart normal; liver somewhat congested and gall-bladder distended with bile; spleen covered on lower portion with patches of lymph; stomach distended with dark fluid. The mucous membrane of the small intestine was thickened and covered with pseudo-membrane, easily removable." The amputated bones of the leg (*Spec.* 3166), represented in the wood-cut (FIG. 285), were contributed to the Museum by Acting Assistant Surgeon A. W. Merrill.

FIG. 285.—Fracture of left tibia and fibula in upper third. *Spec.* 3166.

CASE 729.—Private G. Kronmiller, Co. C, 14th New York Heavy Artillery, aged 38 years, was wounded before Petersburg, July 9, 1864, and admitted to the field hospital of the 1st division, Ninth Corps. Surgeon M. K. Hogan, U. S. V., reported: "Fracture of left tibia by minié ball; leg amputated at junction of upper and middle thirds by Surgeon T. F. Oakes, 56th Massachusetts." The wounded man was sent to the Depot Hospital at City Point the day following the injury, and two weeks later he was transferred to Philadelphia. Acting Assistant Surgeon R. J. Levis recorded the following result of the case: "The patient was admitted to South Street Hospital on July 26th. He stated that he reacted tolerably well after the amputation was performed, but felt weak from diarrhœa and previous loss of blood. At the time of his admission the tibia was exposed nearly two inches anteriorly, caused by the sloughing of the flaps. The granulations were healthy, but his condition was weak. On August 3d, his general condition was much improved and the granulations were apparently extending themselves over a portion of the bone, which, however, was black in color. Some days afterwards the patient was attacked with diarrhœa, and on August 16th the parts showed some disposition to slough, when diluted creasote and afterwards Labarraque's solution was applied. By August 20th the diarrhœa had changed into dysentery; general condition weak; pulse 100 to 110 and feeble; some enlargement of liver, and icteroid complexion. On August 30th the sloughing had ceased and the diarrhœa was relieved; but the patient had cough, dulness and crepitation being heard over the inferior portion of the right lung. This condition continued nearly the same for some days, expectoration being more free and the diarrhœa again increasing for a time. By September 20th the stump was gradually healing, excepting where the bone protruded. October 3d, liver less large; subcrepitant rales in lower portion of right lung posteriorly up to the middle of the base of the scapula; rales heard in left lung posteriorly also, but no change in resonance. In this manner the patient remained, with occasional improvements, until October 7th, when the diarrhœa

increased much and he began to sink gradually. Death occurred on October 8, 1864. The autopsy showed the lower lobe of the right lung partly solidified and studded with unsoftened tubercles. The rest of the posterior right lung was congested and filled with frothy exudation; left lung congested and likewise filled with frothy liquid. In the anterior lower lobe a small abscess was found containing about a drachm of pus; the anterior portions of both lungs were mostly respirable. The liver was somewhat enlarged and undergoing fatty degeneration; spleen congested and enlarged. The lower part of the colon showed evidence of chronic inflammation, the mucous membrane being dark, thickened, and degenerated. This condition diminished higher up, but in no part was the colon healthy. Part of the ilium was inflamed; mucous coat of stomach much thickened but not inflamed." The upper part of the amputated tibia, exhibiting the seat of the fracture, was contributed to the Museum by Surgeon H. Ludington, 100th Pennsylvania, and constitutes specimen 6529 of the *Surgical Section*.

In one of the two hundred and forty-nine fatal cases of primary amputation in the upper third of the leg the operation was followed by exarticulation at the knee joint, and in nine by amputation in the thigh:[1]

CASE 730.—Private B. G. Waters, Co. H, 19th Maine, aged 19 years, was wounded at Petersburg, October 15, 1864. Surgeon I. Scott, 7th West Virginia, reported that "he entered the field hospital of the 2d division, Second Corps, with shot fracture of leg, caused by a minié ball, for which Surgeon W. J. Burr, 42d New York, performed amputation." Surgeon E. Bentley, U. S. V., reported the following result of the case: "The patient was admitted to Baptist Church Hospital at Alexandria six days after being wounded. His left leg had been amputated at the upper third by anterior and posterior flaps on the day of the injury. When admitted his general health was fair, although he complained of considerable pain and required opiates to procure sleep. The integument over the spine of the tibia was black and had commenced to slough. This continued until the ends of both bones were exposed and the stump around presented a large mass of sloughing tissue. Stimulating lotions were applied and some improvement followed; all sloughing ceased and granulations commenced; but the granulations were pale and flabby, the edges of the integument everted, and the patient suffered excessive pain. On November 18th, sloughing reappeared and extended rapidly towards the popliteal region. He was also troubled some with diarrhœa, having about four passages daily. He was daily growing weaker from suffering and loss of appetite, and the stump became so painful that he would cry out frequently, complaining of spasmodic twitching. Taking these circumstances and the danger of secondary hæmorrhage into consideration, the limb was reamputated in the lower third of the femur (see TABLE XL, No. 200, p. 323, *ante*) on November 24th, by Assistant Surgeon W. A. Harvey, U. S. V., who used sulphuric ether as the anæsthetic and performed the operation by the circular method. Three days after the operation the patient's appetite had improved and he could sleep well, was more cheerful, and complained of but little pain. No union had yet taken place in the stump, but suppuration had commenced. On December 7th, when transferred to Prince Street Hospital, he was still doing well.". The subsequent records show the patient died of exhaustion April 25, 1865. The stumps of the tibia and fibula, removed at the second amputation, together with portion of the popliteal vein, external and internal popliteal nerves, were contributed to the Museum by Surgeon E. Bentley, and constitute specimens 3445, 3446, 3447, and 3448, respectively, of the *Surgical Section*.

In the next case hæmorrhages from the stump occurred twenty-four days after the operation. The patient died from exhaustion four days later:

CASE 731.—Private G. Hoasch, Co. E, 110th Ohio, aged 45 years, was wounded in the left leg, at Monocacy, July 9, 1864, and admitted to hospital at Frederick the following day. Assistant Surgeon R. F. Weir, U. S. A., reported: "The injury was produced by a minié ball, which fractured both bones at the lower third. The leg was removed on July 11th, at the upper third, by the circular method, by Acting Assistant Surgeon W. S. Adams. At the time of the operation the patient's condition was very poor from diarrhœa and the fatigue of marching; the leg swollen, sloughing, and threatened by gangrene. On July 20th there was slight sloughing of the flaps, and yeast poultices were applied. On the following day the slough was carefully trimmed away with scissors, and permanganate of potassa was applied in full strength by means of a mop, after which the end of the stump was covered with oakum wet with a dilution of the permanganate of potassa, and the whole enwrapped with oiled silk. On July 25th the slough came away nicely and a good granulating surface was found beneath it; general condition of patient slightly improved. Hæmorrhage occurred at 1 A. M. on August 4th, and another at 5 A. M., when thirty-two ounces of blood were lost. Bleeding was controlled by the application of a tourniquet before the attending medical officer arrived, and no attempt to ligate was made. At 9 A. M. the patient was found with his extremities cold and pulseless, and when the tourniquet was removed the bleeding had ceased. Stimulants were then ordered to be given freely and a hot-air bath, a nurse being placed by the side of the bed to watch the stump. At 11 A. M., a slight oozing was observed from the posterior tibial, which was drawn out and ligated. On the morning of August 6th the ligature came away during the dressing of the stump; the patient had not yet rallied from the attack of hæmorrhage; treatment continued. The patient died of exhaustion on August 8, 1864. An examination of the stump showed total absence of the clot in the cut extremities." The amputated bones of the leg, exhibiting a bad comminution throughout the lower third of the tibia and a transverse fracture in the fibula, were contributed to the Museum by the operator, and constitute specimen 3829 of the *Surgical Section*.

---

[1] The limb was subsequently amputated at the knee joint in the case of Pt. C. Rhinehart, K, 74th Pennsylvania (TABLE LVI, CASE 42, p. 407); intermediary operation. Amputation in the thigh was performed in the following 9 cases: Pt. G. Tompkins, G, 1st N. Y. Battery, intermediary operation in upper third of thigh (TABLE XXXIV, No. 137, page 277); Pt. W. L. Hindman, E, 155th Pennsylvania, secondary operation in middle third of thigh (TABLE XXXIX, No. 125, page 315); Pt. *L. Winters*, K, 50th Georgia, secondary operation in middle third of thigh (TABLE XXXIX, No. 166, page 316); Corp'l H. G. Brown, B, 37th Wisconsin, secondary operation in middle third of thigh (TABLE XXXIX, No. 108, page 315); Pt. O. M. Corey, H, 114th New York, intermediary operation, lower third of thigh (TABLE XXXVI, No. 286, page 297); Pt. E. De Hoff, H, 38th Ohio, secondary operation, lower third of thigh (TABLE XL, No. 127, page 321); Pt. H. E. Eldred, E, 2d U. S. S. S., intermediary operation, lower third of thigh (TABLE XXXVI, No. 327, page 298); Pt. J. Morse, B, 2d Pennsylvania Heavy Artillery, intermediary operation, lower third of thigh (TABLE XXXVI, No. 502, page 300); Pt. B. G. Waters, H, 19th Maine, secondary operation, lower third of thigh. *Specs.* 3445, 3446, 3447, 3448 (TABLE XL, No. 200, page 323).

TABLE LXVIII.

Summary of One Thousand and Twenty-nine Cases of Primary Amputations in the Upper Third of the Leg for Shot Injuries.

[Recoveries, 1—771; Deaths, 772—1020; Result unknown, 1021—1029.]

No.	Name, Military Description, and Age.	Dates.	Operations, Operators, Result.
1	Abrams, A. J., Serg't, K, 9th N. Y. Heavy Artillery, age 33.	June 22, 22, '64.	Right; ant. post. flap. Surg. S. A. Sabin, 9th N. Y. H'vy Art'y. Disch'd Feb. 25, 1865.
2	*Adams, J. H.*, Pt., F, 3d Arkansas, age 21.	July 2, 2, '63.	Left. Surg. — Rouch, C. S. A. Paroled Nov. 12, 1863.
3	*Adams, W.*, Pt., D, 7th South Carolina, age 38.	May 16, 16, '64.	Right. Furloughed July 28, '64.
4	Alkin, A. S., Serg't, K, 18th Indiana, age 27.	July 20, 20, '64.	Left: flap. Disch'd Mar. 13, '65.
5	*Allen, J. W.*, Pt., King William Artillery.	Sept. 14, 14, '63.	——. Surg. — Robertson. Recovery.
6	Allen, L. F., Pt., I, 35th New York.	Dec. 13, 13, '62.	Left. Discharged June 6, 1863.
7	Andrews, A., Pt., G, 27th Ohio, age 39.	July 3, 3, '63.	Right. Discharged Jan. 11, 1864.
8	*Andrews, J. N.*, Serg't, F, 5th Ala., age 29.	July 1, 1, '63.	Left; circular. Exchanged Sept. 25, 1863.
9	Andrews, O. T., Lieut., C, 15th Illinois.	April 6, 8, '62.	Right. Discharged August 21, 1862.
10	Andrus, C. E., Pt., K, 106th Penn., age 20.	June 3, 3, '64.	Left; circ. Surg. M. Rizer, 72d Penn. Disch'd Dec. 28, 1864.
11	Aney, T. L., Pt., K, 56th Penn., age 18.	July 1, 3, '63.	Right; circular. Disch'd Jan. 17, 1865.
12	Arnell, J., Pt., B, 14th Iowa, age 19.	April 30, 30, '64.	Right; flap. Discharged Nov. 15, 1864.
13	Ayers, J. M., Pt., F, 76th Pennsylvania.	July 11, 13, '63.	Left; circ. Mustered out Nov. —, 1864.
14	*Bagwell, N. B.*, Serg't, B, 38th Georgia.	Sept. 17, 19, '62.	Left. Union surgeon. Retired Dec. 30, 1864.
15	Barrett, F. J., Corp'l, D, 59th New York.	May 3, 4, '63.	Right; flap. A. Surg. W. J. Burr, 59th N. Y. Disch'd April 18, '64.
16	Barron, W., Serg't, B, 2d Corps d'Afrique, age 24.	April 9, 9, '63.	Right; post. flap. Disch'd Oct. 5, 1863. *Spec.* 1420.
17	Bartholomew, G., Corp'l, D, 67th Penn., age 23.	Sept. 19, 19, '64.	Left; flap. Disch'd June 1, 1865. Died Nov. 14, 1867.
18	Bartlett, J., Pt., G, 5th N. Y. H'vy Artillery, age 20.	Oct. 19, 19, '64.	Right; lateral flap. Confederate surgeon. Disch'd July 4, 1865. *Spec.* 3092.
19	Basine, C., Pt., H, 8th Penn. Res., age 20.	Sept. 17, 17, '62.	Right. Discharged Dec. 6, 1862; gang. Dec., 1862, amp. thigh. 1870, stump sound.
20	Battelle, C. P., Serg't, A. 59th Mass., age 20.	Mar. 25, 25, '65.	Left; ant. post. flap. Discharged July 13, 1865.
21	Baughman, J., Pt., M, 5th Col'd Cavalry, age 20.	Aug. 15, 15, '64.	Right; flap. Surg. G. W. Bowen and A. Surg. J. Swan, 5th Col'd Cavalry. Disch'd Feb. 15, 1865.
22	Beach, J. (alias Smith), Pt., D, 28th Mass., age 20.	Mar. 25, 25, '65.	Left; circular. Surg. M. C. Rowland, 61st N. Y. Disch'd July 15, 1865.
23	*Bean, W. H.*, Pt., K, 8th North Carolina, age 26.	June 17, 17, '64.	Left; circular. Furloughed Sept. 16, 1864.
24	Beardsley, W. W., Pt., H, 82d Ohio.	Aug. 29, 30, '62.	R't; flap. A. Surg. A. W. Munson, 82d Ohio. Disch'd Nov. 3, 1862.
25	Beaumont, S., Capt., E, 29th Penn., age 26.	Dec. 17, 17, '64.	Left; circ. Surg. J. A. Wolf, 29th Penn. Must. out July 11, 1865.
26	Beeson, W. H., Pt., G, 82d Penn., age 22.	June 1, 2, '64.	Right; flap. Disch'd July 20, 1865. Died Jan. 3, 1870.
27	Berschig, A., Pt., A, 23d Ohio, age 20.	Sept. 22, 22, '64.	Left; ant. post. flap. Discharged Jan. 5, 1865.
28	Bierce, P., Pt., A, 1st Ohio Artillery, age 20.	Nov. 13, 13, '63.	Left; flap. Dec. 25, amp. arm. Disch'd August 29, 1864.
29	*Bigby, W. A.*, Pt., K, 1st South Carolina.	June 27, 27, '62.	Right. Surg. — Evans, C. S. A. Disch'd August 6, 1864.
30	Bingenheimer, C., Corp'l, A, 33d Wis., age 30.	Mar. 30, 30, '65.	Left; flap. Surg. J. W. Green, 95th Ill. Disch'd June 20, 1865.
31	*Bird, S. A.*, Pt., G, 12th South Carolina, age 26.	July 1, 2, '63.	Right. Exchanged Nov. 12, '63.
32	*Black, L. C.*, Lieut., F, 12th Georgia, age 21.	Sept. 19, 19, '64.	Left. Surg. J. M. Lawson, 30th N. C. To prison Dec. 9, 1864.
33	Blake, C. A., Pt., C, 14th New Jersey, age 24.	Oct. 19, 19, '64.	Right; ant. post. flap. Disch'd July 7, 1865.
34	Blomley, A., Corp'l, A, 91st Penn., age 27.	June 18, 20, '64.	Right; circ. Surg. J. Kerr, 62d Penn. Disch'd Sept. 27, 1864.
35	*Bobo, J. E.*, Pt., E, Holcomb's Legion, age 18.	Mar. 29, 29, '65.	Right; circ. Released June 14, 1865.
36	Bodwell, J., Serg't, G, 71st Ohio, age 22.	Dec. 15, 15, '64.	Right; ant. post. flap. Surg. D. C. Patterson, 124th Ohio. Discharged May 12, 1865.
37	*Bohannan, J. W.*, Corp'l, G, 8th Georgia, age 24.	Aug. 14, 14, '64.	Left; double flap. Released June 28, 1865.
38	*Boon, W. J.*, Pt., A, 5th North Carolina, age 27.	May 3, —, '63.	——. Furloughed July 23, 1863.
39	Bornman, J. M., Corp'l, I, 61st Penn., age 28.	Sept. 22, 22, '64.	Right (also w'd left leg and hand); flap. Surg. G. R. Lewis, 61st Penn. Disch'd July 21, 1865.
40	*Bonner, N. J.*, Pt., I, 33d Mississippi, age 22.	July 10, 11, '64.	Left; circular. Provost Marshal March 7, 1865.
41	Bouch, W. B., Pt., B, 139th Penn., age 24.	Sept. 21, 22, '64.	Left; ant. post. flap. Surg. E. R. Umberger, 93d Penn. Disch'd July 11, 1865.
42	Bovee, J. N., Pt., E, 18th New York, age 19.	June 27, 29, '62.	Right. Confed. surgeon. Discharged Sept. 15, 1862.
43	Boyle, J., Pt., G, 34th Mass., age 20.	Oct. 13, 14, '64.	Right. Disch'd March 18, 1865.
44	Bradley, H., Corp'l, Ordnance Depart., U.S.A., age 34.	Aug. 9, 9, '64.	Left; circ. Surg. W. O Meagher, 69th N. Y. Disch'd May 31, '65. (Also wound of left foot.)
45	Bradley, L. F., Corp'l, I, 8th Conn., age 22.	Sept. 29, 29, '64.	Left; flap. Disch'd Oct. 8, 1865.
46	Bradley, P., Pt., E, 164th New York, age 38.	June 16, 16, '64.	Left; ant. post. flap. Discharged July 31, 1865. *Spec.* 257. Died July 30, 1870.
47	Brady, J., Capt., G, 26th Massachusetts, age 33.	Sept. 19, 20, '64.	Left. Surg. J. G. Bradt, 26th Mass. Disch'd Dec. 31, 1864.
48	Branch, E. B., Pt., D, 77th N. York, age 20.	May 3, 3, '63.	Left; circ. Surg. G. T. Stevens, 77th N. Y. May 17, '64, re-amp. leg. Disch'd Sept. 20, 1864.
49	Brandenberg, A., Serg't. H, 6th Maryland.	April 2, 2, '65.	Right; circ. Surg. E. K. Foreman, 6th Maryland. Disch'd July 13, 1865.
50	Brannan, J., Pt., C, 44th New York, age 26.	July 2, 4, '63.	Right; flap. July 12, hæm.; post. tibial lig.; 15th, hæm.; femoral ligated. Recovery.
51	[1]Brannan, M., Corp'l, B, 9th Mass., age 30.	June 3, 4, '64.	Right; dou. skin flap. A. Surg. J. Ryan, 9th Mass. Disch'd August 20, 1864.
52	Breen, J., Pt., B, 15th Connecticut.	Dec. 13, 13, '62.	Right. Discharged June 18, '63.
53	Breeze, S., Pt., C, 76th Penn., age 45.	Aug. 16, 16, '64.	Left; flap. Disch'd Nov. 29, '64. Died of prostration August 11, 1869.
54	Brest, J. P., Pt., E, 100th Penn., age 24.	June 2, 3, '64.	Left; ant. post. flap. Surg. H. Ludington, 100th Penn. Discharged May 6, 1865.
55	Bridge, J., Pt., K, 57th New York, age 20.	May 3, 3, '63.	Right; circ. Surg. C. S. Wood, 66th N. Y. Gangrene. Disch'd Sept. 24, 1863.
56	*Bridges, J. W.*, Pt., K, 6th Georgia, age 24.	Aug. 19, 20, '64.	Left; lat. flap. To prison March 28, 1865.
57	Briggs, H. E., Pt., G, 3d Wisconsin.	Sept. 17, 17, '62.	Right. Discharged Dec. 27, '62.
58	*Brith, J. H.*, Surgeon, 1st Missouri.	June 9, 9, '63.	——. Surg. B. D. Lay, C. S. A. Recovered.
59	Britten, W. B., Serg't, F, 60th Ohio, age 23.	June 17, 17, '64.	Left; flap. Surg. W. B. Fox, 8th Mich. Disch'd Jan. 10, 1865.
60	Britton, J., Serg't, H, 18th Massachusetts.	Sept. 30, 30, '64.	Left; double flap. Disch'd Aug. 21, 1865.
61	Brockham, A., Pt., E, 58th Penn., age 47.	Sept. 29, 29, '64.	Left; post. flap. Disch'd June 27, 1865.
62	Broderick, J., Pt., D, 36th New York.	May 3, 3, '63.	Right; circ. Surg. C. N. Chamberlain, U. S. V. Disch'd Aug. 7, 1863.
63	Brondstetter, W., Pt., G, 9th N. Jersey, age 21.	Dec. 16, 16, '62.	Left; double flap. Surg. G. A. Otis, 27th Mass. Disch'd Jan. 21, 1864.
64	Brown, H., Pt., K, 22d Col'd Troops, age 19.	July 30, 30, '64.	Right. March 19, 1865, amp. left thigh. Disch'd Mar. 20, 1865.
65	Brown, M., Pt., E, 99th Ohio, age 20.	Aug. 6, 7, '64.	Left. Surg. A. M. Wilder, U. S. V. Nov. 14, re-amp. Mustered out May 30, 1865.
66	Bruback, D., Pt., B, 1st Penn. L. Art'y, age 21.	June 30, J'y 1, '62.	Right. Confed. surgeon. Discharged Dec. 3, 1862.
67	Bryan, D. M., Pt., B, 84th Penn., age 19.	Oct. 27, 28, '64.	Left; flap. Disch'd Sept. 2, '65.
68	Buckner, R., Pt., G, 16th New York H'vy Art'y, age 43.	Aug. 13, 13, '64.	Right; ant. post. flap. Disch'd Nov. 17, 1864. Died March 3, 1865; inflammation of stump.
69	Bullett, J., Pt., C, 13th Col'd Troops, age 24.	Dec. 16, 16, '64.	Right; flap. A. A. Surg. J. S. Giltner, U. S. A. Disch'd July 15, 1865.
70	Bumm, J., Pt., F, 29th Pennsylvania, age 20.	June 15, 15, '64.	Right; flap. Surg. J. A. Wolf, 29th Penn. Disch'd Aug. 4, '65.
71	*Burk, J.*, Pt., F, 38th Georgia, age 23.	Feb. 6, 7, '65.	Right; circular. To prison June 8, 1865.
72	Burnett, J., Pt., D, 107th New York, age 24.	May 3, 5, '63.	Right; circ. Disch'd Sept. 18, '63.
73	Burrell, J., Pt., K, 9th New Jersey.	Feb. 8, 8, '62.	Left. Surg. L. Braunn, 9th New Jersey. Disch'd Aug. 18, 1862.
74	Byers, A. F., Pt., H, 1st Tennessee.	Jan. 6, 6, '65.	Right; circular. Disch'd May 26, 1865.
75	*Byrne, J.*, Pt., F, 11th North Carolina.	July 3, 5, '63.	Left. Surg. — White, C. S. A. Recovered.
76	*Cadon, Z. P.*, Pt., E, 11th Virginia, age 26.	July 2, 3, '63.	Left. Union surgeon. Exch'd Nov. 12, 1863.

Primary Amputations in the Middle Third of the Leg for Shot Injury.—Eight hundred and ninety-two of the three thousand three hundred and ninety-five primary amputations in the continuity of the bones of the leg were performed in the middle third. The result in six of these cases was not determined; seven hundred and thirty-six proved successful, and one hundred and fifty were fatal, a mortality of 16.9 per cent., or 7.5 per cent. less than that of the primary ablations in the upper third of the leg.

Examples of Successful Primary Amputations in the Middle Third of the Bones of the Leg.—The operations of this group numbered seven hundred and thirty-six; one hundred and fifty-five were performed on Confederate and five hundred and eighty-one on Union soldiers. Of the latter the names of five hundred and seventy-six are found on the Pension Rolls; two are retired officers, and three do not seem to have applied for pensions. Twenty-seven have died since the date of their discharge from the service—one of erysipelas, one of epilepsy, one of congestion of the brain, seven of phthisis, three of accidents, and fourteen of causes not stated.

FIG. 286.—Bony stump of right leg, five months after amputation. *Spec.* 4225.

CASE 732.—Private D. S. Crawford, Co. A, 47th Pennsylvania, aged 20 years, was wounded at Cedar Creek, October 19, 1864, and admitted to Camden Street Hospital, Baltimore, one week afterwards. Assistant Surgeon G. M. McGill, U. S. A., contributed the pathological specimen shown in the adjoining wood-cut (FIG. 286), with the following description: "The patient had received a shot fracture of the right leg at the lower third, for which amputation was performed the same day at the middle third. Necrosis of the stump of the tibia ensued to the extent of several inches, necessitating resection, which was performed by Acting Assistant Surgeon W. G. Smull on March 24, 1865, chloroform being used and the operation performed by lateral flaps. The patient did very well afterwards. The upper portion of the stump healed by first intention." The patient was subsequently transferred to Jarvis Hospital, where he was discharged from service May 31, 1865, and afterwards supplied with a "Palmer" artificial leg. His pension was paid June 4, 1880. In his applications for commutation he described the condition of the stump as "continuing good." The specimen, No. 4225, *Surgical Section*, A. M. M., consists of bones of the stump, removed at the second operation, and measuring five inches in length. A large sequestrum extends the entire length, embraced by an involucrum, which is wanting on the anterior border; and the fibula, well rounded, has joined its extremity to the tibia.

CASE 733.—Private D. Jerman, Co. F, 190th Pennsylvania, aged 23 years, was wounded before Petersburg, July 11, 1864. He was admitted to the field hospital of the 3d division, Fifth Corps, whence Surgeon L. W. Read, U. S. V., reported: "Severe wound, with fracture of right leg, caused by a solid shot, and followed by amputation at middle third." The operation was performed by the flap method. From the field the patient was transferred to City Point, thence to Beverly Hospital, and subsequently he passed through various hospitals in Philadelphia, where he was supplied with a "Palmer" artificial leg. On August 7, 1865, he was discharged from service and pensioned. In his subsequent application for commutation for an artificial limb he represented the stump as being "sore occasionally," and mentioned Surgeon L. W. Read, U. S. V., as the operator. The pensioner died May 9, 1880, his attending physician certifying that "the stump of the limb was diseased and in an ulcerating condition, resulting in his death." The colored lithograph opposite (PLATE LXXVI) is a copy of a drawing by Hospital Steward E. Stauch, made immediately after the amputation, and shows the comminution of the bone, and especially the terrible laceration of the soft parts, caused by the missile, a solid shot.

UNIVERSITY

CASE 734.—Private F. W. Knight, Co. E, 11th Vermont, aged 21 years, was wounded in the right leg, at Winchester, September 19, 1864, by a minié ball, which passed through the ankle joint. He was conveyed to the Depot Hospital of the Sixth Corps, where amputation was performed but not recorded. Surgeon F. V. Hayden, U. S. V., noted the following history: "The wounded man was admitted to Sheridan Hospital, Winchester, October 5th, with amputation of the right leg at middle third, performed the day after the injury by Surgeon W. A. Barry, 98th Pennsylvania, the flap method being used, with circular section of the muscles. Erysipelas appeared a few days after the operation. One and a half inches of protruding bone was removed on October 10th. The treatment consisted of stimulants and tonics, including quinine, etc." On December 5th, the patient was transferred to Frederick Hospital, and two weeks later to Central Park, New York City, whence Acting Assistant Surgeon S. Teats contributed the specimen, No. 4330, *Surgical Section*, A. M. M., represented in the annexed cut (FIG. 287), with the following result of the case: "The stump became painful and tender, its end cold and bluish in appearance, and a circular exuberant ulcer formed in the cicatrix. On February 15, 1865, chloroform was administered and re-amputation was performed by the circular method by Surgeon B. A. Clements, U. S. A. Sutures, adhesive straps, and water dressings were applied after the operation. The result was favorable and the stump healed." The patient was discharged from service August 17, 1865, and pensioned, having been previously furnished with an artificial leg by Dr. E. D. Hudson, of New York City. In his applications for commutation the pensioner reported the stump as remaining in "good condition." His pension was paid March 4, 1880. The specimen consists of the re-amputated stumps of the tibia and fibula, showing an excellent deposit of callus but being carious internally.

FIG. 287.—Bony stump of the left leg, five months after amputat'n. *Spec.* 4330.

FIG. 288.—Stump after antero-posterior flap amputation. *Spec.* 4305.

CASE 735.—Private J. Shaud, Co. K, 93d Pennsylvania, aged 26 years, was wounded at Fair Oaks, May 31, 1862. He was conveyed to White House Landing and thence by transport steamer to New Haven, Connecticut. Surgeon P. A. Jewett, U. S. V., in charge of Knight Hospital, recorded the wounded man's admission, June 9th, with "amputation of leg," and reported that he recovered and was transferred to New York City January 19, 1864, "to be furnished with a wooden leg." Surgeon B. A. Clements, U. S. A., reported that the patient was discharged from service at Central Park Hospital March 9, 1864, by reason of "loss of right leg by primary amputation, performed for shot fracture involving the ankle joint." A cast of the stump (*Spec.* 4305, *Surgical Section*, A. M. M.), showing the cicatrix to be located on the anterior face above the extremity, was contributed by Acting Assistant Surgeon G. F. Shrady, and is shown in the adjoining wood-cut (FIG. 288). Dr. E. D. Hudson, of New York City, who supplied the pensioner with an artificial leg before he left the hospital, described the stump as having been formed by an "antero-posterior flap amputation at the junction of the middle and lower thirds" of the limb. The pensioner was paid June 4, 1880. He reports the condition of the stump as remaining sound and healthy.

In the following instance both legs were successfully amputated at the middle thirds one day after the injury:

CASE 736.—Private *E. B. Higginbotham*, Co. F, 38th Georgia, appears recorded on a Confederate hospital register as having had "both legs fractured by gunshot, at Spottsylvania Court House, May 12, 1864," for which "both limbs were amputated at the middle third by Surgeon W. J. Arrington, P. A. C. S., on the following day." The man recovered, and was subsequently furnished with artificial legs by the Confederate Association for the relief of maimed soldiers.

Fatal Primary Amputations in the Middle Third of the Bones of the Leg.—The one hundred and fifty operations of this group were performed on twenty-two Confederate and one hundred and twenty-eight Union soldiers. Exhaustion, pyæmia, and gangrene were reported as the principal causes of death.

CASE 737.—Private E. J. Valleley, Co. A, 3d Rhode Island Artillery, aged 18 years, was wounded by the explosion of the magazine of the Gunboat "George Washington," near Beaufort, S. C., April 10, 1863. His injuries comprised two scalp wounds of no great importance, a compound fracture of the upper fifth of the right ulna, a fracture of the right femur at its middle, and compound comminuted fracture of the bones of the right leg and foot. There was most alarming nervous depression. Stimulants and nourishment were liberally supplied, but no decided reaction followed. Forty-eight hours after the receipt of the injuries it was thought best to amputate the leg, which operation was performed at the middle third on April 12th. After the operation the thigh continued to swell till it reached an enormous size, which circumstance gave reason to believe that the femoral artery had been ruptured by the fractured ends of the femur. The patient was delirious a good part of the time after the operation. He died on the morning of April 14, 1863. There was no attempt at union in the incisions that were made for the removal of the limb, and the stump had an unhealthy look, the discharge being of an ashy color and pasty consistence. For two days before he died he was isolated from the other wounded patients. After death a large quantity of bloody serum was found in the cellular tissue of the thigh; the artery and vein were entire in their whole length. The lower fragment of the femur was pushed up behind the lower end of the upper fragment, denuding the latter of its periosteum for more than three inches. The amputated portions of the tibia and fibula were found to be both broken at the junction of the malleoli with these bones, the tibia being stripped of periosteum for about four inches upward from the joint. The fibula was also broken about three inches above the joint. The posterior end of the os-calcis was broken off, and this bone was extensively fissured and otherwise injured; the cuboid bone was comminuted. The wound in the soft parts was about four inches long, running upward from the superior surface of the astragalus on the inner side of the leg, and the tibia protruded some two inches. The history, together with the specimen (No. 1165, *Surg. Sect.*, A. M. M.), consisting of the amputated bones of the leg, was contributed by Surgeon F. L. Dibble, 6th Connecticut.

CASE 738.—Brigadier General G. W. Taylor, U. S. V., was wounded in the left leg, at Bull Run, August 27, 1862. The character of the injury and its result was reported by Assistant Surgeon J. B. Brinton, U. S. A., as follows: "A ball entered at the inner edge of the tibia, about six inches above the internal malleolus, passed directly through and comminuted the bone very badly for about six inches above and below, making two openings of exit on the anterior and outer aspect of the leg about five inches above the external malleolus. The patient was admitted into the Mansion House Hospital, Alexandria, thirteen hours after the reception of the injury, where Surgeon J. H. Brinton, U. S. V., amputated the limb by the double flap method at the middle third. The operation was performed twenty-six hours after the reception of the injury, the patient losing considerable blood and all the vessels requiring ligation. He had been with the army through the Peninsular campaign and his blood appeared to be very much vitiated by morbific influence of malaria. After the amputation it was discovered, what was previously suspected, that the fibula was not broken by the force of the ball, but by the weight of the patient coming upon it suddenly when the support from the tibia was destroyed by its fracture. The patient's arterial system did not fully react; his pulse, which was feeble, tremulous, and very irregular at times, evidently denoted a depraved condition of the system. He refused to take stimulants except sparingly. This condition continued until September 1, 1862, when he died at 4 o'clock A. M. He was under the influence of chloroform during the operation." The amputated parts of the tibia and fibula (*Spec.* 313, *Surg. Sect.*, A. M. M.), represented in the wood-cut (FIG. 289), were contributed to the Museum by the operator.

FIG. 289.—Left tibia fractured by a musket ball; fibula fractured by the subject's weight suddenly coming upon it.—*Spec.* 313.

CASE 739.—Lieutenant C. J. Sergeant, Co. F, 7th Iowa, aged 31, was wounded in the left leg, during the siege of Atlanta, August 11, 1864. Surgeon J. M. Woodworth, 1st Illinois Light Artillery, described the injury as an "extensive fracture of both bones of the leg, produced by a musket ball, for which amputation was performed on the same day by Surgeon W. R. Marsh, 2d Iowa, at the field hospital of the 2d division, Sixteenth Corps." Five days after the date of the injury the patient was moved to the field hospital at Marietta, and two months later he was transferred to Chattanooga, thence to Nashville, and later to the Officers' Hospital at Louisville. Surgeon F. Greene, U. S. V., in charge of the latter, described the amputation to have been performed by the "antero-posterior flap method at the middle third," and reported that "for a month after the operation oozing of blood continued from the stump, the patient's condition being feeble. Gangrene supervened in the latter part of September, chiefly attacking the anterior flap. The bone became necrosed, and in October two pieces were removed and the gangrene controlled." The patient was lastly admitted to Grant Hospital, Cincinnati, where he obtained a leave of absence on December 12th. He died at his home in Ottumwa, Iowa, April 10, 1865, his attending physician, Dr. J. C. Hinley, certifying that "his disease was pyæmia, being caused by the amputation of one of his lower extremities, the stump of which never healed."

TABLE LXIX.

Summary of Eight Hundred and Ninety-two Cases of Primary Amputations in the Middle Third of the Leg for Shot Injuries.

[Recoveries, 1—736; Deaths, 737—886; Results unknown, 887—892.]

NO.	NAME, MILITARY DESCRIPTION, AND AGE.	DATES.	OPERATIONS, OPERATORS, RESULT.	NO.	NAME, MILITARY DESCRIPTION, AND AGE.	DATES.	OPERATIONS, OPERATORS, RESULT.
1	Abbott, F. A., Pt., K, 7th N. Hampshire, age 38.	May 16, 17, '64.	Left; double flap. Mustered out December 22, 1864.	17	*Bailey, D.*, Pt., D, 7th S. Carolina Bat'ry, age 44.	Aug. 21, 21, '64.	Right. Provost Marshal April 1, 1865.
2	Ackerman, J. H., Pt., C, 31st Iowa, age 24.	Jan. 11, 11, '63.	Left; flap. Surg. G. L. Carhart, 31st Iowa. Disch'd April 13, '63.	18	Baird, J. N., Corp'l, A, 34th Illinois.	April 7, 9, '62.	Left. Discharged.
3	Allen, B. F., Pt., F, 120th New York, age 20.	Nov. 2, 2, '64.	Left; flap. Surg. H. A. Reynolds, 1st Me. H'vy Art'y. Recovery. April 9, 1870, stump good.	19	*Baird, J. T.*, Lieut., C, 16th Virginia, age 31.	Aug. 19, 20, '64.	Left; circular; gangrene. Transferred Nov. 9, 1864.
4	Alt, M., Pt., F, 26th Missouri.	May 16, 17, '63.	Right; circ. Surg. J. S. Prout, 26th Missouri. Gang.; erysip. Disch'd Oct. 21, 1863.	20	Baldis, J., Pt., C, 39th New York, age 27.	July 2, 2, '63.	Left; ant. post. flap. Surg. F. Wolf, 39th N. Y. Discharged April 16, 1864.
5	Ambrose, R., Pt., F, 8th Conn., age 27.	May 7, 7, '64.	Right; flap. Surg. M. Storrs, 8th Conn. Disch'd May 7, 1865.	21	Ball, R. G., Serg't, D, 147th N. York, age 20.	Mar. 31, Ap. 1, '65.	Left; lateral flap. Surg. A. S. Coe, 147th New York. Disch'd August 2, 1865.
6	Anderson, J., Pt., K, 18th Missouri, age 20.	July 22, 22, '64.	Right; flap. Surg. A. B. Monohan, 63d Ohio. Disch'd Aug. 2, 1865.	22	*Ballentine, G. W.*, Pt., H, 14th Tennessee, age 25.	Oct. 1, 1, '64.	L't; oval flap. Surg. A. G. Emory, C. S. A. Retired Jan. 20, 1865.
7	Anderson, W., Pt., H, 5th Col'd Troops, age 18.	Sept. 29, 29, '64.	Left; circ. Surg. H. C. Merryweather, 5th Colored Troops. Disch'd May 8, 1865.	23	Barber, S. M., Capt., H, 42d Ohio.	May 22, 22, '63.	Right; flap. Surg. J. Pomerene, 42d Ohio. Disch'd Mar. 15, '64.
8	*Andrews, A. S.*, Capt., B, 2d North Carolina.	June 9, 9, '63.	——. Surgeon — Gill, C. S. A. Recovery.	24	Bates, C., Corp'l, G, 51st New York, age 23.	Sept. 17, 18, '62.	Left; ant. post. flap. Surg. W. H. Leonard, 51st N. Y. Disch'd January 17, 1863.
9	*Anglim, N. J.*, Pt., I, 24th Tennessee.	De. 31, '62, Jan. 2, '63.	——. Recovery.	25	Bates, O. W., Pt., M, 1st Me. H'vy Art., age 37.	April 6, 6, '65.	Right; flap. Discharged September 12, 1865.
10	*Apple, L.*, Pt., I, 1st Florida Cavalry, age 30.	Dec. 7, 8, '64.	Right; circ. Provost Marshal March 4, 1865.	26	Baum, F. W., Pt., C, 16th Missouri.	Nov. 25, 25, '63.	Left; circ. Surgeon R. J. Mohr, 10th Iowa. Disch'd Apr. 22, '64.
11	Armstrong, J. M., Pt., K, 13th Iowa.	July 21, 21, '64.	Left; flap. Surg. M. W. Thomas, 13th Iowa. Disch'd July 21, '65.	27	Baxter, W. H., Lieut., K, 113th Ohio, age 21.	June 27, 27, '64.	Right; flap. Discharged Dec. 29, 1864.
12	Ashlerman, J., Pt, B, 51st Ohio.	June 17, 18, '62.	Left; flap. Surg. M. C. Woodworth, 51st Ohio. Disch'd Feb. 23, 1863.	28	Bean, W. B., Pt., 7th Maine Bat'ry, age 27.	May 12, 12, '64.	Left; circ. Discharged September 5, 1864.
13	Augustine, F., Pt., I, 21st Wisconsin, age 21.	May 14, 14, '64.	Left; flap. Discharged. 1870, stump sound.	29	Beaton, D. P., Serg't, M, 2d Ohio Cav., age 21.	June 9, 10, '63.	Right; flap. Surg. W. H. McReynolds, 2d Ohio Cavalry. Disch'd Oct. 15, 1864.
14	Averill, J. B., Pt., E, 8th Vermont, age 23.	Sept. 19, 19, '64.	Right; circ. Surg. J. G. Thompson, 77th N. York. Gangrene. Disch'd Oct. 11, 1865.	30	Beatty, T., Pt., I, 4th N. York Artillery, age 39.	June 3, 3, '64.	Left; flap. Discharged January 26, 1864.
15	Babbitt, J. W., Pt., C, 24th Michigan.	July 1, 2, '63.	Right; flap. Surg. A. J. Ward, 2d Wis. Disch'd Nov. 6, 1863.	31	Bee, D. H., Pt., A, 61st Penn., age 25.	July 12, 12, '64.	Right; ant. post. flap. A. A. Surg. M. F. Price. M. O. Sept. 7, '64.
16	Bailey, A. W., Pt., A, 24th New York.	Sept. 14, 16, '62.	Left; flap. Disch'd Dec. 13, '62. Died October 11, 1867.	32	Beeman, G. W., Pt., K, 2d Conn. H. Art., age 20.	Oct. 19, 20, '64.	Right; circ. Surg. W. A. Barry, 98th Penn. Disch'd July 25, '65.
				33	Beer, A. G., Pt., D, 26th Ohio.	De. 31, '62, Jan. 1, '63.	Left. Surg. M. M. Stimmel, 26th Ohio. Disch'd Aug. 9, 1863.

No.	Name, Military Description, and Age.	Dates.	Operations, Operators, Result.
34	Beers, B., Pt., D, 69th Ohio, age 21.	Nov. 25, 27, '63.	Right; circ. Disch'd May 20, 1864.
35	Beers, J. B., Pt., E, 146th New York, age 29.	Sept. 16, 17, '64.	Right; circ. Surg. A. A. White, 8th Md. Disch'd March 23, '65.
36	Bennett, M., Pt., B, 125th New York.	Mar. 31, 31, '65.	Left; flap. Surg. W. S. Cooper, 125th N. Y. Disch'd Aug. 12, '65.
37	Bennett, R. H., Pt., D, 7th C. Troops, age 23.	Sept. 29, 30, '64.	Right; flap. Disch'd May 17, 1865.
38	Benson, L. W., Pt., I, 16th Conn., age 40.	Sept. 17, 19, '62.	Right; flap. Surg. A. S. Warner, 16th Conn. Disch'd Jan. 23, '63.
39	Berg, M., Pt., B, 7th Kansas Cavalry.	Dec. 24, 24, '62.	Left. Discharged April 7, 1863.
40	Biddle, A. H., Pt., K, 24th New Jersey.	Dec. 13, 14, '62.	Left. Discharged June 29, 1863.
41	Biggert, H., Pt., L, 15th Penn. Cavalry.	July 2, 2, '63.	Right; flap. Surg. J. W. Alexander, 15th Pennsylvania Cavalry. Disch'd June 16, 1864.
42	Bitten, L. C., Pt., K, 1st U. S. S. S., age 21.	May 31, 31, '64.	R't; circ. Surg. G. M. Brennan, 1st Sharpshooters. Disch'd Sept. 13, 1864. Re amp. April 7, '66.
43	Bixby, L. C., Pt., G, 45th Illinois.	Feb. 11, 11, '62.	Right; flap. June, 1862, re-amp. Disch'd July 23, 1862.
44	Blake, J., Pt., K, 20th Massachusetts.	Dec. 13, 15, '62.	Left. Surg. N. Hayward, 20th Mass. Disch'd Oct. 1, 1863.
45	*Blakeley, H. P.*, Pt., F, 14th South Carolina.	July 2, 3, '63.	Right. Confederate surgeon. Paroled Sept. 5, 1863.
46	Blakla, W., Pt., E, 46th New York, age 29.	Aug. 16, 16, '64.	Right; flap. Surg. W. B. Fox, 8th Michigan. Discharged.
47	Blevins, J., Pt., E, 49th Illinois, age 21.	April 9, 9, '64.	Right; ant. post. flap. Surg. G. L. Lucas, 47th Ill. Mustered out Sept. 9, 1865.
48	Bloxon, W. N., Pt., E, 22d C. Troops, age 20.	Sept. 7, 8, '64.	Left; flap. Disch'd May 26, '65.
49	Bocklay, H., Pt., D, 2d Maryland, age 22.	Dec. 13, 13, '62.	Right; circular. Disch'd April 21, 1863.
50	Bodley, C., Corp'l, K, 28th Iowa, age 24.	May 16, 16, '63.	Right; flap. Disch'd June 16, 1865. Died June 17, 1870.
51	Boehme, F., Pt., C, 20th Mass., age 27.	May 6, 7, '64.	Left; circ. Confederate surgeon. Discharged. 1870, stump good.
52	Bond, J. D. M., Pt., C, 78th Ill., age 28.	Sept. 1, 2, '64.	Right; flap. Surg. T. B. Williams. 121st Ohio. Disch'd May 6, '65.
53	*Bonedun, C. W.*, Pt., G, 7th Virginia Cavalry.	July 1, 1, '63.	Left. Union surgeon. Recovery.
54	Book, G., Pt., E, 6th Colored Troops.	Feb. 11, 11, '65.	Left; circ. Surg. N. S. Barnes, U. S. V. Recovery May 6, 1865.
55	Booth, J. L., Pt., B, 12th W. Virginia, age 22.	June 13, 14, '63.	Right; ant. post. flap. Confed. surgeon. Disch'd May 15, '65.
56	Boucher, P., Pt., I, 28th Massachusetts, age 26.	June 3, 3, '64.	Right; lateral flaps. Surg. P. E. Hubon, 28th Mass. Disch'd Nov. 28, 1864.
57	Bowen, J., Pt., C, 42d Illinois, age 21.	Dec. 30, 31, '62.	Right. Surg. T. D. Fitch, 42d Illinois. Hæm. June 20, 1863, amp. thigh. Dis. April 28, 1864.
58	Bowland, W., Pt., C, 142d New York, age 21.	Oct. 13, 13, '64.	Left; flap. Surg. D. McFalls, 142d N. Y. Gang. Oct. 27, re-amput'n. Disch'd Sept. 11, '65.
59	Bowman, H. A., Pt., G, 2d N. Hampshire.	July 21, 23, '61.	Left; flap. Surg. E. T. Perkins. 71st N. Y. S. M. Disch'd Nov. 1, 1861.
60	*Boyd, J. E.*, Pt., I, 44th Tennessee.	Dec. 14, 14, '63.	Right. Surgeon G. McDonald, 22d Virginia. Recovery.
61	Bradin, R., Lieut., E, 7th N. York Heavy Artillery, age 34.	June 16, 17, '64.	Right; ant. post. flap. Surg. J. E. Pomfret, 7th N. Y. H'vy Art. Disch'd January 27, 1865.
62	*Bragg, J. W.*, Pt., G, 25th Virginia.	Dec. 13, 13, '61.	——. Surg. — Blandy, C. S. A. Recovery.
63	Braillie, J., Pt., A, 1st Artillery, age 33.	July 3, 3, '63.	Right; circ. Disch'd February 29, 1864.
64	Brannon, P., Pt., E, 28th Illinois.	Oct. 5, 5, '62.	Left. Surg. W. F. West, 28th Illinois. Disch'd April 7, 1863.
65	*Brantley, L. G.*, Pt., C, 33d North Carolina.	July 3, 4, '63.	Left. Surg. J. A. Vigae, 33d N. Carolina. Recovery.
66	Bray, P., Pt., G, 1st Massachusetts H'vy Artillery, age 33.	Oct. 2, 4, '64.	Right; circ. Surg. O. Everts, 20th Indiana. Gangrene. Discharged June 14, 1865.
67	Bremenkamp, F., Pt., A, 9th Illinois.	April 6, 7, '62.	Left; circular. Disch'd March 13, 1863.
68	Bridgem, L. H., Serg't, H, 26th New Jersey.	May 3, 3, '63.	Right. Disch'd Sept. 15, 1863.
69	Britting, J., Pt., E, 116th New York, age 19.	Oct. 19, 20, '64.	Right; flap. Discharged Aug. 1, 1865.
70	Bronson, D., Pt., H, 6th N. Y. Artillery, age 29.	May 30, 31, '64.	Right; ant. post. skin flap; circ. sect. mus. Disch'd Feb. 25, '65.
71	Bronson, J. B., Pt., I, 14th Ohio, age 18.	Aug. 5, 5, '64.	Right. Surg. G. E. Sloat, 14th Ohio. Amputation thigh. Discharged June 21, 1865.
72	Brookings, D., Serg't, H, 17th Maine, age 22.	June 16, 16, '64.	Right; ant. skin and post. muse. flaps. Disch'd Jan. 10, 1865. Died Dec. 6, 1870.
73	Brotherson, C., Pt., G, 151st N. Y., age 30.	Sept. 19, 19, '64.	Left; ant. post. flap. Discharged August 11, 1865.
74	Brott, J. C., Pt., B, 2d N. Y. H'vy Art., age 24.	June 2, 2, '64.	Left; circ. Surg. G. L. Potter, 145th Penn. Recovery.
75	Brower, H. H., Serg't, D, 10th N. Y., age 21.	May 10, 10, '64.	Right; flap. Surg. M. Rizer, 72d Penn. May 15, amputation leg. Disch'd Nov. 2, 1865.
76	Brown, C. K., Pt., A, 7th Wisconsin, age 24.	May 8, 9, '64.	Left; circ. Surg. A. J. Ward, 2d Wis. Disch'd July 16, 1864. Feb. 6, '65, amp. leg. Recovery.
77	*Brown, J. M.*, Pt., D, 5th Alabama, age 28.	July 2, 2, '63.	Right. A. Surg. T. C. Hill, 5th Ala. Paroled Sept. 25, 1863.
78	Brown, W. M., Pt., F, 91st Ohio, age 23.	July 20, 21, '64.	Left; ant. post. flap. A. Surg. A. Titus, 31st W. Virginia Cavalry. Disch'd January 31, 1865.
79	Bullard, F. W., Pt., B, 57th Mass., age 19.	May 6, 8, '64.	Left; flap. Confederate surgeon. July 7, 1865, re-amputation leg. Disch'd Nov. 23, 1865.

892	*Weaver, T.*, Pt., H, 66th Georgia, age 25.	Nov. 30, Dec. 1, '64.	Right; circular.

Primary Amputations in the Lower Third of the Leg for Shot Injury.—There appear on the records of this Office nine hundred examples of primary amputation in the lower third of the leg. Six hundred and seventy-six terminated successfully, two hundred and fifteen fatally, and the results in nine instances are not recorded, a fatality of 24.1 per cent., exceeding the mortality of the primary amputations in the middle third 7.2 per cent.

Successful Primary Amputations in the Lower Third of the Bones of the Leg.—The six hundred and seventy-six operations of this group were performed on six hundred and seventy-three patients, three being amputations of both limbs. Five hundred and thirty-two were Union and one hundred and forty-one were Confederate soldiers. Of the former, five hundred and twenty-eight were pensioned or placed on the retired list; forty-three of these have died since the date of their discharge. In fifty-two instances re-amputation in the leg and in six amputation in the thigh was subsequently performed.

Case 740.—Lieutenant E. F. O'Brien, Co. A, 28th Massachusetts, aged 29 years, was wounded at Cold Harbor, June 3, 1864. Surgeon W. S. Cooper, 125th New York, reported his admission to the field hospital of the 1st division, Second Corps, with "shot fracture involving the left ankle; leg amputated at lower third by Surgeon P. E. Hubon, 28th Massachusetts." Five days after the reception of the injury the patient entered Armory Square Hospital, Washington, and one month later he proceeded to his home on leave of absence. He was discharged from service October 13, 1864, and afterwards entered the Veteran Reserve Corps, in which organization he served until April 17, 1867, when he was mustered out and pensioned. Subsequently he obtained employment as clerk in the Post Office and Interior Departments at Washington. In May, 1869, when visiting the Army Medical Museum, he was in excellent health, and stated that he had worn a "Salem" artificial leg with satisfaction for over five years. In his application for a new artificial limb, supplied in 1880, the pensioner reports the stump as continuing in "very good condition." His pension was paid September 4, 1880. The amputated bones of the leg, together with the astragalus (*Spec.* 4494, *Surg. Sect.*, A. M. M.), were contributed to the Museum by the operator, and are represented in the wood-cut (Fig. 290), showing the tibia to be shattered into the ankle and the fibula fractured transversely.

Fig. 290.—The lower portion of the bones of the left leg and the astragalus. The tibia is shattered into the ankle. *Spec.* 4494.

Case 741.—Lieutenant Robert Catlin, 5th U. S. Artillery, was wounded in an engagement on the Weldon Railroad, near Petersburg, August 21, 1864, by a twelve-pound round shot which crushed his left foot. Three hours after the reception of the injury the limb was amputated in the lower third, by circular incision, by Surgeon W. B. Fox, 8th Michigan. The wound healed rapidly, and Lieutenant Catlin was able to be about in a month. Dr. S. Weir Mitchell,[3] who had the patient under treatment for a period of three years on account of neuralgia of the leg stump, published an

[3] Mitchell (S. W.), *The Relations of Pain to Weather, being a study of the natural history of a case of Traumatic Neuralgia*, in *American Journal of Medical Sciences*, 1877, Vol. LXXIII, p. 306.

elaborate account of the results of his observations. In July, 1866, Lieutenant Catlin was promoted Captain. Dr. John H. Brinton, in the spring of 1875, at the request of Dr. Mitchell, exsected one and a half inches of the peroneal nerves, but without material influence on the neuralgic pains. The patient was furnished with an artificial limb by A. A. Marks, of New York. He was placed on the retired list as captain December 15, 1870.

CASE 742.—Private J. Cavanaugh, Co. C, 7th Wisconsin, aged 27 years, was wounded before Petersburg, June 18, 1864, by a shell, which caused a fracture of the lower portion of the left leg, involving the ankle joint. Surgeon C. N. Chamberlain, U. S. V., reported that the injured leg was amputated at the field hospital of the 4th division, Fifth Corps. Surgeon B. B. Wilson, U. S. V., contributed the pathological specimen, No. 1526, *Surg. Sect.*, A. M. M., shown in the adjoining wood-cut (FIG. 291), and reported the following history of the case: "The patient was admitted to Stanton Hospital, Washington, from City Point, July 1st. He had suffered amputation of the leg at the lower third, by the circular method, the day after he was wounded, being, according to his statement, in a high fever at the time of the operation. He was treated with stimulants, and ice dressings locally. During the month of September the limb became much swollen and abscesses formed in the line of the middle third of the bone, which, after discharging, left fistulous openings, clearly indicating necrosis of the shaft of the tibia. His term of service having expired, the patient was discharged October 5, 1864, but being unable to leave, he was retained as a patient in the hospital. The shaft of the tibia being evidently extensively necrosed, I determined to perform another amputation above the diseased portion. This operation—though opposed by the medical staff of this hospital and by Surgeon A. N. Dougherty, U. S. V., as well as Surgeon T. F. Betton, 1st U. S. V. V., who saw the case—was preferred by me to that of exsecting the sequestrum for the reason that it involved no more danger and would give the patient a much better stump (though six inches shorter) for fitting an artificial limb. The operation was performed one inch below the tubercle of the tibia, by the circular method, on February 25, 1865, and the stump was treated with cold-water dressings. Traumatic erysipelas followed (an epidemic of erysipelas breaking out in the hospital the same week), and for a few days fears were apprehended as to the result. The patient, however, made a good recovery, and by March 15th the inflammation, which had extended to the abdomen, had subsided. Before he finally left the hospital the patient received an artificial limb, on which he walked with great ease and comfort. The specimen indicates clearly and in a marked degree the efforts of nature in throwing off dead bone and supplying its place by new growth. The adventitious process, thrown out to unite the amputated ends of the tibia and fibula and thus give the extremities of those two bones firmness and solidity, shows to how great an extent the reparative process can be carried. By what agency the want of bony matter at this point was perceived and its deposit determined at the proper place and in the proper form is beyond the scope of human knowledge at the present time. The fact, however, evidences the powers of nature to accommodate herself to circumstances and to repair in a limited degree the effects of losses which are irremediable." The specimen, consisting of the re-amputated stumps of the bones of the leg joined by osseous deposit at their lower extremities, shows a massive involucrum except on the anterior border, where a heavy sequestrum is visible. The patient became a pensioner after leaving the hospital. On September 2, 1874, he was examined by Dr. C. F. Falley, pension examiner at Lancaster, Wisconsin, who certified to the loss of the leg and reported: "The amputation has left rather an irritable stump, but, as his cork leg does not press on it, I do not think it any great injury in wearing an artificial limb. He can flex and extend the stump freely," etc. The pensioner was paid March 4, 1880. In his application for an artificial leg he reported that Surgeon D. C. Ayres, 7th Wisconsin, performed the first amputation.

FIG. 291.—Six ins. of the stump of the bones of the left leg, showing a massive involucrum. *Spec.* 1526.

CASE 743.—Private F. Grahame, Co. A, 6th Wisconsin, aged 26 years, was wounded at Spottsylvania, May 10, 1864. Surgeon C. N. Chamberlain, U. S. V., reported his admission to the field hospital of the 4th division, Fifth Corps, with "shot fracture of right ankle joint, followed by amputation of leg at lower third." The wounded man was conveyed to Armory Square Hospital, Washington, several days after the reception of the injury, and two months later he was transferred to Harvey Hospital at Madison, where, on September 7th, a second operation was performed by Surgeon H. Culbertson, U. S. V., who made the following report: "The stump of the tibia became necrosed from the lower end to its tuberosity. New bone formed, but the necrosed portion was not separating. There were several cloacæ, and the lower end of the tibia projected through the soft parts of the stump. The patient was in an anæmic condition and his system was failing from the constant discharge and reflex irritation from the diseased stump. Designing to resect the diseased tibia, I made an incision from the tuberosity of the bone down to its lower extremity, but on separating the soft parts I found the disease so extensive as to lead me to amputate by a short anterior and a long posterior flap at the tuberosity of the tibia. In notching the tibia the periosteum was pushed back, the notch sawed off, and the periosteum laid over the surface of the bone. The anterior and posterior tibial arteries were ligated. Simple dressings were applied after the operation, and quinine and iron was administered. The sutures were removed on the fifth day and the ligatures came away on the fourteenth day. The wound steadily healed." The re-amputated stump of the tibia and fibula (*Spec.* 3696, *Surg. Sect.*, A. M. M.), the latter being well rounded and united at its extremity with the former, were contributed to the Museum by the operator, and are represented in the wood-cut (FIG. 292). The specimen shows a sequestrum in the tibia six inches long; over the upper part of the anterior border the involucrum is wanting. The patient was discharged from service August 22, 1865, and pensioned, having been previously furnished with a "Bly" artificial leg. In his application for commutation he described the stump as continuing in "healthy condition." This pensioner was paid March 4, 1880.

FIG. 292.—Re-amputated portions of the right tibia and fibula. *Spec.* 3696.

In the following instance both legs were amputated in the lower thirds on the day of the injury. The patient survived the operation ten years:

CASE 744.—Private D. Lee, Co. G, 2d New York Artillery, aged 20 years, was wounded in both legs by a shell during the siege of Petersburg, June 16, 1864, and entered Harewood Hospital, Washington, six days afterwards. Surgeon R. B.

Bontecou, U. S. V., reported: "The patient had both legs amputated by Assistant Surgeon O. S. Paine, 2d New York Artillery, on the day he was wounded, the operation being performed by the circular method at the lower thirds. He stated that he was in good health at the time of the operation. At the time of his admission he was suffering from diarrhœa, and there were symptoms of gangrene in the stump of the right leg, the tibia and fibula protruding; granulations of stump of left leg not very good. The treatment was supporting, and included opiates, astringents, and the external application of solution of chloride of lime to the gangrenous stump. By June 26th the patient was improving and the granulations had become healthy." He was subsequently transferred to the General Hospital at Rochester, discharged May 31, 1865, and pensioned, having been previously furnished with artificial legs of the "Bly" pattern. In his application for artificial limbs, dated 1870, the pensioner described the stumps as being in a "sound condition." He died September 25, 1874. Though the immediate cause of his death was not ascertained, the pensioner's health had been reported as having become very much impaired.

Fatal Primary Amputations in the Lower Third of the Leg.—Two of the two hundred and fifteen operations of this group were double amputations; the operations were therefore performed on two hundred and thirteen patients,—one hundred and ninety-one Union and twenty-two Confederate soldiers. Re-amputation in the leg was performed in seven and amputation in the thigh in two instances.

CASE 745.—Private *W. J. Holmes*, Co. G, 33d Mississippi, aged 18 years, was wounded in the left leg, at the engagement of Peachtree Creek, near Atlanta, July 20, 1864, and suffered amputation two days afterwards. About four months after losing his limb he was taken prisoner at Franklin, Tenn., whence he was conveyed to Nashville and subsequently to Louisville. Surgeon R. R. Taylor, U. S. V., who contributed two post-mortem specimens from the stump, reported the result of the case as follows: "The patient was admitted to Crittenden Hospital on December 9th. He was suffering from chronic diarrhœa, of which he died December 23, 1864. His left leg had been amputated by the circular method, at the lower third, in consequence of gunshot fracture of the lower portion of the tibia and fibula. In October a portion of the fibula came away, after which the stump healed rapidly. At the time of his death the stump was entirely well. The accompanying specimens are intended simply to illustrate the changes in the cut ends of the bones and nerves. The latter, consisting of the extremities of the posterior and anterior tibial and of the musculo-cutaneous nerves, are bulbous." The nerve portions constitute specimen 4244 of the Surgical Section of the Museum. A representation of the specimen of the bones of the stump (*Spec.* 4243, *Surg. Sect.*, A. M. M.) appears in the wood-cut (FIG. 293). In the history of the specimen on page 400 of the *Catalogue of The Surgical Section of the U. S. A. Medical Museum*, Washington, 1866, it is remarked that "though the stump is said to have been entirely healed, * * the specimen shows the extremity and posterior surface of the tibia necrosed." In a letter dated December 18, 1867, Dr. H. M. Lilly, late Acting Assistant Surgeon, states that he prepared this specimen, and adds: "I can corroborate Surgeon R. R. Taylor's statement that the stump was entirely healed. In explanation of the necrosed appearance of the end and posterior portion of the tibia, I offer the following history of the preparation of the specimen as possibly giving it the appearance of necrosis. Owing to the inconvenient arrangements of the hospital (the hospital not being finished at that date), I macerated the specimen in a tin can in my private room. Under such circumstances it was of course desirable to destroy completely all effluvium. To this end I supplied the water in the can *liberally* with the solution of permanganate salts furnished by the Medical Purveyor. May it not be that the chemical action of these salts has slightly damaged the specimen, giving it a partially necrosed appearance?"

FIG. 293.—Bony stump of left leg, five months after amputation. *Spec.* 4243.

CASE 746.—Private B. Spriggle, Co. I, 17th Pennsylvania Cavalry, aged 28 years, was wounded in the engagement near Funkstown, July 10, 1863, and entered the General Hospital at Frederick ten days afterwards. Assistant Surgeon R. F. Weir, U. S. A., reported: "He was wounded by a minié ball, which entered the outer side of the left foot just below the external malleolus, passing directly through, involving the bones of the ankle joint and emerging three-fourths of an inch below the internal malleolus. The leg was amputated at its lower third by flap operation the same day he received the injury. At the time of admission the stump looked well and there was healthy suppuration; patient doing well constitutionally, suffering none and having good appetite. He was allowed a generous diet, and in addition one-half pint of port wine daily, and the stump was dressed with adhesive plaster straps and cold-water applications. On August 4th, the flaps having firmly adhered, the straps were taken off the stump and simple cerate dressing was applied. Two days afterwards the patient was able to sit up for a few hours in a chair, and on the next day an abscess was opened which had formed near the end of the stump. The patient's appetite now had become a little depraved and he had some irritation of the stomach. During the evening of August 7th he had a severe chill, followed by some fever the next morning. Quinine and fever mixture was then prescribed and the wine continued. August 9th, pulse 106 and rather feeble; appetite not improving; some discharge still coming from the superficial abscess. On August 10th, the patient had improved a little, but the granulations were not looking very healthy and the stump was ordered to be dressed with Hay's lotion. On the following day there was another chill; pulse 130; no improvement. On August 12th, the chills continued, the tongue looking pale, and the pulse being accelerated; but the patient was apparently much better. A bandage was applied to prevent the burrowing of pus towards the knee joint. August 13th, pulse 134 and very irregular; tongue dry; patient complaining of a great deal of thirst, having some cough, and gradually sinking. Milk punch was now substituted for the wine. The next day the patient was very delirious, the pulse accelerated and threadlike; great deal of tenderness in the knee; joint doubtless involved; fluctuations detected. August 15th, patient sinking and still very delirious; pulse 156; a good deal of subsultus; very little diarrhœa; tongue red and dry; knee joint seemingly enlarging. Patient taking no nourishment but beef tea, having no relish for other food; stimulants and opiates administered in large doses. Death occurred at 11.55

A. M. on August 16, 1863. On dissecting up the integuments and opening the chest during the post-mortem examination, the lungs were found to be healthy and weighing eighteen ounces; heart normal and weighing eight ounces; liver healthy and weighing three pounds and fifteen ounces; weight of spleen seven ounces, and weight of kidneys nine ounces. On removing both bones of the leg from the point of the operation to the knee joint, a circumscribed abscess, containing about an ounce of pus, was found in the belly of the gastrocnemius muscle. The knee joint contained between three and four ounces of pus. The capsule was broken down and the pus extended up the outer side of the thigh about six inches above the joint; cartilage quite soft and commencing to erode around its edges." The bones of the stump, exhibiting a minute sequestrum, nearly separated on the carious extremity of the tibia, were contributed to the Museum by Acting Assistant Surgeon J. C. Shimer, and constitute specimen 3878 of the Surgical Section.

CASE 747.—Private A. C. Paine, Co. F, 42d New York, aged 30 years, was wounded in both lower extremities, at the battle of Gettysburg, July 3, 1863. He was admitted to the field hospital of the 3d division, Second Corps, where Surgeon I. Scott, 7th West Virginia, recorded the injury as "fracture of both feet, caused by a solid shot," necessitating "primary amputation of both legs at the lower third, which operation was performed by Surgeon H. M. McAbee, 4th Ohio." Surgeon H. Janes, U. S. V., recorded that the patient died at the Seminary Hospital, Gettysburg, July 23, 1863, from the effects of his injuries.

TABLE LXX.

Summary of Nine Hundred Cases of Primary Amputations in the Lower Third of the Leg for Shot Injuries.

[Recoveries, 1—676; Deaths, 677—891; Results unknown, 892—900.]

No.	Name, Military Description, and Age.	Dates.	Operations, Operators, Result.
1	Abbey, C. F., Serg't, C, 107th New York.	Mar. 16, 16, '65.	Left; circ. Surg. P. H. Flood, 107th N. Y. Disc'd Aug. 23, '65.
2	Abbott, H. S., Pt., D, 32d Wisconsin, age 20.	Aug. 14, 14, '64.	Right; lateral flap. Surg. J. C. Denise. 27th Ohio. Discharged July 17, 1865.
3	Allen, C., Lieut., H, 11th Wisconsin.	May 22, 23, '63.	Right. Surg. H. P. Strong, 11th Wis. Resigned Jan. 11, 1864.
4	Almany, J., Pt., B, 9th Kentucky, age 39.	Sept. 19, 20, '63.	Left; flap. Discharged January 28, 1864.
5	Amelunxen, M., Lieut., H, 68th New York.	Aug. 29, 29, '62.	Right. Surg. L. Schultz, 68th N. Y. Mar. 29, 1863, re-amp. mid. third. Disch'd Aug. 3, '63.
6	*Andrew, J. J.*, Pt., E, 26th North Carolina.	Oct. 22, 24, '64.	——. Confederate surgeon. Recovered.
7	Annand, A., Adj't, 28th Massachusetts, age 30.	May 18, 19, '64.	Left. Nov. 20, removal of necrosed bone. Disch'd May 6, '65.
8	Antis, T. S., Pt., L, 2d N. Y. M. R., age 22.	July 2, 3, '64.	Left; circ. Surg. R. T. Paine, 2d N. Y. M. R. Discharged Feb. 25, 1865.
9	Armstrong, A. H., Corp'l, A, 106th N. Y., age 22.	Sept. 19, 19, '64.	Left; flap. Surg. J. N. Freeman, 106th N. Y. Discharged.
10	Armstrong, S. J., Pt., C, 1st Michigan Cavalry.	July 14, 16, '63.	Left. Discharged December 26, 1863.
11	Augustine, A., Pt., B, 50th Pennsylvania.	Sept. 17, 17, '62.	Left; circ. Discharged Dec. 13, 1862. Died Aug. 20, 1869.
12	Auman, P., Pt., H, 211th Pennsylvania.	April 2, 2, '65.	Left; flap. Surg. W. G. Hunter, 211th Penn. Disch'd July 20, '65.
13	*Ayres, H.*, Pt., B, 27th North Carolina.	Aug. 25, 26, '64.	Left. Surg. E. L. Howard, 27th N. C. Furloughed.
14	Babb, J. A., Corp'l, K, 10th Indiana, age 24.	Aug. 3, 3, '64.	Left; circ. Discharged July 18, 1865. Died Feb. 17, 1866.
15	Babcock, E. A., Pt., G, 146th N. Y., age 18.	June 18, 18, '64.	Left; circ. Surg. T. M. Flandrau, 146th N. Y. Discharged May 18, 1865.
16	Babe, R., Pt., D, 97th Pennsylvania, age 22.	May 20, 20, '64.	Right; circ. Surg. J. R. Everhart, 97th Penn. Discharged August 20, 1864.
17	*Badger, S.*, Pt., F, 26th North Carolina, age 17.	July 1, 1, '63.	Right. Gangrene. Transferred for exchange March 3, 1864.
18	Baker, L. A., Capt., A, 39th Illinois, age 29.	Aug. 16, 16, '64.	Left. Surg. C. M. Clark, 39th Ill. Discharged Dec. 17, 1864.
19	*Baldwin, R. F.*, Lieut., F, 1st Arkansas, age 25.	Nov. 30, Dec. 1, '64.	Left; ant. post. flap. Surg. — Mitchell, 1st Ark. Transferred to Pro. Mar. Feb. 6, 1865.
20	Bales, A., Pt., A, 4th Indiana Cav., age 19.	June 1, 1, '64.	Left; circ. Asst. Surg. H. D. Garrison, 4th Ind. Cav. Discharged Nov. 1, 1864.
21	*Banton, S. A.*, Pt., K, 26th N. C., age 19.	July 2, 2, '63.	Left. Paroled Sept. 22, 1863.
22	Barber, C., Pt., F, 6th Iowa, age 28.	May 13, 13, '64.	Right; ant. post. flap. Surg. W. Lomax, 12th Ind. Discharged July 10, 1865.
23	*Barfield, T.*, Serg't, L, 8th South Carolina.	Sept. 20, 21, '63.	——. Surg. — Walker, C. S. A. Recovered.
24	*Barge, A. L.*, Corp'l, B, 28th Georgia.	Aug. 24, 24, '64.	——. Surg. — Mathis, C. S. A. Recovered.
25	Barnes, I. M., Pt., F, 83d Illinois.	Jan. 29, 29, '63.	Right; flap. Asst. Surg. J. P. McClanahan, 83d Ill. Disch'd April 10, 1864.
26	Barnes, M. J., Pt., E, 65th Illinois.	July 6, 6, '62.	Left. Surg. G. H. Parks, 65th Ill. Discharged Aug. 19, 1862.
27	Barnes, W. H., Pt., B, 3d Ohio.	Jan. 3, 4, '63.	Left; circ. Surg. W. L. Peck, 3d Ohio. Discharged.
28	Bartholomew, C. F., Pt., D, 3d Iowa.	July 12, 12, '63.	Left. Surg. J. B. Hinkle, C. S. A. Discharged Dec. 29, 1863.
29	[1]*Barwick, J. H.*, Pt., —, 6th S. C., age 20.	Sept. 17, 17, '62.	Right; circular. Doing well.
30	Bass, G., Pt., B, 34th Massachusetts, age 21.	June 5, 5, '64.	Right; circular. Discharged Oct. 17, 1864.
31	*Bass, J. C.*, Pt., I, 5th Virginia Cavalry.	Oct. 19, 19, '64.	——. Recovered.
32	Bassett, O. J., Pt., F, 70th Indiana, age 18.	June 15, 15, '64.	Right; circ. Discharged Feb. 27, 1865. Died June 10, 1872.
33	Bates, C. A., Pt., D, 57th Massachusetts, age 18.	Aug. 19, 20, '64.	Right; flap. Surg. W. V. White, 57th Mass. Disch'd Mar. 10, '65.
34	Bauvais, D., Pt., H, 97th New York, age 25.	Feb. 6, 7, '65.	Right; lateral flap. Discharged Aug. 17, 1865.
35	*Bay, M. S.*, Lieut., K, 38th N. C., age 36.	July 3, 3, '63.	——. Exchanged September 15, 1863.
36	Bayless, B. J., Pt., F, 137th N. Y., age 20.	July 20, 20, '64.	Right. Surg. E. Hutchinson, 137th N. Y. Aug. 8, '64, re-amp. at up. third. Disch'd June 16, '65.
37	Beath, R. B., Capt., G, 6th C. Troops, age 25.	Sept 29, Oct. 1, '64.	Right; circ. flap. Surg. D. G. Rush, 101st Penn. Discharged Sept. 20, 1865.
38	*Bedford, P. B.*, Corp'l, B, 50th Ga., age 36.	July 3, 4, '63.	Right. Transferred to prison December 5, 1863.
39	Beers, C. E., Serg't, G, 81st New York, age 25.	June 30, 30, '64.	Left; flap. Surg. W. H. Rice, 81st N. Y. Disch'd Dec. 29, '64.
40	Beers, E. J., Corp'l, C, 113th Ohio, age 27.	June 27, 27, '64.	Right. Surg. T. B. Williams, 121st Ohio. Re-amput'n. Discharged May 16, 1865.
41	Bell, F., Capt., I, 1st Pennsylvania Rifles.	July 3, 3, '63.	Right. Surgeon C. Bower, 6th Penn. Res. Disch'd Oct. 19, 63.
42	*Bell, J.*, Pt., G, 12th Ga. Battalion, age 26.	Sept. 19, 20, '64.	R't. Surg. S. V. D. Hill, P. A. C. S. Trans. to Pro. Mar. Apr. 1, '65.
43	Bell, J. H., Lieut., D, 61st Ohio, age 52.	July 20, 20, '64.	Left; flap. Surg. H. K. Spooner, 61st Ohio. Disch'd Dec. 15, '64. Oct. 27, '70, amp. thigh at mid. third for neuralgic aff. of stump.
44	Bencler, P., Pt., B, 74th New York, age 35.	July 2, 3, '63.	Right; circular. Discharged July 25, 1864.
45	Bennett, E. F., Pt., B, 76th Pennsylvania.	July 11, 13, '63.	Left. Confed. Surg. Necrosis. Oct. 6, amp. at mid. third. Discharged July 21, '64. *Spec.* 4308.
46	Bennett, F. H., Corp'l, G, 48th New York, age 23.	May 16, 17, '64.	Right; ant. post. flap. Surg. J. L. Mulford, 48th N. Y. Discharged May 24, 1865.
47	Bennett, G. B., Serg't, I, 3d Wisconsin, age 36.	Mar. 16, 16, '65.	Left; circ. Surg. P. H. Flood, 107th N. Y. Disch'd June 14, '65.

855	Smith, J. S., Pt., F, 2d N. Y. H'vy Art., age 17.	June 2, 2, '64.	Left; flap. Dr. A. Garcelon, of Maine. Died July 29, 1864.
856	Smith, W. H., Pt., H, 23d Penn., age 22.	June 1, 1, '64.	Left. Died June 28, 1864.
857	Southworth, W. B., Pt., F, 42d Illinois, age 25.	Nov. 25, 25, '63.	Left. Died April 2, 1864, of typhoid fever.
858	Spriggle, B., Pt., I, 17th Penn. Cavalry, age 28.	July 10, 10, '63.	Left; flap. Died August 16, '63. *Spec.* 3878.
859	Stahli, U., Pt., B, 187th Penn., age 17.	Aug. 19, 20, '64.	Left; circular. Died September 7, 1864; pyæmia.
860	Stiers, W., Pt., A, 97th Ohio.	June 22, 22, '64.	Right. Died July 27, 1864.
861	Stiteler, C., Pt., D, 16th Infantry.	Sept. 19, 19, '63.	Right. Died September 29, '63; tetanus.
862	Stover, J. H., Pt., 188th Pennsylvania, age 21.	June 1, 1, '64.	Left; ant. post. skin flap. Died June 30, 1864; gangrene.
863	Suttin, M., Pt., H, 8th N. Y. H'vy Art'y, age 28.	June 3, 3, '64.	Left. Died August 13, 1864.
864	Swinger, J., Pt., K, 130th Indiana, age 18.	Aug. 3, 3, '64.	Right. Surgeon J. W. Lawton, U. S. V. Died Sept. 1, 1864.
865	Sykes, W. E., Corp'l, G, 1st N. Y. Art'y, age 47.	May 19, 19, '64.	Left; flap. Died June 1, 1864.
866	*Taylor, W. W.*, Pt., G, 25th S. C., age 25.	Aug. 20, 21, '64.	Right; circular. Died September 12, 1864; pyæmia.
867	Taylor, W., Pt., H, 65th Ohio.	Sept. 19, 19, '63.	Left. Died October 13, 1863.
868	*Thilks, M. J.*, Pt., A, 19th Virginia.	July 2, —, '63.	Right. Died August 6, 1863.
869	Thomas, F., Corp'l, 10th Michigan.	July 14, —, '64.	——. Died July 17, 1864.
870	Tibbetts, S., Corp'l, D, 1st Me. H. A., age 29.	June 18, 20, '64.	Left; circular. A. A. Surg. O. W. Peck. Died July 30, 1864.
871	Ulmer, F., Pt., F, 189th New York.	Mar. 30, 31, '65.	Left; gangrene. Died April 28, 1865; exhaustion.
872	Van Buren, J. H., Pt., G, 2d Conn. H'vy Art'y.	Sept. 19, 19, '64.	Left; circular. Died October 7, 1864; exhaustion.
873	Vandruff, H. C., Corp'l, A, 97th Ohio.	Dec. 16, 16, '64.	Left. A. A. Surg. J. C. Thorpe. Died January 9, 1865.
874	Wakefield, W., Pt., E, 2d Ohio Cavalry, age 26.	Mar. 31, Ap. 1, '65.	Left. Surg. S. H. Plumb, 82d N. York. Died June 4, 1865.
875	Ward, T., Capt., F, 67th Ohio, age 31.	Oct. 13, 13, '64.	Left. Died October 21, 1864.
876	Wassenberg, J., Pt., I, 27th Penn., age 23.	Nov. 25, 25, '63.	Left. Surg. J. Reily, 33d N. J. Died April 19, 1864.
877	Webster, G. W., Pt., I, 7th Maryland.	May 6, 6, '64.	Left. Died May 27, 1864.
878	Welch, J. B., Pt., G, 35th Iowa.	July 14, 14, '64.	Left. Died July 19, 1864.
879	Wells, W. W., Lieut., F, 58th Penn., age 30.	May 26, 26, '64.	Left; circ. Surg. C. A. Cowgill, U. S. V. June 6, re-amputation. Died June 11, '64; exhaustion.
880	Weyman, J. B., Pt., A, 6th Kentucky, age 22.	July 20, 21, '64.	Left; circular. Died September 27, 1864; chronic diarrhœa.
881	Wheatly, J., Pt., C, 61st Ohio.	May 3, 3, '63.	Right. Died May 21, 1863.
882	Whittier, F. M., Pt., K, 14th Kentucky.	June 27, 27, '64.	Right. Died July 18, 1864.
883	Wilson, A. N., Pt., I, 5th New York.	Aug. 30, 30, '62.	Right. Died October 10, 1862.
884	Wilson, W. C., Pt., B, 4th Vermont.	Dec. 13, 13, '62.	Left. Died January 13, 1863.

In thirty-eight of the nine hundred cases of primary amputations in the lower third of the leg, the side was not reported; four hundred and sixty-nine operations involved the left, and three hundred and ninety-three the right limb. Specimens of forty cases belonging to this group are preserved in the Army Medical Museum.

Primary Amputations in the Leg for Shot Injury in which the seat of Operation was not indicated.—In five hundred and seventy-one of the three thousand three hundred and ninety-two primary amputations in the continuity of the bones of the leg the seat of the operation was not specified. The results in twenty-nine cases were not ascertained. One hundred and twenty-four operations proved successful, and four hundred and eighteen fatal, a mortality of 77.1 per cent.

Examples of Recoveries after Primary Amputations in the Continuity of the Bones of the Leg, seat of operation not specified.—The one hundred and twenty-four operations of this group were performed on one hundred and twenty-three patients, in one instance both limbs having been removed. One hundred and seventeen were Confederate and six Union soldiers:

Case 748.—Private *J. B. Barron*, Co. I, Cobb's Georgia Legion, was wounded in the leg, and captured at South Mountain, September 14, 1862. Assistant Surgeon H. A. Du Bois, U. S. A., described the injury as a "gunshot compound comminuted fracture of both bones. The man was admitted to the field hospital at Burkettsville, where amputation by the circular method was performed forty-eight hours after the reception of the wound. The patient recovered." After his recovery he was paroled and sent south. The Confederate hospital records show that he was admitted, on December 4th following, to the general hospital at Petersburg, whence he was furloughed two weeks later and proceeded to his home.

In the following instance both legs were successfully amputated by a Confederate surgeon on the day of the injury:

Case 749.—Corporal *J. W. Alexander*, Co. K, 13th Mississippi, was wounded at the battle of Fredericksburg, December 11, 1862. His injury appears recorded on a Confederate hospital register as "gunshot fracture of both legs, followed by amputation of both legs the same day by Surgeon J. T. Gilmore, C. S. A." The man recovered, and was subsequently furnished with artificial limbs by the Confederate Association for the relief of maimed soldiers.

Of the six Union soldiers one, an officer, remained in the service and was afterwards killed in battle; three were pensioned, and two do not seem to have applied for pensions; one of the pensioners died six years after the operation.

Case 750.—Lieutenant-Colonel George H. Ward, 15th Massachusetts, was wounded in the action at Ball's Bluff, October 21, 1861. Surgeon A. B. Crosby, U. S. V., states: "The wound was inflicted by a bullet; primary amputation was performed, the ankle being shattered and the circulation cut off." Lieutenant-Colonel Ward recovered, was promoted to the Colonelcy of his regiment, which he rejoined in February, 1863, and was killed at the battle of Gettysburg, July 2, 1863.

Case 751.—Private M. Higman, Co. B, 46th Pennsylvania, aged 29 years, was wounded by a shell in the right leg, at Cedar Mountain, August 9, 1862. He fell into the hands of the enemy and suffered primary amputation. Two weeks afterwards he was conveyed to the Hotel Hospital, at Piedmont, where he remained until exchanged during the following month. Surgeon R. B. McCay, U. S. V., recorded that the patient, after being paroled by the enemy, was admitted to the Chesapeake

Hospital, Fort Monroe, and Surgeon A. E. Stocker, U. S. V., reported that he was discharged January 6, 1863, by reason of "loss of right leg." He was a pensioner until June 14, 1868, when he died. The cause of his death has not been ascertained.

Fatal Cases of Primary Amputations in the Leg, seat of Operation not indicated.—This group includes four hundred and eighteen amputations performed on four hundred and twelve patients; three hundred and forty-nine were Union and sixty-three Confederate soldiers. In three instances re-amputation in the thigh became necessary.

CASE 752.—Private J. Jameson, Co. A, 29th Illinois, aged 24 years, was wounded at the battle of Spanish Fort, March 29, 1865, by the explosion of a shell, which caused flesh wounds of the left shoulder and left hip and fracture of the tibia and fibula of the right leg. Assistant Surgeon W. E. Waters, U. S. A., reported that the wounded man was admitted to the Sixteenth Corps Field Hospital, where the injured "leg was amputated by Surgeon S. L. Cheaney, 29th Illinois." Surgeon J. B. G. Baxter, U. S. V., reported the following result: "The patient entered Barracks Hospital at New Orleans eight days after being wounded. He had undergone antero-posterior flap amputation of the leg on the field. The flesh wounds were granulating feebly. Secondary hæmorrhage took place from the anterior tibial on April 4th, amounting to thirty ounces, and being controlled by manual pressure on the groin for forty-eight hours. The patient was also troubled with some diarrhœa; he had a good constitution, however. Both bones protruded from the stump, and no union of the flaps took place up to April 12th, when one inch of the fibula was resected by Assistant Surgeon E. McClintock, U. S. V., who performed the operation without using anæsthetics. The patient died April 18, 1865."

CASE 753.—Private S. Watson, Co. C, 118th Pennsylvania, was wounded in the left leg during the engagement at the crossing of the Potomac, on September 20, 1862. Surgeon E. McDonnell, U. S. V., contributed the following description of the injury and its result: "The wounded man was conveyed to the German Reformed Church Hospital at Sharpsburg, where the leg was amputated below the knee on September 21st. The operation was performed for compound fracture of the leg. On September 28th the patient's condition was favorable, but during the following two days it was critical. On October 1st, the aspect of the stump was unhealthy, the entire flap threatening to slough; no union; discharge black, sanious, and unhealthy. During the next two days he mended somewhat, and on October 4th he was much improved. The difficulty in the case was a complete falling apart of the flaps, there being no union whatever. The posterior flap was large and heavy and composed of the thick muscles of the calf of the leg, making a bad wound to heal by granulations, the bone being exposed. October 11th, the patient's system has been sinking. He has some diarrhœa and tympanitis, and was restless and delirious during the night. He must die unless the whole stump is removed by an operation above the knee, and I have become sick of amputating thighs secondarily. October 13th, condition very low; pulse at times not perceptible; jaws and body rigid. Patient had a passage from the bowels during the night and passed water quite freely. Small doses of brandy and morphine were administered; no relief. October 14th, at 8 P. M., applied a large bread poultice to stump. Hæmorrhage from stump occurred during the following night. Death at 11.30 A. M. on October 15, 1862."

TABLE LXXI.

Summary of Five Hundred and Seventy-one Cases of Primary Amputations in the Leg for Shot Injury, the point of operation unspecified.

[Recoveries, 1—124; Deaths, 125—542; Results unknown, 543—571.]

515	Varney, A. C., Pt., K, 9th Maine.	Aug. 6, 6, '63.	Left. Died August 21, 1863.
516	Virgin, A. J., Pt., K, 25th Iowa, age 25.	Jan. 11, —, '63.	Right. Died January 15, 1863.
517	Wagnor, E. R., Pt., A, 75th New York.	June 14, 14, '63.	Right. Died August 13, 1863.
518	Wales, W., Pt., F, 51st Ohio.	Dec. 31, 31, '62.	Left. Died January 7, 1863.
519	Wallack, I., Pt., G, 49th Ohio.	Nov. 24, 24, '63.	Right. Died November 27, 1863.
520	*Waller, D. J.*, —, E, 23d South Carolina.	Sept. 14, 15, '62.	——. Sept. 25, hæm.; amputat'n thigh. Died Oct. 13, 1862.
521	Walters, J. H., Pt., K, 14th New York.	Aug. 22, 22, '62.	Left; flap. Died September 3, 1862.
522	Wanzer, J., Pt., G, 12th Illinois.	April 6, 6, '62.	——. Died April 14, 1862.
523	Watson, S., Pt., C, 118th Pennsylvania.	Sept. 21, 21, '62.	Left. October 14, hæmorrhage. Died Oct. 15, 1862; tetanus.
524	Welch, W., Pt., I., 8th N. Y. H. A., age 43.	June 3, 4, '64.	Left; gangrene. Died July 13, 1864.
525	Welker, J., Pt., G, 35th Illinois.	Sept. 19, 19, '63.	Left. Died October 11, 1863.
526	Wickham, I., Pt., A, 13th Iowa.	July 22, 22, '64.	Left (also wound left arm). Died July 27, 1864.
527	Wilburn, J. C., Pt., D, 22d Kentucky.	May 23, —, '63.	Right. Died May 28, 1863; pyæmia.
528	Willey, C. W., Corp'l, C, 26th Connecticut.	June 14, 14, '63.	Left. Died June 14, 1863.
529	Williams, J. M., Corp'l, I, 69th Ohio.	Dec. 31, 31, '62.	——. Died January 24, 1863.
530	Williston, R. S., Serg't, G, 2d Massachusetts.	Aug. 9, 9, '62.	—— (also wound of hand). Died August 9, 1862.
531	Willson, J. W., Major, 14th Ohio.	Sept. 1, 1, '64.	Right. Died October 3, 1864.
532	*Winchester, W. H.*, Lt., I, 13th N. C., age 23.	July 1, 2, '63.	Left. Died August 1, 1863; pyæmia.
533	Winegar, A., Pt., F, 111th New York, age 18.	May 6, 6, '64.	Left. Died June 13, 1864.
534	Winemiller, J. C., Serg't, I., 1st Md. Cavalry.	Aug. 16, 16, '64.	Right. Died August 24, 1864.
535	Wood, E. C., Pt., B, 141st Pennsylvania.	July 3, —, '63.	Right. Died July 13, 1863.
536	Woodside, H., Pt., C, 81st Illinois.	May —, —, '63.	Left. Died July 1, 1863.
537	Worcester, J. H., Lieut., H. 7th New Hamp.	July 11, —, '63.	Left; flap. Died July 26. 1863.
538	Worcester, O. P., Pt., C, 7th Ohio.	Mar. 23, —, '62.	——. Died April 15, 1862.
539	Yantz, J., Pt., I, 9th Iowa.	Mar. 7, —, '62.	Left. Died March 12, 1862.
540	York, B. F., Pt., F, 2d Maine.	Dec. 13, 13, '62.	Right. Died December 27, 1862.
541	York, J. M., Pt., E, 66th Illinois.	May 16, 16, '64.	——. Died May 22, 1864.
542	Young, J., Pt., F, 28th Iowa.	Oct. 19, 19, '64.	Right. Died October 20, 1864.
543	*Bolman, J. W.*, Pt., G, 2d South Carolina.	Oct. 7, —, '64.	Left.
544	Boroff, J. H., Serg't, A, 123d Ohio.	June 5, —, '64.	Right.
545	*Cook*, —, Lieut.-Col., 8th Virginia Cavalry.	Jan. 11, 11, '65.	Left.
546	*Derr, A. J.*, Corp'l, C, 37th N. C., age 31.	May 3, 4, '63.	——; circular; sloughing.
547	Harrison, L., Corp'l, F, 63d Ohio.	Oct. 4, —, '62.	Left.
548	*Hemingway, T.*, Pt., B, Hampton's Legion, S.C.	Oct. 13, —, '64.	Left.
549	*James, F. M.*, Pt., B, 31st Mississippi.	July 20, —, '64.	Left.
550	*Kelley, J. W.*, Pt., G, 40th Mississippi.	July 20, —, '64.	——
551	*Lineberger, J. L.*, Pt., H, 23d North Carolina.	May 2, 2, '63.	Left. Ass't Surgeon B. Howard, U. S. A.
552	*Lisebone, J. H.*, Pt., 28th North Carolina.	July 27. —, '62.	——
553	Mason, W. A., Pt., B, 82d Ohio.	Aug. 28. —, '62.	——

558	Reedy, D. E., Pt., E, 48th Pennsylvania.	June 3, —, '64.	——
559	Rinehart, L., Pt., E, 32d Indiana.	June 20, 20, '64.	Right.
560	Robertson, A. S., Pt., —, 28th Illinois.	Oct. 5, —, '62.	——
561	Rothrock, B., Pt., B, 81st Pennsylvania.	Dec. 13, 13, '62.	Right (also wound of side and foot).
562	Scherring, H. P., Pt., —, 4th Maryland.	June 5, —, '64.	Right.
563	*Sherrill, J. M.*, Pt., D, 18th North Carolina.	——	——
564	Smith, J., Pt., D, 9th Illinois.	Oct. 4, —, '62.	——
565	*Songtitcry, J.*, Pt., E, 55th Alabama.	July 20, —, '64.	Left.
566	*Stephens, J. F.*, Pt., A, 49th Georgia, age 23.	May 3, 4, '63.	——; flap.
567	*Swaford, W. H.*, Pt., C, 33d Mississippi.	July 20, —, '64.	Left.
568	*Talifero*, —, Lieut., 9th Virginia Cavalry.	Nov. 5, 5, '62.	——
569	*Willard, J.*, Pt., A, — South Carolina.	Aug. 14, —, '64.	Right.
570	*Williams, T. J.*, Pt., H, 20th South Carolina.	July 28, —, '64.	Left.
571	*Wilson, A. W.*, Pt., C, 19th Louisiana.	July 28, —, '64.	Left.

Of the five hundred and seventy-one operations recorded in the foregoing table the amputation was performed in the right limb in one hundred and seventy-seven, in the left limb in two hundred and eight cases; in one hundred and eighty-six instances the side was not indicated.

INTERMEDIARY AMPUTATIONS IN THE CONTINUITY OF THE LEG FOR SHOT INJURY.—One thousand and forty-six of the five thousand four hundred and fifty-two amputations in the leg were intermediary operations. The results were determined in all cases; six hundred and eighty-two were followed by recovery, and three hundred and sixty-four by death, a mortality rate of 34.7 per cent., exceeding that of the primary operations (30.9 per cent.) 3.8 per cent. Two hundred and ninety-six operations were performed

[1] Holloway (J. M.), *Comparative Advantages of Pirogoff's, Syme's, and Chopart's Amputations and Excision of the Ankle Joint by Hancock's Method, after Gunshot Wounds and other Injuries*, in *American Journal Medical Sciences*, Vol. LI, p. 85.

in the upper, three hundred and sixty-eight in the middle, and three hundred and thirty-five in the lower third of the leg; in forty-seven the seat of the amputation was not indicated.

Intermediary Amputations in the Upper Third of the Leg for Shot Injury.—Two hundred and ninety-six operations were recorded; one hundred and ninety-four had successful, and one hundred and two fatal terminations, a mortality of 34.4 per cent.

Successful Intermediary Amputations in the Upper Third of the Leg.—The one hundred and ninety-four operations were performed—one on a civil employé, twenty-two on Confederate, and one hundred and seventy-one on Union soldiers. Of the latter, one officer was placed on the retired list, and one hundred and sixty-eight enlisted men became pensioners, of whom twenty have died since their discharge. In three instances the amputation in the leg was followed by amputation in the thigh.[1]

CASE 754.—Colonel F. Fessenden, 30th Maine, aged 25 years, was wounded in the right leg during an engagement near Cane River, April 23, 1864, and entered St. James (Officers') Hospital, New Orleans, six days afterwards. Assistant Surgeon S. H. Orton, U. S. A., reported: "The tibia was fractured irregularly for two and a half inches at the upper part of the middle third, two pieces of bone being entirely detached. Flap amputation at the upper third was performed on April 30th, by Surgeon F. Bacon, U. S. V.; chloroform was used. At the time of the operation the periosteum was detached, with infiltration of pus beneath the integuments down to the ankle joint. The patient's constitutional condition was good and he progressed favorably. He was granted a leave of absence, and left the hospital May 18, 1864." The specimen (3603) shown in the annexed wood-cut (FIG. 294) was contributed to the Museum by the operator, with the following supplementary description of the case: "The tibia was splintered by a glancing bullet, which did not lodge in the leg and made but a single wound in the integuments. The fibula was not fractured and has not been preserved. I first examined the wound some seven days after it had been received and was surprised—in view of its apparently small extent—to find the bones stripped of periosteum and evidently dead for a distance of several inches above and below. One of the fissures ran directly across the nutrient foramen. The artery had been ruptured at that point and considerable hæmorrhage had ensued, the blood being evidently infiltrated through the calf of the leg. To this fact I attributed the loss of vitality which had taken place even in the larger fragments of the bone. The leg was amputated without delay immediately after the examination." After leaving the hospital Colonel Fessenden returned to active service, and was promoted to Brigadier General and subsequently to Major General. He was retired from service November 1, 1866. At the battle of Shiloh, April 7, 1862, he had also been wounded in the arm.

FIG. 294.—Right tibia fractured in middle third. *Spec.* 3603.

CASE 755.—Private J. Wheeler, Co. A, 8th Connecticut, aged 23 years, was wounded at Antietam, September 17, 1862. Surgeon T. H. Squire, 89th New York, recorded his admission to the Locust Spring field hospital, near Sharpsburg, and noted the following description of the case: "The wound was through the right ankle joint by a musket ball. The leg was amputated one week after the injury by Surgeon W. H. Leonard, 51st New York, at the junction of the upper and middle thirds. The flaps sloughed and the ends of both bones became exposed, being surrounded by red granulations. By a healing process the stump slowly changed for the better, the efforts of nature being supported by treatment as good as could be, and the patient being cheerful and expecting a good recovery. On November 12th, the ends of the bones exfoliated and were taken away, after which the stump improved and the patient's general health became quite good." He subsequently passed through hospitals at Frederick, was transferred to Knight Hospital, New Haven, and finally admitted to Central Park, New York City, October 30, 1863. Acting Assistant Surgeon S. Teats reported from the latter hospital that "the stump had healed up perfectly sound by June 1, 1863; also that the patient had been discharged from service November 17, 1863, and received an artificial leg. The man has been paid as a pensioner to September 4, 1880. In his application for commutation, dated 1875, he described the stump as being "very uneven and sensitive;" but five years later he reported its condition as "sound." A plaster cast of the stump (*Spec.* 2746), contributed by Assistant Surgeon J. W. S. Gouley, U. S. A., is represented in the annexed wood-cut (FIG. 295). The specimen indicates the amputation to have been performed by the posterior flap, while the cicatrices resemble those following a circular operation. The integument on the anterior surface appears tightly drawn over the bone.

FIG. 295.—Stump after flap amputation at junction of upper and middle thirds of leg. *Spec.* 2746.

CASE 756.—Brigadier-General H. E. Payne, U. S. V., aged 37 years, was wounded at Port Hudson, June 14, 1863. He was conveyed to the field hospital of the 3d division, Nineteenth Corps, whence Surgeon S. C. Hartwell, 38th Massachusetts, reported: "Shot wound of left leg." Two days after the reception of the injury, which involved the fracture of both bones of the leg, he was conveyed to New Orleans, whence Dr. P. C. Boyer reported that the patient "was under treatment at the Hotel Dieu Hospital from June 16th to July 22d for gunshot wound of leg and amputation." The operation was performed by Dr.

[1] Two of the operations were done in the middle third of the thigh: Cases of Pt. A. J. Cheever, H, 16th Mass. (TABLE XXXV, No. 35, p. 280, *ante*): Corporal H. W. Hughes, I, 133d New York (TABLE XXXIX, No. 43, p. 314, *ante*); and one in the lower third: Pt. F. Hoffman, H, 2d Penn. Artillery (TABLE XL, No. 47, p. 320).

Warren Stone, of New Orleans, on June 23d, four inches below the knee; the patient entirely recovered and became able to walk with the aid of an artificial limb. General Paine ultimately resigned his commission May 15, 1865, after which he was pensioned. Since leaving the service he has served as a member of Congress, and has been Commissioner of Patents.

CASE 757.—Private A. Rutter, Co. C, 100th Pennsylvania, aged 20 years, was wounded, at Bethesda Church, June 2, 1864. Surgeon M. K. Hogan, U. S. V., reported his admission to the field hospital of the 1st division, Ninth Corps, with "shot fracture of right leg by minié ball." Surgeon G. L. Pancoast, U. S. V., who amputated the limb, made the following report: "The wounded man was admitted to Finley Hospital, Washington, on June 15th, from the field hospital. His injury consisted of a compound comminuted fracture of the right tibia, for which amputation was performed at the upper third on June 20th. The operation was done by the flap method and chloroform was used as the anæsthetic, the patient's general condition being excellent. After two days of suffering the patient's progress of recovery was rapid. Cold-water dressings were applied." A part of the amputated tibia (*Spec.* 2587), showing fracture in the upper third and exhibiting well-marked necrosis, was contributed by the operator and is represented in the wood-cut (FIG. 296). The patient was subsequently transferred to Judiciary Square Hospital, where, after being furnished with an artificial limb by Jewett's Patent Leg Co., he was discharged from service May 4, 1865, and pensioned. His pension was paid June 4, 1880. In his applications for commutation he reported the condition of the stump as continuing "all right."

FIG. 296.—Fractured portion of right tibia; necrosis. *Sp.* 2587.

CASE 758.—Sergeant W. F. Johnson, Co. H, 84th Illinois, aged 19 years, was wounded in the right leg, at Dallas, May 30, 1864. Surgeon J. D. Brumley, U. S. V., reported his admission to the field hospital of the 1st division, Fourth Corps, with "shot fracture of tibia, lower third." Assistant Surgeon C. C. Byrne, U. S. A., who amputated the limb at the Field General Hospital at Chattanooga, made the following report: "The wounded man was admitted June 6th, and on the following day circular amputation was performed at the junction of the upper and middle thirds of the leg. Chloroform constituted the anæsthetic. The patient's constitutional condition at the time of the operation was good, but the injured parts were swollen, infiltrated, and œdematous, and there was some erysipelatous inflammation. Two days afterwards the parts assumed a decidedly gangrenous appearance, and the pus become fetid, black, and profuse. This rapidly increased, though liquor of chlorinate of soda was freely applied. On the third day pure bromine was applied, which arrested it. A second application gave the parts a healthy aspect, granulations springing up at once. Tonics and stimulants were given internally." On August 29th, the patient was transferred to hospital No. 19, at Nashville, where he obtained a furlough and was allowed to proceed to his home. In the following November he entered the Post Hospital at Rock Island, whence Acting Assistant Surgeon P. Gregg reported that "either in consequence of deficient flap or subsequent sloughing the bones protruded and became necrosed. It was deemed necessary by Surgeon W. Watson, U. S. V., in charge, and myself to re-amputate. I performed the operation on May 17, 1865. It was necessary to remove the head of the fibula. The joint is useless for any practical purpose." The patient was discharged from service August 10, 1865, and pensioned, since when he has been supplied with artificial limbs at stated intervals. Surgeon G. G. Craig, of Rock Island, who examined the stump on February 9, 1877, reported that "the patella and a portion only of the head of the tibia are remaining, which are drawn back and anchylosed." The pensioner was paid June 4, 1880.

CASE 759.—Lieutenant-Colonel E. P. Taft, 9th New York Heavy Artillery, aged 32 years, was wounded in the left leg, at the battle of Monocacy, July 9, 1864. Assistant Surgeon T. H. Helsby, U. S. A., reported: "The patient was admitted to hospital at Frederick the day after receiving the injury, which consisted of a fracture of the tibia and fibula in the lower third, caused by a conical bullet. Buck's extension apparatus was applied, with water dressings to the wound, and a generous diet was ordered. Secondary hæmorrhage having occurred from the posterior tibial artery, it became necessary on July 22d to amputate the limb. The operation was performed by Assistant Surgeon R. F. Weir, U. S. A., in the upper third, near the tubercle, by the circular method. At the time of the operation the parts were in an unfavorable condition from fading erysipelas and loss of blood, and the constitutional state of the patient was anæmic and depressed. Simple dressing was applied and a good diet administered. Secondary hæmorrhage occurred from the stump on July 24th, for which the popliteal artery was ligated in the stump. Moderate sloughing was arrested by the application of a solution of permanganate of potash, and the after treatment consisted of quinine, porter, and stimulants. On September 7th, the patient received a leave of absence. When he left the hospital he was in fine spirits, his appetite and general condition was good, and the stump looked healthy and was almost healed." The amputated bones of the leg (*Spec.* 3926), showing the tibia to be shattered and the fibula fractured transversely, were forwarded to the Museum by the operator and are represented in the wood-cut (FIG. 297). Lieutenant-Colonel Taft was mustered out November 28, 1864, and subsequently re-commissioned as Colonel. He became a pensioner after being ultimately discharged from service. Dr. William G. David, of Lyons, N. Y., who testified that he was the attending physician of the pensioner, reported that "the shock to his constitution from the wound and loss of the limb, as well as the long-continued and excessive discharge from the stump, so prostrated and reduced him that he never recovered his health, but continued anæmic, and died of dropsy on January 20, 1867."

FIG. 297.—Lower third, left leg: tibia shattered and fibula transversely fractured. *Spec.* 3926.

Fatal Intermediary Amputations in the Upper Third of the Leg.—The operations belonging to this group number one hundred and two—fifteen performed on Confederate and eighty-seven on Union soldiers. Erysipelas was noted in five, tetanus in six, gangrene in eighteen, and pyæmia in nineteen instances. Specimens in twenty-two of the cases are preserved in the Army Medical Museum.

CASE 760.—Private J. N. Coder, Co. K, 46th Pennsylvania, was wounded in the left leg, at Cedar Mountain, August 9, 1862. He was admitted to Wolfe Street Hospital, Alexandria, five days afterwards, where amputation was performed by Acting Assistant Surgeon S. E. Fuller, who reported the following history: "A rifle ball passed through the leg, fracturing the tibia about its middle. The limb was amputated three inches below the knee joint by the circular method, by order of Surgeon J. E. Summers, U. S. A., in charge of the hospital, on August 27th. Three days after the operation the stump had become much swollen, with red streaks extending up the limb; no suppuration. Quinine and brandy were ordered internally and warm-water dressings were applied to the stump. August 31st, patient much the same; treatment continued, and limb painted with muriated tincture of iron as far as the redness extended. September 1st, swelling great and no suppuration; sutures removed and some thick dark-colored fetid matter washed out of the stump. September 4th, redness disappeared; swelling less; no suppuration; treatment continued. On September 7th some sloughing of the stump appeared, when lint wet with solution of chloride of soda was applied, and the parts were occasionally touched with nitric acid. On September 14th about two inches of the soft parts came entirely away, leaving a granulating surface, and the patient appeared better and had good appetite. On September 16th, I called at 2 A. M., found the peroneal artery bleeding freely, and applied a tourniquet to the femoral, giving brandy and opium internally. There was no return of the hæmorrhage, but the patient gradually sank, and died September 19, 1862." The amputated tibia, showing periostitis to have covered the shaft with a delicate coating of callus, was contributed by the operator, and is specimen 321 of the Surgical Section A. M. M.

CASE 761.—Private G. Kimmel, Battery I, 1st New York Light Artillery, was wounded in the right leg, at Chancellorsville, May 3, 1863. Assistant Surgeon J. R. Smith, 136th New York, recorded the wounded man's admission to the field hospital of the 2d division, Eleventh Corps, May 15th, and his "death from pyæmia, after amputation of the leg below the knee, June 3, 1863." Surgeon R. Thomaine, 29th New York, who contributed the specimen (No. 1542) shown in the adjoining wood-cut (FIG. 298), reported that the attempt was made to save the leg, but amputation had to be performed thirteen days after the reception of the injury on account of suppuration. The specimen consists of the amputated bones of the leg, exhibiting the tibia to be shattered in the upper third, and showing a decided effort of nature to throw off the dead bone.

FIG. 298.—Portions of bones of right leg; tibia fractured in upper third. *Spec.* 1542.

CASE 762.—Private E. Williams, Co. F, 136th Pennsylvania, aged 45 years, was wounded at Fredericksburg, December 13, 1862. Surgeon C. J. Nordquist, 83d New York, reported his admission to the field hospital of the 2d division, First Corps, with "shot wound of right leg." Surgeon O. A. Judson, U. S. V., contributed the pathological specimen with the following description: "The wound was caused by a minié ball entering the upper part of the middle third of the tibia, passing obliquely downward and backward, fracturing the bone in its course and wounding the anterior tibial artery, and emerging through the gastrocnemius muscle. The patient was admitted to Carver Hospital, Washington, December 21st. The leg was placed in a fracture box and the bone kept well in apposition. Water dressings were applied. The patient progressed favorably until December 28th, when a profuse and continually recurring hæmorrhage set in which resisted ordinary measures for its control. Amputation was accordingly resorted to, and performed at the upper third of the leg by flap operation. On January 1, 1863, hæmorrhage to the amount of thirty ounces occurred from the anterior tibial artery in the stump, which was laid open and the bleeding vessel was secured. But the patient gradually sank, and died the evening of the same day. His system was also infected with pyæmia. Examination revealed an oblique fracture of the tibia, also that a piece of bone had been driven into the anterior tibial artery. The inter-muscular tissues of the limb were distended by pus." The wood-cut (FIG. 299) is a representation of the amputated shaft of the tibia (*Spec.* 634), which was comminuted in the middle third but shows very little displacement of fragments.

FIG. 299.—Fracture in middle third of right tibia. *Spec.* 634.

TABLE LXXII.

Summary of Two Hundred and Ninety-six Cases of Intermediary Amputations in the Upper Third of the Leg for Shot Injuries.

[Recoveries, 1—194; Deaths, 195—296.]

No.	NAME, MILITARY DESCRIPTION, AND AGE.	DATES.	OPERATIONS, OPERATORS, RESULT.	No.	NAME, MILITARY DESCRIPTION, AND AGE.	DATES.	OPERATIONS, OPERATORS, RESULT.
1	Adams, W. J., Pt., A, 12th Ohio.	Sept. 14, 17, '62.	Right. Discharged Nov. 29, 1862. Suicide January 4, 1870.	9	Barron, J. G., Pt., C, 4th Artillery, age 19.	May 3, 18, '63.	Left; flap. Surg. C. S. Wood, 66th New York. Discharged August 20, 1863.
2	Ames, G. W., Pt., E, 3d Michigan, age 20.	Aug. 30, Sept. 15, 1862.	Left; circular. A. A. Surg. R. Ottman. Discharged July 26, 1863.	10	Barrows, H. C., Pt., F, 9th Maine.	July 18, 21, '63.	Left; circ. Confederate surgeon. Discharged March 8, 1864.
3	*Antry, W. W.*, Serg't, C, 24th N. C., age 25.	April 6, 9, '65.	Left; circular. To prison April 17, 1865.	11	Beaty, M., Pt., C, 149th New York.	May 3, 16, '63.	Right. Ass't Surg. D. H. Strickland, 111th Penn. Discharged March 31, 1864. *Spec.* 1271.
4	Armstrong, R., Pt., G, 14th Infantry, age 23.	July 2, 9, '63.	Left (also wound left arm); post. flap. Ass't Surg. W. R. Ramsay, U. S. A. Disch'd Sept. 15, 1863.	12	Beehtel, H., Pt., I, 51st Indiana, age 24.	Dec. 16, 21, '64.	Left; ant. post. flap; gangrene. Discharged June 27, 1865.
5	Arnold, L., Pt., G, 143d Pennsylvania, age 20.	May 25, 29, '64.	Right (May 25, exo'n tibia): flap. A. A. Surg. C. Darby. Disch'd June 17, 1865.	13	Beckel, M., Pt., A, 25th Illinois.	Dec.31,'62, Jan.6,'63.	Right. Surg. J. Blount, 25th Ill. Discharged July 20, 1863.
